And here we must enter somewhat more fully into that peculiar phenomenon of the utter dissimilarity in the characters of the Greek and Roman religion, at which we have hinted already—a dissimilarity all the more surprising, as the self-same symbolical and allegorical views of nature, filtered through however different channels, form the foundation of both. Both also—especially in their later stages—offer a general analogy not only of deities and spirits, but even of holy places and their mode of worship. But the fact is, that they each took the originally common stock of notions and conceptions, clad more or less in mythical garb, and utterly transformed it, superadding to it from time to time according to their own distinct nationality. It is here, however, that their characteristic traits come out in as forcible a contrast as they do in every other relation of life, in their art and culture, in their states and families. While to the Hellenes the individual was the chief end of all things, and the state existed for the citizen, and the ideal was the *Kalokagathia*, the beautiful, good, the Romans imposed, as the highest duty, submission to authority—the son to the father, the citizen to the ruler, and all to the gods. To them, only that which was useful appeared good. Idleness was not to be tolerated in a community where every single member only existed as far as it contributed to the greatness and aggrandisement of the commonwealth. Hence, with them, a rational thoughtfulness, and a grand and awful austerity in their relations to men and gods; while the Greeks treated both with joyful serenity. The Greek invested his gods with human attributes, and then surrounded them with a halo of highest splendour and most glorious divine beauty; but he constantly modelled and remodelled them, until they reached the acme of beautiful perfection, as would the painter and the sculptor with their work. The Roman, on the other hand, cared nothing for the outward form of his idealised notions—the notions themselves, mere fundamental ideas, were his sole object of veneration. The Greeks made everything concrete, corporeal, and individual; the Romans,

abstract and general. The Greeks could only worship allegories; the Romans, abstractions. Hence, also, their utter discarding of many of the myths common to the whole Indo-Germanic stock, the unmarried and childless state of their gods, who, moreover, wanted no food, and did not wander about among men, as did the Indian and the Hellenic. As in the late Midrash, which has partly found its way into Christianity, there is a heavenly Jerusalem right over the earthly Jerusalem, in which all things below were reproduced in an exact but most ideal and divine manner. Thus, the Roman Pantheon was the precise counterpart of the Roman world as it existed in reality. Every man, and thing, and event, and act had a corresponding tutelary deity, that came and went with the special individual, phenomenon, or event, and eternal gods were those only that represented certain great unchanging laws of nature. The angels of the legendary lore of later Judaism and early Christianity, that protect special nations, were with the Romans the gods of these nations, and entered, as their special numina, the divine commonwealth of the Romans simultaneously with the admission of these nations into their own pale or freedom.

As long as the grand old Roman simplicity of manners, the frugality of domestic life, the indefatigable pursuit of agriculture, trade, and commerce lasted—and all of these were well characterised by the deep reverence paid to gods (albeit not in the highest scale of divine order), who presided over the house, the field, the forest, mercantile enterprise, and the like, Vesta, the Penates, the Silvani, the Lares or Lases, Hercules or Herculus (a native Italian deity, the god of the enclosed homestead [compare Jupiter *herceus*] apparently distinct from the Greek Heracles) as the god of property and gain, whose altar, as god of faith (*Deus fidius*), was as frequently to be met with as those of the goddess of chance (Fors, Fortuna), and the god of traffic (Mercury)—so long did Roman religion, properly so called, retain its firm hold over the people's minds, and its influence cannot well be overrated. But when the antique austerity, the olden spirit of grand independence, the unceasing hard work that steeled body and soul, had given way to the lazy luxurious ease of later times—then Roman religion ceased to exist in reality, and over its ruins rose a mad jumble of unbelief, Hellenism, sectarianism, and oriental creeds. The ancient *religio*, the binding faith, which had excited the admiration and astonishment of the Greeks, had waned, and in proportion with the unbelief rose the pomp, and stateliness, and luxury of public worship. To the hierarchy of augurs, oracle-keepers, and pontifices were superadded special banquet-masters for the divine banquets. The priests more and more freed themselves from taxes and other public burdens, and the custom of perpetual endowments for religious objects crept in, as their influence waxed stronger and stronger. 'Pious services' became as much an item of domestic expenditure as the cook's and nurse's wages. Penny collections for the 'mother of God' were gathered on certain fixed days by the sound of fife and drum played by priests in oriental garb, headed by a eunuch, from house to house, and the whole substance of Roman faith was transformed into an unwieldy mass of dark, grovelling mysticism and shameless profligacy, presided over by wretched gangs of uneducated and unprincipled priests. How this state of things favoured the gradual introduction of Judaism and Christianity into the dying days of imperial Rome, has been briefly sketched in Gnosticism (q. v.). Constantine the Great abolished the last outward trace of Roman religion by proclaiming Christianity as the state religion.—For the greater

part of the gods and goddesses mentioned, see special articles. See also GREEK RELIGION, ETRURIA, PELASGIANS, &c. For a fuller account of the whole subject, the reader is referred to Mommsen's *History of Rome* (Eng. transl. Lond. 1864).

ROMANESQUE ARCHITECTURE, the debased style which succeeded Roman architecture, from about the time of Constantine (350 A.D.) to that of Charlemagne (800 A.D.). It is impossible to fix the date of the style definitely, because Roman Architecture (q. v.) was itself a transitional style, and the one fades gradually into the other. When Constantine proclaimed Christianity the religion of the empire, he gave the Christians freedom of action. They could worship in public, and consequently desired buildings for their service; hence the impetus which gave architecture a new start. As explained under APSE and BASILICA, the Christians adopted the Roman hall of justice for their church or place of assembly, and erected many noble basilicas in Rome, Ravenna, and all over the empire. These consisted of three or five aisled halls—the aisles separated by rows of columns. In Rome, the columns, entablatures, and other ornaments were frequently taken from the ruins of ancient buildings which abounded there. The new style is therefore closely allied to the ancient one in the imperial city; but in Ravenna, Jerusalem, Provence, and the remoter districts, where few ancient remains exist, a simpler and ruder copy of the ancient work is found. There is always, however, a certain resemblance to the old forms which distinguishes the Romanesque from the round-arched Gothic which succeeded it. The piers along the aisles are always single columns, generally with caps intended to be Corinthian, and wide arches; the aisles are wide, with open wooden roof; and there are remnants of entablatures, mouldings, &c., which recall the ancient Roman work. The early Christians also derived their round churches from the Romans. They were probably originally tombs, copied from such buildings as the Minerva Medica (see ROMAN ARCHITECTURE), and were the most sacred places, where the burial-service was said, and the sacraments administered. Hence they afterwards became Baptisteries (q. v.), and were finally absorbed into the church (see RHENISH ARCHITECTURE), which then contained within itself everything connected with the Christian service.

In Rome there are still some thirty basilicas, and

Romanesque Interior.

the Romanesque style may be said never to have died out there. As we recede from the centre, we find its influence gradually weaken, and succumb to the Northern Gothic style. Thus, in Lombardy

and Provence, it was superseded by the Lombard (q. v.) and Romance styles in the 11th and 12th centuries; while in Byzantium and the East, it gave way to the Byzantine style about the time of Justinian. Amongst the finest examples remaining are St Paul's (see BASILICA) and Sta Maria Maggiore at Rome, and at Ravenna, St Apollinare; the interior decoration of which last (see fig.) is very beautiful. The mosaics of the apse, the painted walls, and the inlaid pavements of the Romanesque churches, are amongst their finest features. In colour, they always excel.

In Tuscany, there is a late form of Romanesque, of which the cathedrals at Pisa and Lucca, San Miniato at Florence, and many churches in those cities, are examples. They are intermediate specimens, built during the 11th c., when the cities became prosperous, and have a certain amount of Gothic feeling; but although beautiful in coloured decoration, they have not the simple grandeur of the early basilicas; and although more decorated externally than these, they have not the bold and purpose-like appearance of Gothic elevations.

ROMANIC LANGUAGES, a general name for those modern languages that are the immediate descendants of the language of ancient Rome. In those parts of the empire in which the Roman dominion and civil institutions had been most completely established, the native languages were speedily and completely supplanted by that of the conquerors—the Latin. This was the case in Italy itself, in the Spanish peninsula, in Gaul or France, including parts of Switzerland, and in Dacia (see WALACHIAN LANGUAGE). When the Roman empire was broken up by the irruptions of the northern nations (in the 5th and 6th centuries), the intruding tribes stood to the Romanised inhabitants in the relation of a ruling caste to a subject population. The dominant Germans continued for several centuries to use their native tongue among themselves; but from the first they seem to have acknowledged the supremacy of the Latin for civil and ecclesiastical purposes, and at last the language of the rulers was merged in that of their subjects; not, however, without leaving decided traces of the struggle—traces chiefly visible in the intrusion of numerous German words, and in the mutilation of the grammatical forms or inflections of the ancient Latin, and the substitution thereof of prepositions and auxiliary verbs. It is also to be borne in mind that the language which underwent this change was not the classical Latin of literature, but a popular Roman language (*Lingua Romana rustica*) which had been used by the side of the classical, and differed from it—not to the extent of being radically and grammatically another tongue, as some writers unwarrantably conclude—but chiefly by slovenly pronunciation, the neglect or misuse of grammatical forms, and the use of 'low' and unusual words and idioms. As distinguished from the old *lingua Latina*, the language of the church, the school, and the law, this newly-formed language of ordinary intercourse, in its various dialects, was known as the *Lingua Romana*; and from this name, probably through the adverb *Romaniōs*, came the term Romance (Prov. and O. Fr. *romans*, Sp. *romance*, It. *romanzo*), applied both to the language and to the popular poetry written in it, more especially to the dialect and productions of the troubadours in the south of France.

According to the theory of Raynouard (q. v.), the new language that sprang out of the corruption of the Latin was at first essentially the same over all the countries in which Latin had been spoken, and is preserved to us in a pure state in the Provençal or language of the troubadours; and it was from this as a common ground, and not from the original

Latin, that the several Neo-Latin tongues diverged into the different forms which they now present. This theory is not accepted by more recent inquirers: its groundlessness has been demonstrated by Sir G. Cornwall Lewis in his elaborate *Essay on the Origin and Formation of the Romance Languages* (2d ed. Lond. 1862). It is beyond doubt that the several daughters of the mother Latin had their characteristic differences from the very first, as, indeed, was inevitable. The original Latin spoken in the several provinces of the Roman empire must have had very different degrees of purity, and the corruptions in one region must have differed from those in another according to the nature of the superseded tongues. To these differences in the fundamental Latin must be added those of the superadded German element, consisting chiefly in the variety of dialects spoken by the invading nations and the different proportions of the conquering population to the conquered. French, e.g., as was to be expected, is richer in German words than any other member of the family, having 450 not found in the others. Italian is next to French in this respect. There are about 900 in the Romanic languages altogether, of which about 300 are common to them all. A great many of these words are terms relating to warfare.

The varieties of speech originating in the way now described (which first received the general name of Romanic* languages in recent times from German scholars—*Romanische Sprachen*) are divided by Diez into six jurisdictions:

1. The Italian, preserving, as was to be expected, the traits of the mother Latin in more recognisable form than any of the sister tongues. It presents a variety of strongly marked dialects.

2. The Walachian (see WALACHIAN LANGUAGE).

3. The Spanish, which is characterised by copiousness and etymological obscurity, arising from the establishment of so many different nations on the soil. For one element of difference, it contains a large number of Arabic words—as many as 500 terms have been enumerated. Of the various dialects, the Castilian is considered the standard.

4. The Portuguese, including both the language of Portugal and of Galicia; it is nearly akin to the Spanish, but differs too much in some points of grammar to be reckoned a mere dialect.

5. Provençal, the language of the south of France, extending on the one side into Spain over Catalonia, Valencia, and the Balearic Isles; and on the other over Savoy and part of Switzerland, about the Lake of Geneva. The line of division between the Provençal and the northern idiom which has now become the literary language of the whole of France, is usually drawn through Dauphiné, Lyonnais, Auvergne, Limousin, Perigord, and Saintonge. From the use of the affirmative *oc* (= yes), the Provençal was known as the *Langue d'oc*, as the northern French was called the *Langue d'oïl*, from *oil*, modern French *oui* (see *LANGUEDOC*).† The Provençal was at an early period a cultivated language, with a regular system of grammar, and in the 12th and 13th

centuries, produced a rich poetical literature (see TROUBADOURS).

6. French, extending over the northern half of France, and parts of Belgium and Switzerland. Diez conceives that at first northern French may have been little different from Provençal, but, beginning with the 9th c., it has been more and more distinguished by the greater wearing away of the original grammatical forms. See *FRENCH LANGUAGE AND LITERATURE*.

The language of the canton of the Grisons (q. v.), anciently *Rhetia*, though sufficiently distinct from Italian and French, is not considered by Diez to have attained sufficient fixity or independence to deserve being ranked along with the others as a seventh Romanic tongue. It is called by the Germans *Cur-wälsch*, by the people themselves *Rumonsch*. There are two chief dialects, the Oberland, about the sources of the Rhine, and that spoken in the Engadine (q. v.), called the Ladin.

The chief authorities on this subject are the two great works of Diez (q. v.), the *Grammar* and the *Dictionary* of the Romanic Languages. The *Dictionary* and the *Introduction* to the *Grammar* have been translated into English.

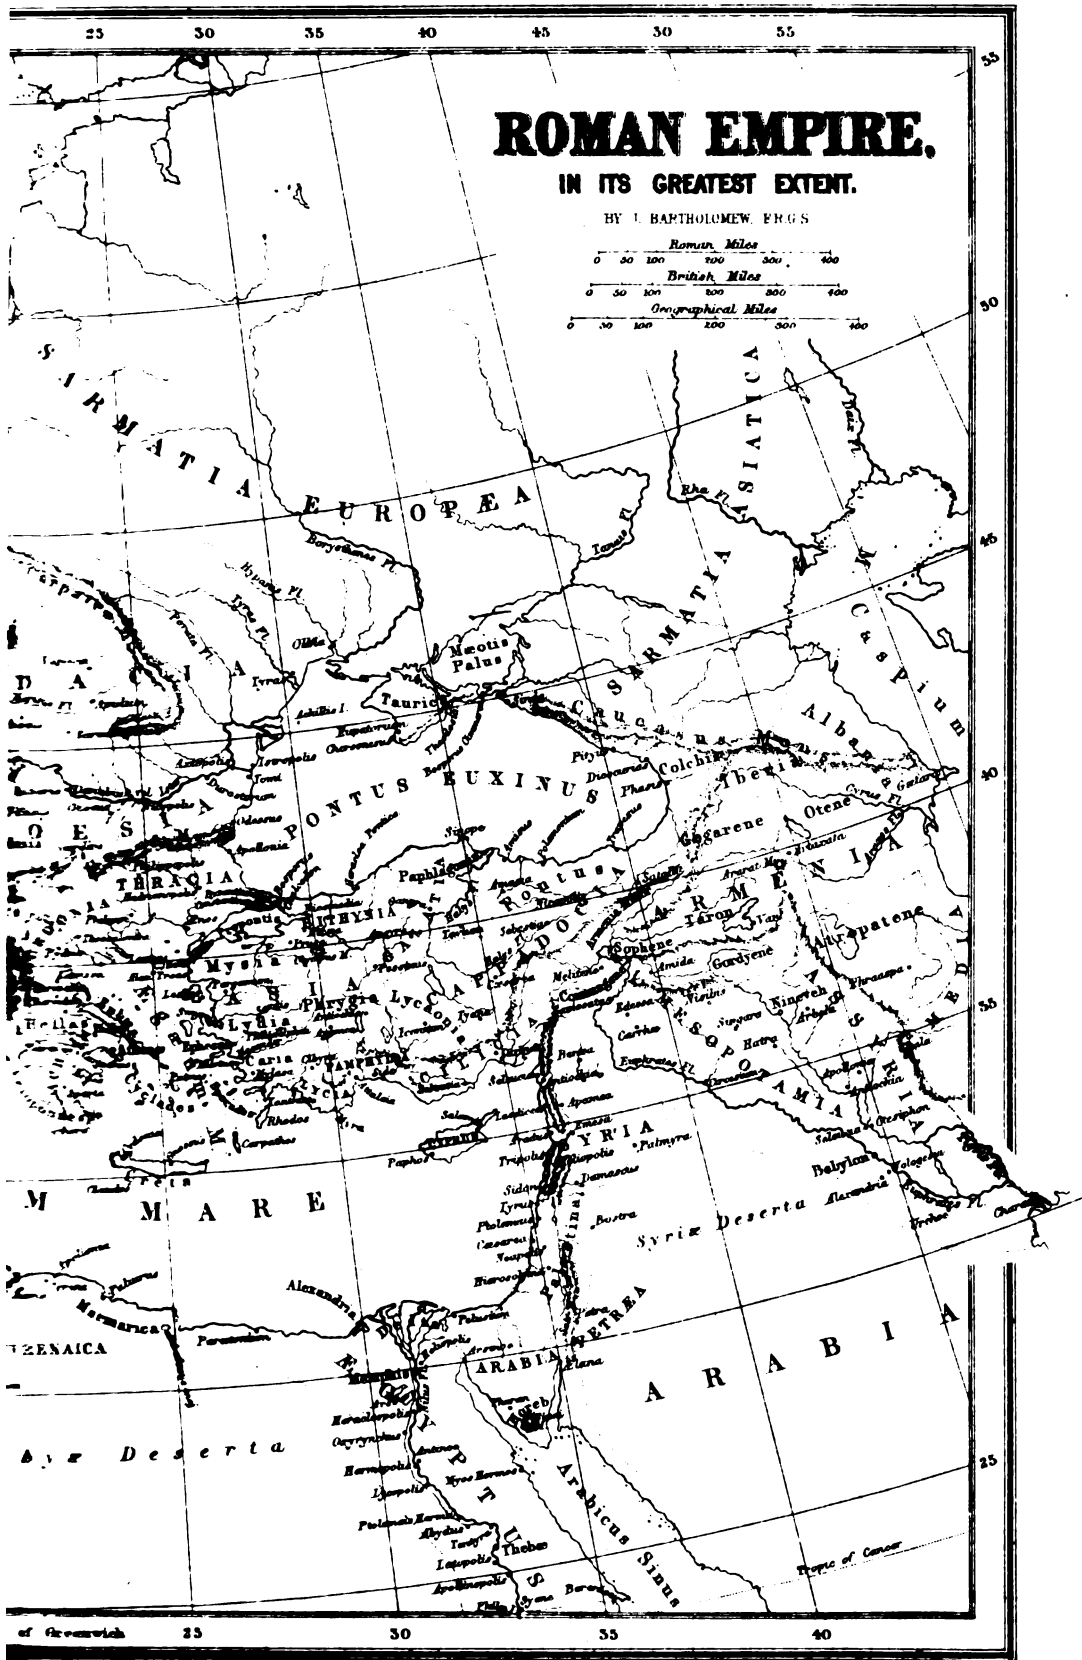

ROMANOFF, THE HOUSE OF, of which the present imperial family of Russia is the chief representative, is said to have derived its origin from a Lithuanian prince of the 4th c.; but however this may be, it is certain that the family did not make its appearance in Russia till the 14th c., when Andrew Kobyla emigrated from Prussia to Moscow in 1341, and entered the service of the then grand-duke, Simeon the Pious. Andrew's descendants became bojars early in the 15th c., their territories lying in the government of Vladimir, and district of Jurief-Polskoi. The bojar *Roman Jurievitch*, the fifth in direct descent from Andrew, died in 1543, leaving a son and daughter; the latter of whom became czarina by her marriage with Ivan the Terrible; while the former, *Nikita Romanovich Jurief*, by his nuptials with the Princess of Susdal (a direct descendant from a brother of St Alexander Nevskoi), was also allied to the royal race of Rurik. Nikita was one of the regency during the minority of Feodor I.; and his eldest son Feodor, under the name of *Philarete*, was elevated to the rank of archimandrite and metropolitan of Rostof during the reign of the false Dmitri. The Romanoffs supported that party who tendered the Russian crown to the Polish prince, and Philarete had gone with that view to Poland, when a sudden outburst of national sentiment put a stop to these negotiations, and the unlucky envoy was in consequence thrown into prison by the enraged Poles. The national party now proceeded to the election of a native sovereign, who should be as closely allied as possible by blood to the race of Rurik; and after much hesitation and many rejections, they chose MIKAIL FEODOROVITCH ROMANOFF, the son of the imprisoned metropolitan, and the representative, through his grandmother, of the royal house of Rurik, 21st February 1613. This selection, which had been made by the higher nobility and the clergy, was rapturously applauded by the people; and though the new czar was not quite seventeen years of age, the general desire of all classes to conform to his ordinances rendered the cares of government comparatively light. He was succeeded by his eldest son, *Alexei Mikailovich* (1648—1676), an able prince, who carried on war with varied success against the Swedes and Poles, and acquired a great reputation as a legislator. Alexei was twice married, and left by his first wife two sons, Feodor and Ivan, and many daughters, and by his second wife, one son, Peter. His eldest son, *Feodor* (1676—1682), was a

* *Romanic* seems preferable to *Romance*, the term employed by many English writers, both as being more in analogy with *Italic*, *Arabic*, &c., and as avoiding the association with a particular kind of literature, and the special Neo-Latin tongue in which that literature was originally written—viz., the Provençal.

† Instead of the etymologies of *oc* and *oil* given in the article referred to, Diez derives *oc* from *Lat. hoc*, &c. (equivalent to Eng. *so*, Ital. and Fr. *si*, which are only other forms of the Pronoun [q. v.] *sa* or *ta*); in the north, *oc* was first shortened into *o*, and then compounded with *il* (*Lat. hoc illud*).

Poesie (Leip. 1847); H. Heine's *Zur Geschichte der neuen schönen Literatur in Deutschland* (Hamb. 1833); and Hettner's *Die Romantische Schule in ihrem innern Zusammenhang mit Goethe und Schiller* (Bruna 1850).—Between twenty and thirty years later, a similar school arose in France, and had a long struggle for supremacy with the older Classic School. It was victorious, but not wise, and, except in a few instances—such as Lamartine and Victor Hugo—it has rushed into excesses of caprice both literary and moral, which have stamped it with a revolutionary rather than a reformatory character.—See Huber's *Die Romantische Poesie in Frankreich* (1832); Michiel's *Histoire des Idées Littéraires* (2 vols., Par. 1841); and Tenint's *Prosodie de l'École Moderne* (Par. 1844.)

ROME. The design of this article is to furnish the reader with a brief outline of the ETHNOLOGY and HISTORY of ancient Italy, in so far as these are not already discussed or described under particular heads, to which reference will be made. As the Roman state gradually conquered and incorporated with itself the other states and territories of the Italian peninsula, and as these (in general) figure separately in history only during the process of this subjugation, it will be most convenient to consider them here.

Ethnology.—In the earliest times we find in Italy four distinct races; three of which (LAPYGIANS, ETRUSCANS, and ITALIANS) may, in a restricted sense, be termed 'native,' inasmuch as we do not meet with them elsewhere; and two, GREEKS and GAULS, 'foreign,' inasmuch as their chief settlements were not in Italy, but in Greece and Gallia. But, ethnologically, this distinction is arbitrary. There is no reason for believing that the first three races were indigenous, and the last two, immigrant; the analysis of their languages, or of such fragments of their languages as survive, leads strongly to the conclusion that all were alike immigrant, and that in this respect the only difference between them is one of time.—1. *The Iapygians.*—This race, monuments of which in a peculiar language (as yet undeciphered), have been found in the south-east corner of Italy—the Messapian or Calabrian peninsula—is in all probability the oldest.—2. *Etruscans.*—The origin of this mysterious people is certainly one of the most interesting, if also one of the most insoluble problems in history. It is not, however, necessary to say anything about them here, as their history, character, and civilisation are handled at length in the article ETRURIA.—3. *Italians.*—At what period the earliest immigrations into Italy of the so-called 'Italian' races—the Latins and Umbro-Sabellians, took place, it is wholly impossible to tell; but it was undoubtedly long before the Etruscans had settled in Etruria. They were by far the most important of the various races that inhabited the peninsula; in fact, the entire historical significance of Italy depends upon them; and therefore it is fortunate that their ethnological origin and affinities are capable of the most certain demonstration. An investigation of their language, subdivided indeed into numerous dialects, often widely differing but fundamentally the same, has resulted in the discovery that they belong to the great Aryan or Indo-Germanic family (see ARYAN RACE and ARYAN LANGUAGES), and are in particular closely allied to the Hellenes. We are therefore warranted in affirming that at some very remote period a race migrated from the East, embracing the ancestors of both Greeks and Italians. By what route they proceeded, or at what point they diverged, we can only conjecture, for the problem is not yet solved whether the Hellenes reached Greece by way of Asia Minor or

from the regions of the Danube; but, at any rate, Mommsen's statement that 'the Italians, like the Indians, immigrated into their peninsula from the north,' may be regarded as certain. There is ground for believing that the Latins were the first members of the Italian family to enter Italy, and that having crossed the Apennines, they spread themselves to the south along the western coast, driving the Iapygians before them, and finally cooping them up in the Calabrian peninsula—the heel of the boot. But this conquest belongs to prehistoric ages, and the original Latins of Campania, Lucania, Bruttium,* perhaps even Sicily (i. e., the races spoken of in classic legend, as the Itali, from whom the peninsula received its name, the Margetes, Ausones, Siculi, &c.), were themselves in the course of time so thoroughly Hellenised by the influence of the rich and powerful Greek colonies planted on their coasts (see MAGNA GRÆCIA), or so overwhelmed by the successive invasions of Samnite hordes, that nearly every trace of a primitive Latin nationality has disappeared, and only here and there a solitary linguistic or legendary relic survives to indicate faintly the path which conjecture should pursue. It was only in Latium Proper, where no Greek colonies were founded, and where the fortune of war was in its favour, that the Latin branch of the Italian race firmly rooted itself. There, however, it did flourish, and petty as the district might seem—not more in all than 700 square miles—it was incomparably the most important in the peninsula, for within its limits rose those seven hills on which a city was to be built that was destined to subdue and govern the world. The other branch of the 'Italian' stock—the Umbro-Sabellian, must have entered Italy at a later period than the Latin. Its advance along the central mountain-ridge—the Apennines—from north to south can still be traced; and its last phases—i. e., the conquest of Campania and the other southern districts of the peninsula by the Samnite highlanders—belong to purely historical times. The oldest members of this branch are probably the Sabines (q. v.), who seem to have fixed themselves in the mountainous region to the north-east of Rome, and are regarded as the progenitors of that multitude of tribes which we find occupying the central portion of Italy—the Picentes, Peligni, Marsi, Æqui, Vestini, Marrucini, Frentani, Samnites—perhaps also the Volsci and Hernici.—4. *Gauls.*—To a period considerably later and comparatively historical, belong the settlement of the Gauls in the north, and of the Greeks in the south of Italy. The former, a branch of the Celtic race, itself now ascertained to be also a member of the great Aryan family (see CELTIC NATIONS), and therefore allied, however distantly, to the other Italian races, had for ages before history begins fixed themselves in the region now known as France. Finding further progress westward barred by the waves of the Atlantic, and being of a restless and excitable disposition, they turned their steps east and south-east, broke over the Alps (according to the legend in Livy, by the Little St Bernard) some time during the 3d c. after the founding of Rome, and poured down into the plains of the Po. The first Gallic tribe that made its appearance on the soil of the peninsula is said to have been the Insubres, whose capital was Mediolanum (Milan); then followed the Cenomani, whose headquarters were Brixia (Brescia) and Verona, and afterwards numerous kindred hordes, among the latest and most powerful of whom were the Boii (q. v.) and Senones, who forced their

* The name 'Bruttium' given to the country of the Bruttii by modern writers on classical geography, is not found in any ancient author.

way across the Po, and effected a lodgment in the modern Romagna, occupying (besides an inland district) the coast of the Adriatic as far south as Ancona. Hence, in ancient times, the whole of Northern Italy was for a long period known as Gallia Cisalpina (Gaul on *this*, i.e., the Italian side of the Alps), to distinguish it from Gaul Proper, which was called Gallia Transalpina. Gallia Cisalpina was again subdivided into two parts by the river Padus (Po); the northern being named Gallia Transpadana, and the southern (the country of the Boii and the Senones), Gallia Cispadana. Various other tribes or peoples are found in the north of Italy, such as the Ligurians (along the Gulf of Genoa) and the Veneti (in modern Venetia), regarding whose origin—in the absence of all linguistic and other memorials—we are utterly in the dark.

5. *Greeks*.—The other people which we have distinguished as 'foreign,' was the Greek. There is, however, this distinction to be observed, that the Greeks were not (like the Gauls) barbarians; they did not swoop down upon the southern shores of Italy (like the Norse pirates on the coasts of England and France) to plunder and devastate; nor did they force their way into the interior and dispossess the native inhabitants; they merely colonised the coasts, built cities, and carried on commerce. Through them it is probable the Romans acquired their earliest notions of the Greek literature, philosophy, and cultus. For further information concerning them, we refer the reader to the article MAGNA GRÆCIA, and to such of their cities as have received separate treatment.

Primitive Social Condition of the Latins.—With this brief introductory sketch of the various races that inhabited Italy in historical or pre-historical times, we may now revert to the Latins, with whom we have at present more particularly to do. What was the extent of their civilisation, or how far their social organisation had proceeded when they finally settled in the 'broad plain' (*Lătium*, connected probably with *lătus*, broad; *lătus*, a side; Gr. *platus*; Eng. *flat*) that stretches westward from the Alban Hills to the sea, may be conjectured, but cannot be positively ascertained. We know, indeed, that long before they had set foot in Italy, before even they had branched off from their Hellenic brethren, they had ceased to be mere nomades, or wandering shepherds. The evidence of this fact lies in their language. Not only do the names of the oldest Latin nations, as the *scuti*, ('the sickle-bearers' or 'reapers'), and the *osci*, or *opesi* ('field-labourers'), clearly prove the antiquity of Italian husbandry; but the oldest agricultural terms are actually common to both Latins and Greeks (e.g., Lat. *ager*, Gr. *agros*; Lat. *aro*, *aratrum*, Gr. *aroō*, *arotron*; Lat. *ligo* (a hoe), Gr. *lachaino*; Lat. *hortus*, Gr. *choros*; Lat. *milium*, Gr. *melinē*; Lat. *rapa*, Gr. *raphanis*; Lat. *malva*, Gr. *malachē*; Lat. *vinum*, Gr. *oinos*). Moreover, the form of the plough was the same among both peoples, as also their mode of cutting and preparing the grain; many of the usages of social life; the oldest methods of measuring the land; and the style of their national dress—the Latin *tunica*, corresponding exactly with the Greek *chiton*, while the Latin *toga* is only a fuller *himation*. Their method of building was also the same. Such evidence (and it could easily be extended) must be regarded as conclusively shewing that before the Latino-Italians entered Italy, they had been accustomed to till the ground, to make wine, to keep gardens, to build houses, and to decently clothe themselves. As to their social organisation, less can be said. It appears, however—judging from the general bearing of the most ancient traditions, as also from the features exhibited in historical times—that at a very

early period, and from causes of which we are now absolutely ignorant, they had begun to develop the germs of what may be called 'state-life.' As among their Hellenic brethren, the original foundation of their social constitution was 'households' (*oikiai*, Lat. *vici* or *pagi*, from *pagere*, to 'fix' or 'drive in'; hence 'to build'): these, either by ties of blood, or by nearness of locality, were aggregated into clans, and their dwellings formed clan-villages (thus *pagus*, which probably meant at first only a single 'household,' came, by a natural transition, to denote a collection of households—a hamlet, or a village). Such clan-villages were, however, not regarded as independent societies, but as parts of a political canton or community—the *civitas* or *popeulus*. Each canton or *civitas* possessed a local centre or place of assembly, where justice was administered at regular intervals, where markets and sports were held, and religious rites celebrated, and which was besides fortified to serve as an asylum or place of refuge for the inhabitants of the open hamlets and their cattle in time of war. Such a centre was termed the *capitolium*, i.e., 'the height,' from being originally fixed on a height or hill-top, and corresponded to the *akra* of the Greeks. Round the stronghold of the canton, which formed the nucleus or beginning of the earliest Latin towns, houses gradually sprung up, which in their turn were surrounded by the *oppidum* ('work,' from *opus*), or the *urbs* ('ring-wall,' connected with *urvus*, *curvus*, *orbis*); hence, in later times, *oppidum* and *urbs* became, naturally enough, the recognised designations of town and city. Evidence is not wanting to justify this view of the genesis of the Latin towns. In the ruder and more mountainous districts of Central Italy, occupied by the Marsi, Equicoli, &c., the system of living only in open villages prevailed down even to the close of the Empire, and there the Roman antiquarians found, to their inexplicable surprise, those solitary strongholds with their mysterious ring-walls, which, on the soil of Latium Proper, expanded into towns, but in the recesses of the Apennines never advanced beyond their original design.

The sites of the oldest of these cantonal-centres or primitive towns in Latium are to be sought for on the slopes of the Alban hills, where the springs are freshest, the air most wholesome, and the position most secure. Tradition (which makes Alba Longa the oldest seat of a Latin community) is here in accordance with natural probability.* On the same slopes lay Lanuvium, Aricia, and Tusculum, to the great antiquity of which ancient tradition bears testimony in many ways; on the offshoots of the Sabine range, in the east of Latium, stood Tibur and Praeneste; in the plain between the Sabine and Alban ranges, Gabii, Labici, and Nomentum; on or near the coast, Laurentum and Lavinium; and on the isolated hills overlooking the Tiber (the boundary between Latium and Etruria), the frontier town of Rome. How many cantons were originally in Latium, it is neither possible nor important to know. Tradition mentions 30 sovereign or politically independent communities (with Alba Longa at their head), which formed the famous Latin league. The historical order of their constitution is a point regarding which we are equally ignorant, but there is reason to believe that the Roman canton, or at least its capital, the town of R., was among the latest.

* It is perhaps hardly necessary to remark that the story of the foundation of Alba Longa by Ascanius, the son of Æneas, and the introduction of a Tyrrhenian Trojan element into the primitive history of Latium, is an utterly worthless fable.

political organisations of the Latins. The history and fortunes of this canton we now proceed briefly to trace.

History of R. during the Earliest or Regal Period.

—According to the myth of Romulus, R. was an offshoot from Alba-Longa, and to the biography of that hero we refer the reader for an outline of the ancient legend; but the most rational view of the city's origin is that which is suggested by a consideration of its site. It probably sprang into existence as a frontier-defence against the Etruscans, and as an emporium for the river-traffic of the country; but whether it was founded by a common resolve of the Latin confederacy, or by the enterprise of an individual chief, is beyond the reach even of conjecture. The date fixed upon for the commencement of the city, by the formation of the *Pomerium*, viz., 21st April 753 B.C., is, of course, perfectly valueless in its precision. We know and can know nothing whatever on the point. The three 'tribes,' Ramnians, Titians, and Luceres, who appear in the Romuleian legend, as the constituent parts of the primitive commonwealth, suggest the idea that R. (like Athens) arose out of a *synoikismos* or amalgamation of three separate cantons; but Mommsen rejects as 'irrational' the common opinion that these cantons represent different races, and that the Romans were a 'mongrel people,' made up of Latins, Sabines, and Etruscans, with perhaps a dash of Hellenic and imaginary 'Pelagic' blood in their veins! The existence of a Sabine element, represented by the Titians, is indeed admitted; but its introduction is thrown back to a period long anterior to the foundation of the city, when the Roman clans were still living in their open villages, and nothing of R. existed but its 'stronghold' on the Palatine. Nor is there anything to indicate that it materially affected the Latin character, language, polity, or religion of the commonwealth which was subsequently formed.

The motives which probably led to the building of R., also led to its rapid development, so that the great peculiarity of the Roman, as compared with the other Latin cantons, is the prominence which its urban life assumed in the earliest period. No doubt the Roman continued to manage his farm in the cantonal territory, but the insalubrity of the Campagna, as well as the advantages of river-traffic, and the necessity for watchfulness imposed upon all frontier towns in rude ages, must ever have acted as an inducement to him to take up his residence as much as possible in the city. The consequence was that the Roman became essentially a 'citizen,' while the other Latins remained essentially 'rustics.' So markedly is this the case, that the beginnings of Roman history—if the ancient legend may be so designated—are mainly records of its urban expansion and political growth. That the Palatine Hill was the chief portion of the city is attested by a variety of circumstances. Not only does it hold that rank in the Romuleian legend, but on it were situated the chief civil and religious institutions. The Romuleian myth of the establishment of an asylum on the Capitoline (see *CAPITOL*) for homicides and runaway slaves, with all its famous consequences—the *Rape of the Sabine Women*, the wars with the Latins of Cæcina, Antemne, and Crustumium, but especially with the Sabines of Cures under their king Titus Tatius, the tragic fate of Tarpeia, and the fine feminine valour of the ravished maidens, who had learned to love their captors, is historically worthless; except, perhaps, so far as it shews us how from the beginning the Roman burghers were engaged in constant feuds with their neighbours for the aggrandisement of their power. The entire

history of the 'regal period,' in fact, has come down to us in so mythical and legendary a form, that we cannot feel absolutely certain of the reality of a single incident. That such personages as Numa Pompilius, Tullus Hostilius, Ancus Martius, Lucius Tarquinius Priscus, Servius Tullius, and Lucius Tarquinius Superbus, ever existed, or, if they did, that the circumstances of their lives, their institutions, their conquests, their reforms, were as the ancient narrative describes them, are things which no critical scholar can believe. The destruction of the city records by the Gauls, when they captured and burned R. in the 4th c. B.C., deprived the subsequent chroniclers of authentic information in regard to the past, and forced them to rely upon treacherous reminiscences, on oral tradition, on ballads, and on all the multifarious fabrications of a patriotic fancy, that would naturally seek compensation for political disaster in the splendour with which it would invest its primeval history. The utmost reach, therefore, to which our knowledge can attain, is to form some general idea—mainly by inference from the institutions that we find existing in later times—of the course that social and political progress followed in the Roman commonwealth.

From the very beginning of the city—and probably long before—the inhabitants were divided into two orders (exclusive of 'slaves')—viz., householders and their dependents, better known perhaps as 'patricians' (from *pater*, a father) and 'clients' (i.e., 'listeners' from *cluer*, 'to listen'). The former alone possessed political—i.e., burgess-rights. It was they who exclusively constituted the *populus* ('the people'); while the clients had no political existence whatever. How this latter class originated we do not know, but 'superiors' and 'inferiors' exist everywhere, and there is really nothing wonderful in the phenomena, except the rigour of their political subjection. In a thriving community like the Roman, which seems to have always held a somewhat isolated and antagonistic position to the other Latin cantons, new-comers, such as refugees and the like, would be frequent; and these alien settlers, it is clear, never obtained (except under very special circumstances) the privileges of the original Roman families. That the clients formed a body essentially different from the *plebs*, is not true, and seems based merely on the mythical account of what followed the destruction of Alba Longa by Tullus Hostilius. The name *plebs* (i.e., 'the multitude,' from the same root as *pleo*, I fill, *plenus*, full; with which is perhaps connected the other Latin word *vulgus*, Eng. *folk*), is doubtless, as its signification indicates, of later origin than *clientes*; but both are applicable to the same persons, who were called 'listeners,' in reference to their being dependents on the different burgess-households, and the 'multitude,' in reference to their want of political rights. The constitution of the state was simple. All the burgesses were politically on a footing of equality. From their own ranks was chosen the king or 'leader' (*rex*), who was therefore nothing more than an ordinary burgess—a husbandman, a trader, a warrior, set over his fellows. But it must at the same time be observed, that his authority was great, for the Roman state was based on the Roman household, and something of the absoluteness of the *patria potestas* appears in the uncircumscribed nature of the regal powers. The *rex* held his office for life; he consulted the national gods; he appointed the priests and priestesses; he called out the *populus* for war, and led the army in person; his command (*imperium*) was not to be gainsayed, on which account on all official occasions he was preceded by 'messengers' or 'summoners' (*lictors*, from *licere*, 'to summon,' though commonly

given from *ligo*, 'to bind'), bearing the 'fasces' (axes and rods tied up together), the symbols of power and punishment; he had the keys of the public chest, and he was supreme judge in all civil and criminal suits. The Roman religion or *cultus* was from the first thoroughly subordinate to the authority of the state; and all that we can infer from the myth of Numa is that R. perhaps owed its colleges of augurs and pontiff to the wisdom of some enlightened sovereign who felt himself at times embarrassed in his decisions on matters of religious and public law, and recognised how valuable might be the aid afforded him by a body of sacred experts. We may rest certain that originally the sole power was the regal, and that the subordinate magistracies found at a later time arose from a delegation of regal authority, rendered necessary by the ceaseless increase of state-business. 'All the officials of the earliest period,' says Mommsen (who has expounded this view with admirable sagacity in his chapter on the "Original Constitution of Rome"), 'the extraordinary city-warden (*praefectus urbi*, who doubtless governed in the absence of the *rex*), as well as those who were probably nominated regularly, the "trackers of foul murder" (*quaestores paricidii*), and the "leaders of division" (*tribuni*, from *tribus*, part) of the infantry (*militēs*), and of the cavalry (*celerēs*), were mere royal commissioners, and not magistrates in the subsequent sense of the term.' On the other hand, we may believe that the *senatus*, or Council of the Elders, from its very nature, was as old an institution as the monarchy itself. Among the very first things the 'citizen-king' would do, would be to choose out of the ranks of his fellow-burgesses a number of experienced men to assist him with their counsel; but it is to be observed that this body possessed no coercive or constraining powers. They gave their advice when the *rex* chose to ask it; that was all. Yet as the tenure of their office was for life, they necessarily possessed great moral authority; and it was only when the king, the senate, and the community were at one in regard to any important matter—a war, for example—that it was held to be righteous, and likely to be favoured by the gods. The burgesses, or householders, were divided into *curia*—i. e., 'wardships,' connected probably with *cura* and *curare*, 'to care for,' rather than with *curia*, and the Sabine *cures*, as Varro thinks. Ten households formed a *gens* (a 'clan' or 'family'); 10 clans, or 100 households, formed a *curia*, or wardship; and 10 wardships, or 100 clans, or 1000 households, formed the *populus*, *civitas*, or community. But as Rome was a *synoikismos* of three cantons, the actual number of wards was 30, of clans 300, and of households 3000. Every household had to furnish one foot-soldier (hence the name *miles*, the 'thousandth walker,' from *mil*, and *eo* (?) 'to go'), and every clan a horseman and a senator. Each ward was under the 'care' of a special warden (the *curio*), had a priest of its own (the *flamen curialis*), and celebrated its own festivals. None but burgesses could bear arms in defence of the state (hence their designation, *populus*, 'the warrior body,' connected with *populari*, 'to lay waste,' and *papa*, 'the priest, or priest's assistant, who felled the victim at the altar—the sacred butcher'). In the old litanies the blessing of Mars is invoked upon the *pilumnus populus* ('the spear-armed warrior-body'), and when the *rex* addressed them, it was by the name of *quirites* ('lancemen,' from *quiris*, or *curis*, a 'lance,' and *eo*, 'to go'). The original Roman army, or *legio* (i. e., 'the gathering'), was composed of three 'hundreds' (*centuriae*) of horsemen (*celerēs*—i. e., 'the swift,' or *aequantēs*, 'the wheelers'), under their divisional

leaders (*tribuni celerum*); and three 'thousands' of footmen (*militēs*), also under divisional leaders (*tribuni militum*); to whom were added a number of light-armed skirmishers (*velites*), especially 'archers' (*arquitēs*). The *rex*, as we have said, was usually the general, but as the cavalry force had a colonel of its own (*magister equitum*), it is probable that he placed himself at the head of the infantry. Military service was no doubt the prime duty of the Roman burgesses, but the king could impose upon them any labours that he reckoned necessary or advantageous to the welfare of the state, such as the erection of public edifices, the tilling of the royal demesnes, the execution of royal commissions, or the building of the city walls.

The 'foreign policy' of R. seems to have been aggressive from the first, and this character it retained as long as the aggrandisement of the state was possible. We have, it is true, no certain knowledge of the primitive struggles in which the enterprising and ambitious Roman burgesses were engaged, but it appears from the legend that at a very early period the neighbouring Latin communities of Antemnae, Crustumium, Fidenae, Medullia, Caenina, Corniculum, Cameria, Colatina were subjugated. The crisis of the Latin War, however, was undoubtedly the contest with Alba Longa, in which that 'sacred metropolis' of Latium was destroyed, and its leadership passed to the conqueror. How deadly the struggle between the two was, may be inferred from the tragic details in which the legend abounds. As a rule, on the subjugation of a canton, the conquered inhabitants were allowed to remain in their open hamlets, but their *capitolium* was razed, their weekly market, their justice-court, their gods—everything, in short, strictly national—were removed to R. while they themselves were enrolled among the clients or plebs. But sometimes the inhabitants themselves, in whole or part, were transferred to R., and individuals or clans were even received into the ranks of the Roman burgesses, as in the case of Alba Longa. Some of the famous Roman families claimed to be of Alban descent—the Julii, Serrii, Quinctilii, Cloellii, Geganii, Curiatii, and Manlii. The wars with the Etruscans of Fidenae and Veii assigned, like the destruction of Alba Longa, to the reign of Tullus Hostilius—were apparently decisive; those with the Rutuli and Volsci, however, were probably more fortunate; but uncertainty hangs like a thick mist over the ancient narrative. Even the story of the Tarquins, though it belongs to the later period of the monarchy, is in many of its details far from credible. Both Niebuhr and Mommsen consider 'Tarquin the Proud' a historical personage, and without accepting literally all the circumstances of the tradition, believe in the general outline—his character, his exacting expulsion, and his desperate efforts for the recovery of the throne—to be trustworthy. The memory of such a monarchy was likely to be preserved by the very strength of the hatred he excited, and was so daring as his expulsion (which was at the same time the death-knell of a system of government that had prevailed for ages) could hardly be a mere invention, though it might be overlapped with upon fold of picturesque fiction. The view taken by Napoleon III. (see *Histoire de Jules César*), viz. that the primitive monarchy had served its purpose, and had consequently to disappear, is perhaps so erroneous as the oracular language of the material author would lead us to suppose. The aristocracy or *populus* had become so much more powerful than the individual *rex*, that they were no longer *possess de jure* as well as *de facto* the supreme authority. The pride and tyranny of a Tar-

may very well have aided in furthering their design.

Meanwhile a great internal change had taken place in Rome. This is usually designated the Servian 'Reform of the Constitution,' although the expression is calculated to mislead. There was nothing directly political in the 'reform.' It was only a reform in the *burgess-levy*—i. e., in the mode of raising the army. Formerly, as we have seen, none but *burgesses* could bear arms in defence of the state; but the increase of the general population, caused partly by the annexation of the conquered Latin communities, and partly by time, had totally altered the relation in which the non-burgesses, or *plebs*, originally stood to their political superiors. The *plebs* could, of course, acquire property and wealth, and could bequeath it just as legally as the *populus*; moreover, such of the Latin settlers as were wealthy and distinguished in their own communities, did not cease to be so when they were amalgamated with the Roman 'multitude.' It was therefore felt to be no longer judicious to let the military burdens fall exclusively upon the old *burgesses*, while the rights of property were equally shared by the non-burgesses. Hence the new arrangement, known in Roman history as the formation of the *Comitia Centuriata*. When or with whom the change originated, it is impossible to say. The legend assigns it to Servius Tullius, predecessor of Tarquin the Proud; and it was in all probability the work of some kingly ruler who saw the necessity of reorganising the national forces. That it cannot be regarded as a change brought about by party-zeal, is obvious when we reflect that it conferred no rights, but only imposed duties on the *plebeians*. Its details were briefly as follows: Every Roman freeholder from the age of 17 to 60, whether patrician or plebeian, was made liable to serve in the army; but he took his place according to the amount of his property. The freeholders were distributed into five *classes* (i. e., 'summonings,' from *calare*, to 'summon' or 'call out'), and these *classes*, all of whom were infantry, were again subdivided into *centuriae* ('hundreds'). The first class, which required to possess property valued at 100,000 *ases*, or an entire hide of land, furnished 82 'hundreds'; the second, property valued at 75,000 *ases*, or $\frac{3}{4}$ ths of a hide of land, furnished 20 'hundreds'; the third, property valued at 60,000 *ases*, or $\frac{2}{3}$ hide of land, furnished 20 'hundreds'; the fourth, property valued at 25,000 *ases*, or $\frac{1}{4}$ th hide of land, furnished 20 'hundreds'; and the fifth, property valued at 12,500 *ases*, or $\frac{1}{8}$ th hide of land, furnished 32 'hundreds.' A single 'hundred' was, moreover, added from the ranks of the non-freeholders, or *proletarii* (mere 'children-begetters'), although it is possible that from the same order came the two 'hundreds' of 'horn-blowers' (*cornicines*), and 'trumpeters' (*tibicines*), attached to the fifth class. Thus the infantry 'hundreds' amounted to 175, that is, 17,500 men, besides whom were 18 'hundreds' of *equites* ('horsemen') chosen from the wealthiest *burgesses* and non-burgesses; so that the Roman army now numbered in all nearly 20,000 men. We have stated that the original design of this new arrangement was merely military, but it is easy to see that it would soon produce political results. Duties and rights are correlative. The former suggest the latter, and create a desire for their attainment. Hence the Servian military reform paved the way for the grand political struggle between the patricians and the plebeians, which commenced with the first year of the Republic, and only terminated with its dissolution.

The Roman Republic from its Institution to the

Abolition of the Decemvirate.—1. Internal History.—

According to the legend, the expulsion of the Tarquins was mainly the work of their cousins, Junius Brutus and Tarquinius Collatinus, in revenge for the outrage on the honour of Lucretia, and was followed by the abolition of the monarchy. The date usually assigned to this event is 509 B.C. The story is intensely tragical, and if we must consider it poetry rather than fact, yet it may safely be taken as evidence that it was an unbridled lust of power and self-gratification that brought ruin on the Romano-Tuscan dynasty. Of course, we can make nothing definite out of the early years of the republic. Dates and names, and even events, must go for very little. Valerius Publicola or Poplicola, Sp. Lucretius, M. Horatius, Lars Porcenna (q. v.) of Clusium, Aulus Postumius, with the glorious stories of Horatius Coclès and the battle of Lake Regillus, will not bear to be scrutinised. We must content ourselves with the knowledge of historical tendencies and general results. The change from 'kings' to 'consuls' (*consules*, 'those who leap together'—more generally, those who *act* together) was not intended to diminish the administrative power of the supreme rulers, but only to deprive them of the opportunity of doing harm—of becoming Tarquins; and this it effectually succeeded in doing, by limiting their tenure of office to a year, and by numerous other restrictions. (For an account of their original functions, and of the subsequent modifications which these underwent, see *CONSUL*.) It is believed to have been about this time, and in consequence of the new political changes, that the old assessors of the king, such as the *quaestores parricidii*, formally became standing magistrates instead of mere honorary counsellors, and also that the priesthood became a more self-governing and exclusive body. During the regal period the priests were appointed by the king, but now the colleges of augurs and pontiffs began to fill up the vacancies in their ranks themselves, while the vestals and separate 'flamens' were nominated by the pontifical college, which chose a president (*pontifex maximus*) for the purpose. The lapse of years ever increasing the quantity of sacred lore, also increased its importance, and the importance of those who specially studied it; and nothing comes out more clearly in the early history of the republic than the fact, that the opinions of the augurs and pontiffs became more and more legally binding. This is to be connected with the fact, that in every possible way the patricians or old *burgesses*—now rapidly becoming a mere *noblesse*—were seeking to rise on the ruins of the monarchy, and to preserve separate institutions for the benefit of their own order, when they could with difficulty longer exclude the *plebs* from participation in common civic privileges. In the details given us of the 'Servian Reform,' we can easily discern a spirit of compromise, the concessions made to the plebeians in the constitution and powers of the *Comitia Centuriata* being partially counterbalanced by the new powers conferred on the old *burgess* body, the *Comitia Curiata*—viz., the right of confirming or rejecting the measures passed in the Lower Assembly. Towards the new assembly, therefore, it stood somewhat in the relation in which the House of Lords stands to the House of Commons, but the analogy must not be pushed too far; it is only general. The character of the senate altered under the action of the same influences. Although it never had been formally a patrician body—although admission to it under the kings was obtainable simply by the exercise of the royal prerogative, yet, practically, 299 out of the 300 senators had always been patricians; but after the institution of the republic, we are told

that the blanks in the senate were filled up *en masse* from the ranks of the plebeians, so that of the 300 members less than half were *patres* ('full burgesses'), while 164 were *conscripti* ('added to the roll'), hence the official designation of the senators *patres et conscripti* ('full burgesses and enrolled').

As yet, however, it is to be observed the plebeians were rigorously excluded from the magistracies. They could vote—i. e., they could exercise legislative powers—but they had no share in the administration. None but patricians were eligible for the consulship, for the office of *questor*, or for any other executive function, while the priestly colleges rigidly closed their doors against the new burgesses. The struggle, therefore, between the two orders went on with ever-increasing violence. One point comes out very clearly from the narrative, however dubious we may be of the particular details, viz., that the establishment of the republic and the reconstitution of the burgess body, instead of allaying discontent, only fostered it. Power virtually passed into the hands of the capitalists, and though some of these were plebeians, yet they would seem to have preferred their personal money-interests to the interests of their order, and to have co-operated with the patricians. The abuse by these capitalists of the *Ager Publicus*—that is, such portion of the land of a conquered people as had been taken from them, annexed to the Roman state, and let out originally to the patricians at a fixed rent (see AGRARIAN LAW), together with the frightful severity of the law of debtor and creditor, the effect of which was all but to ruin the small plebeian 'farmers,' who constituted, perhaps, the most numerous section of the burgesses—finally led to a great revolt of the plebs, known as the 'Secession to the Sacred Hill,' the date assigned to which is 494 B.C. On that occasion the plebeian farmer-soldiers, who had just returned from a campaign against the Volscians, marched in military order out of Rome, under their plebeian officers, to a mount near the confluence of the Anio with the Tiber, and threatened to found there a new city, if the patricians did not grant them magistrates from their own order; the result was, the institution of the famous plebeian tribune (see TRIBUNE)—a sort of rival power to the patrician *consulate*, by means of which the plebeians, at least, hoped to be shielded from the high-handed oppressions of the wealthy. To the same period belongs the institution of the *ÆDILES* (q. v.). A little later, the *Comitia Tributa* emerged into political prominence. This was really the same body of burgesses as formed the *Comitia Centuriata*, but with the important difference, that the number of votes was not in proportion to a property classification. The poor plebeian was on a footing of equality with the rich patrician; each gave his vote, and nothing more. Hence the *Comitia Tributa* virtually became a plebeian assembly, and when the *plebiscita* ('Resolutions of the plebs' carried at these *comitia*) acquired (as they did by the Valerian Laws passed after the abolition of the Decemvirate) a legally binding character, the victory of the 'multitude' in the sphere of legislation was complete. From this time the term *populus* practically, though not formally, loses its exclusive significance; and when we speak of the Roman citizens, we mean indifferently patricians and plebeians. The semi-historical traditions of this period—for we are now (5th c. B. C.) beginning to emerge out of the mythical era—unmistakably shew that the institution of the tribunate led to something very like a civil war between the two orders. Such is the real significance of the legends of Caius Marcus, surnamed *Coriolanus* (q. v.); the

surprise of the Capitol by the Sabine marauder, Appius Herdonius, at the head of a motley force of political outlaws, refugees, and slaves; the migrations of numerous Roman burgesses with their families to more peaceful communities; the street-fights; the assassinations of plebeian magistrates; the annihilation by the Etruscans of the Fabian gens, who had left R. to escape the vengeance of their order for having passed over to the side of the plebeians; and the atrocious judicial murder of Spurius Cassius, an eminent patrician, who had also incurred the deadly hatred of his order, by proposing an agrarian law that would have checked the pernicious prosperity of the capitalists and overgrown landholders. Finally, 462 B.C., a measure was brought forward by the tribune C. Terentilius Urso, to appoint a commission of ten men to draw up a code of laws for the purpose of protecting the plebeians against the arbitrary decisions of the patrician magistrates. A fierce, even a frantic, opposition was offered by the patricians, and ten years that followed were literally a period of organised anarchy in Rome. At length the nobles gave way, and the result was the drawing up of the famous code known as the *Twelve Tables*—at first *Ten*, to which two were afterwards added—the appointment of the DECEMVIRI (q. v.), and the abolition of all the ordinary magistrates, both patrician and plebeian. The government by decemvirs, however, lasted only two years; according to tradition, the occasion of its overthrow was the attempt of the principal decemvir, Appius Claudius (q. v.) to possess himself by violence of the beautiful daughter of Virginus, a Roman centurion; but the real cause was doubtless political, though the greed of a Claudius may have afforded the occasion. The result of which was the restoration of the pre-decemviral state of things—the patrician *consulate* and the plebeian tribunate.

2. *External History*.—The external history of R., from the establishment of the republic to the abolition of the decemvirate, is, it may hardly be said, purely military. The Romans fought incessantly with their neighbours. Long before the close of the regal period they had acquired, as we have seen, the leadership of Latium, and in all the early wars of the republic they were assisted by their allies and kinsmen, sometimes also by other nations—as, for example, the Hernicans, between whom and the Romans the Latins a league was formed by Spurius Cassius at the beginning of the 5th c. B.C. The most important of these wars were those with the southern Etruscans, especially the Veientes, in which, however, the Romans made no way, and even suffered terrible disasters, of which the legend concerning the destruction of the Fabian gens on the Crustumine (477 B.C.) may be taken as a distorted representation; the contemporaneous wars with the Volscians in which Coriolanus is the most distinguished hero, and those with the Æqui (458 B.C.), to which belongs the fine legend of Cincinnatus (q. v.).

From the Abolition of the Decemvirate to the Defeat of the Samnites, and the Subjugation of all the 'Italians' (449–265).—1. *Internal History*.—The leading political features of this period are the equilibrium of the two orders, and the growth of the new aristocracy of capitalists. After the abolition of the decemvirate, it would seem—judging from the course of events—that the whole of the plebeian aristocracy, senators and capitalists (from motives of selfish aggrandisement), combined with the masses of their order to make a series of grand attacks on the privileges of the old Roman nobles. The struggle lasted for 100 years; and ended, as it could only end, by the removal of all the social and

political disabilities under which the plebeians had laboured—though the stratagems and artifices to which the old aristocracy had recourse, proved the reluctance with which they succumbed to fate. First in 445 B.C., only four years after the fall of the decemvirs was carried, the *Lex Canuleia*, by which it was enacted that marriage between a patrician and plebeian should be legally valid. At the same time, a compromise was effected with respect to the consulship. Instead of two patrician consuls, it was agreed that the supreme power should be entrusted to new officers termed 'Military Tribunes with Consular Power,' who might be chosen equally from the patricians or plebeians. Ten years later (435 B.C.), the patricians tried to render the new office of less consequence by the transference of several of the functions hitherto exercised by consuls to two special patrician officers named *Censores* (q. v.). The 'censorship,' Mommsen remarks, 'gradually became the palladium of the aristocratic party, less on account of its financial influence, than for the sake of the right annexed to it of filling up vacancies in the senate and in the equites.' In 421 B.C., the quaestorship (see *QUAESTOR*) was thrown open to the plebeians; in 368 B.C., the mastership of the horse; in 356 B.C., the dictatorship (see *DIKTATOR*); in 351 B.C., the censorship; in 337 B.C., the praetorship (see *PRÆTOR*); and in 300 B.C., the pontifical and augural colleges. These victories were not all won without the shedding of blood. How great was the exasperation of the patricians may be estimated from the story of Spurius Maelius, the rich plebeian, who was murdered simply because in a season of famine he sold corn at a very low price to the poor.

The only effect, it is to be observed, of these political changes was to increase the power of the rich plebeians; and consequently, the social distress continued to shew itself as before. No genuine national concord was possible so long as *that* remained unmitigated. Efforts were repeatedly made by individuals to remedy the evil, but without success. Such were the attempts of the tribunes Spurius Maelius and Spurius Metilius (417 B.C.) to revive the agrarian law of Spurius Cassius; and of the noble and patriotic patrician, Marcus Manlius, who, though he had saved the Capitol during the terrible Gallic siege, was hurled from the Tarpeian Rock (384 B.C.), on the customary charge, as groundless in his case as it was base, of aspiring to the monarchy; but at length (367 B.C.), after a furious struggle of eleven years, the famous Licinian Rogations (see *AGRARIAN LAW*) were carried, by means of which it was hoped that an end had been put to the disastrous dissensions of the orders. Thus, at least, we interpret the act of the dictator Camillus, who raised a temple to the goddess *Concord*, at the foot of the Capitol.

That these laws operated beneficially on the class in whose interest they were passed, viz., the plebeian-farmers or middle-class of the Roman state, is unquestionable; but events proved that they were inadequate to remedy the evil, and after a time they ceased to be strictly enforced. On the other hand, there can be as little doubt that, owing partly to these changes, and still more to the splendid and far-reaching conquests achieved in Italy during this period of internal strife by the Roman arms, the position of the plebeian farmer was decidedly raised. Not only were the 'general coffers filled' by the revenue drawn directly or indirectly from the subjugated lands, so that a *tributum* (a forced loan) seldom required to be enforced at home, but the numerous colonies which R. now began to send forth to secure her new acquisitions, consisted entirely of the poorer plebeians, who always received

a portion of the land in the district where they were settled. The long struggle between the two orders was thus virtually at an end; but the date usually assigned to the termination of the strife is 286 B.C., when the *Lex Hortensia* was passed which confirmed the Publilian Laws of 339 B.C., and definitely gave to the *Plebiscita* passed at the Comitia of the Tribes, the full power of laws binding on the whole nation. Gradually, however, by steps which we have not room to trace, the importance of the popular assemblies declined, and that of the senate rose. This was owing mainly to the ever-increasing magnitude of the Roman state, and to the consequent necessity of a powerful governing body. The senate, it will be remembered, originally possessed no administrative power at all, but now it commenced a series of vast usurpations of which the best defence is that they excited no opposition among the community. Every matter of general importance—war, peace, alliances, the founding of colonies, the assignation of lands, building, the whole system of finance—came under its supervision and authority. Nor, on the whole, did it prove itself the unworthy arbiter of a nation's destinies. It was not a self-elected oligarchy, but was rather composed of the ablest representatives of both orders.

2. *External History.*—We have said that the military successes of R. during this period of internal strife were great; but we can only briefly allude to them. The irruption of the Gauls into sub-Apennine Italy (391 B.C.), though accompanied by frightful devastations, was barren of results, and did not materially affect the progress of Roman conquest. No doubt the battle on the Allia, and the capture and burning of R. (390 B.C.), were great disasters, but the injury was temporary. The vigilance of Manlius saved the Capitol, and the heroism of Camillus revived the courage and spirit of the citizens. Again and again in the course of the 4th c. B.C., the Gallic hordes repeated their incursions into Central Italy, but never again returned victorious. In 367 B.C. Camillus defeated them at Alba; in 360 B.C., they were routed at the Colline Gate; in 358 B.C., by the dictator, G. Sulpicius Peticus; and in 350 B.C., by Lucius Furius Camillus. Meanwhile, aided by their allies, the Latins and the Hernicans, the Romans carried on the long and desperate struggle with the Æquians, Volscians, and Etruscans. Finally, but not till after they had sustained repeated defeats, the Romans triumphed. The causes that led to the decline of the Etruscan power, which, at the close of the regal period in R., and during the infancy of the republic, had been enormous, both by sea and land, cannot be considered at length here. Suffice it to say, that the terrible irruption of the Gallic barbarians into Etruria, and the victories of the Samnites in Campania, where also the Etruscans had established themselves, as well as the miserable jealousies of the different cities, combined to paralyse the power of this people, and paved the way for the final triumph of Rome. But even before the Gauls had crossed the Apennines, the fate of Etruria was virtually sealed. The fall of Veii (q. v.), 396 B.C., was really the death-knell of Etruscan independence. Although the story has undoubtedly descended to us in a mythical dress, the siege of Veii is by no means to be placed in the same category with the siege of Troy, albeit, like it, it is said to have lasted ten years. Falerii, Capena, and Volsinii—all sovereign cities of Etruria—hastened soon after to make peace, and by the middle of the 4th c. B.C., the whole of Southern Etruria had submitted to the supremacy of R., was kept in check by Roman garrisons, and denationalised

by the influx of Roman colonists. In the land of the Volsci, likewise, a series of Roman fortresses were erected to overawe the native inhabitants; Velitrae, on the borders of Latium, as far back as 492 B.C., Sueasa Pometia (442 B.C.), Circeii (393 B.C.), Satricum (385 B.C.), and Setia (382 B.C.): besides the whole Volscian district, known as the Pontine Marshes (q.v.), was distributed into farm-allotments among the plebeian soldiery. Becoming alarmed, however, at the increasing power of Rome, the Latins and Hernicans withdrew from the league, and a severe and protracted struggle took place between them and their former ally. Nearly thirty years elapsed before the Romans succeeded in crushing the malcontents, and restoring the league of Spurius Cassius. In the course of this war, the old Latin confederacy of the 'Thirty Cities' was broken up (384 B.C.), probably as being dangerous to the hegemony (now rapidly becoming a supremacy) of R., and their constitutions were more and more assimilated to the Roman. The terms of the treaty made by the Romans (348 B.C.) with the Carthaginians shew how very dependent was the position of the Latin cities. Meanwhile, the Romans had pushed their garrisons as far south as the Liris, the northern boundary of Campania. Here they came into contact with the Samnites (q.v.), a people as heroic as themselves, their equals in everything but unity of political organisation; perhaps their superiors in magnanimity.

The Samnites had long been extending their conquests in the south of Italy, just as R. had in the centre and in Etruria. Descending from their native mountains between the plains of Apulia and Campania, they had overrun the lower part of the peninsula, and under the name of Lucanians, Bruttians, &c., had firmly established themselves, threatening everywhere the prosperity of the Greek and Etruscan possessions in those regions. But it was the dwellers in the original mountain territory who properly bore the name of Samnites, and between them and the Romans now commenced a tremendous struggle; the former fighting heroically for the preservation of their national freedom—the latter warring with superb valour for dominion. We cannot afford space to recount the circumstances that brought about the collision, further than to state that the Samnite colonies had in the course of time become so detached in sympathy, and so changed in character and interests from the parent stock, as almost to forget their original unity. Hence, hostilities were common between them; and the forays of the Samnite Highlanders in the rich lowlands of Campania were dreaded above all things by their more polished but degenerate kinsmen of Capua, who had acquired the luxurious habits of the Greeks and Etruscans. It was really to save themselves from these destructive forays that the Campanians offered to place themselves under the supremacy of R.; and thus Romans and Samnites were thrown into a position of direct antagonism. The Samnite Wars, of which three are reckoned, extended over 53 years (343–290 B.C.). The second, generally known as the 'Great Samnite War,' lasted 22 years (326–304 B.C.). At first, the success was mainly on the side of the Samnites; and after the disaster at the *Caudine Forks* (q.v.), it seemed as if Samnium and not R. was destined to become the ruler of Italy, but the military genius of the Roman consul, Quintus Fabius Rullianus (see *FABIUS*), triumphed over every danger, and rendered all the heroism of Caius Pontius, the Samnite leader, unavailing. In 304 B.C., Bovianum, the capital of Samnium, was stormed, and the hardy Highlanders were compelled to acknowledge the supremacy of the republic.

The third war (298–290 B.C.) was conducted with all the sanguinary energy of despair; but though the Etruscans and Umbrians now joined the Samnites against the Romans, their help came too late. The victory of Rullianus and of P. Decius Mus at Sentinum (295 B.C.), virtually ended the struggle, and placed the whole of the Italian peninsula at the mercy of the victor. It only remains to be mentioned here that at the close of the first Samnite War, which was quite indecisive, an insurrection burst out among the Latins and Volscians, and spread over the whole territory of these two nations; but the defeat inflicted on the insurgents at Trifanum (340 B.C.) by the Roman consul, Titus Manlius Imperator Torquatus, almost instantly crushed it, and in two years the last spark of rebellion was extinguished. The famous Latin league was now dissolved; many of the towns lost their independence, and became Roman *municipia*; new colonies were planted both on the coast and in the interior of the Latino-Volscian region; and finally, so numerous were the farm-allotments to Roman burgesses, that two additional tribes had to be constituted.

From the Close of the Samnite to the Commencement of the Punic Wars.—The war with Pyrrhus (q.v.), king of Epirus, which led to the complete subjugation of Peninsular Italy, is a sort of pendant to the great Samnite struggle. It was brought about in this way. The Lucanians and Bruttians, who had aided the Romans in the Samnite Wars, considering themselves cheated of their portion of the spoil, entered into negotiations with the enemies of their former associate throughout the peninsula. A mighty coalition was immediately formed against R., consisting of Etruscans, Umbrians, and Gauls in the north, and of Lucanians, Bruttians, and Samnites in the south, with a sort of tacit understanding on the part of the Tarentines that they would render assistance by and by. The rapidity with which it took shape shews alike the fear and the hatred inspired by the Roman name. In the course of a single year, the whole north was arms, and once more the power, and even the existence of R., were in deadly peril. An entire Roman army of 13,000 men was annihilated at Arretium (284 B.C.) by the Senonian Gauls, but that dauntless spirit which the republic never failed to display in the crisis of its fortunes, which gives a sublime dignity to its worst actions, now shone out in the fullness of its splendor. Publius Cornelius Dolabella marched into the country of the Senones at the head of a large force, and literally extirpated the whole nation, which henceforth disappears from history. Shortly afterwards, the bloody overthrow of the Etruscan-Boian horde at Lake Vadimo (283 B.C.) shattered to pieces the northern confederacy, and left the Romans free to deal with their adversaries in the south. The Lucanians were quickly overpowered (282 B.C.); Samnium, broken by its long and leaderless struggle, and overawed by the proximity of a Roman army, could do nothing. A rash and unprovoked attack on a small Roman fleet brought down on the Tarentines the vengeance of R., at the very moment R. was free to exert her terrible power. Awakening to a sense of the danger, the Tarentines invited Pyrrhus (q.v.) from Epirus, and appointed him commander of the mercenaries. This royal adventurer, a man of the most brilliant, but also of the most volatile genius, resembling no modern general so much as Charles Mordaunt, Earl of Peterborough, arrived in Italy (280 B.C.) with a small army of his own, and a vague notion in his head of founding a Hellenic empire in the west, that should rival that created

in the east by his kinsman, Alexander the Great. It is not necessary to narrate here the varying fortunes of the struggle between Pyrrhus and the Romans, which lasted only six years, and ended in his being obliged to return to Epirus without accomplishing anything.

After Pyrrhus, baffled in his attempts to check the progress of R., had withdrawn to Greece, the Lucanians and Samnites, whom his reputation and original successes had induced to rise once more against the dreaded foe, continued the unequal struggle, but 'even the bravery of despair,' as it has been said, 'comes to an end; the sword and the gibbet at length (269 B.C.) carried peace even into the mountains of Samnium.' Tarentum had surrendered three years earlier; and now from the Macra and the Rubicon to the Straits of Messina, there was not a nation in Italy that did not acknowledge the supremacy of Rome. Distant kingdoms began to feel that a new power had risen in the world; and when Ptolemy Philadelphus, sovereign of Egypt, heard of the overthrow of the famous Epirote warrior, he sent an embassy to R. (273 B.C.), and concluded a treaty with the republic. To secure their new acquisitions, the Romans established in the south military colonies at Paestum and Cosa, in Lucania (273 B.C.); at Beneventum (268 B.C.), and at *Faernia* (263 B.C.), to overawe the Samnites; and in the north, as out-posts against the Gauls, Ariminum (268 B.C.), Firmum in Picenum (264 B.C.), and the burgess colony of Castrum Novum. Preparations were also made to carry the great Apian highway as far as Brundisium, on the Adriatic, and for the colonisation of the latter city as a rival emporium to Tarentum.

The political changes were almost as important as the military. The whole population of Peninsular Italy was divided into three classes—1. *Cives Romani*, or such as enjoyed the full burgess privileges of Roman citizens; 2. *Nomen Latinum*—that is, such as possessed the same privileges as had been enjoyed by the members of the quondam Latin league—viz., an equality with the Roman burgesses in matters of trade and inheritance, the privilege of self-government, but no participation in the Roman franchise, and consequently no power to modify the foreign policy of the state; 3. *Socii*, or 'Allies,' to some of whom were conceded most liberal privileges, while others were governed in an almost despotic fashion. The *Cives Romani* no longer embraced merely the inhabitants of the old Roman community, the well-known 'tribes' (of whom there were now thirty-three), but all the old burgess-colonies planted in Etruria and Campania, besides such Sabine, Volscian, and other communities as had been received into the burgess body on account of their proved fidelity in times of trial, together with individual Roman emigrants or families of such, scattered among the *municipia*, or living in villages by themselves. The cities possessing the *Latinum Nomen* included most of the 'colonies' sent out by R. in later times, not only in Italy, but even beyond it; the members of which, if they had previously possessed the Roman franchise, voluntarily surrendered it in lieu of an allotment of land. But any 'Latin' burgess who had held a magistracy in his native town, might return to R., be enrolled in one of the tribes, and vote like any other citizen. The *Socii* comprised all the rest of Italy, as the Hernicans, the Lucanians, Bruttians, the Greek cities, &c. All national or cantonal confederacies and alliances among the Italians were broken up, and no means were left unemployed by the victors to prevent their restoration.

The Punic Wars.—The origin of Carthage, and

the steps by which she rose to power, are sketched in the article CARTHAGE. At the time when she came into collision with R. she was indisputably the first maritime empire in the world, ruling as absolutely in the central and western Mediterranean seas as R. in the Italian peninsula. Between the Carthaginians and the Romans there had long existed a nominal alliance—the oldest treaty dating as far back as the 6th c. B.C. But this alliance had never possessed any real significance, and latterly the two nations had come to regard each other with considerable distrust. The incident that occasioned the outbreak was quite trivial, and need not be recorded. Suffice it to say that in 264 B.C., war was formally declared between the two nations, and incomparably the most terrible contest in which R. was ever engaged, began.

We do not propose to follow minutely the course of the famous Punic Wars—the details of which are narrated at sufficient length under the heads CARTHAGE, HAMILCAR, HANNIBAL, HASDRUBAL, HIERO, REGULUS, METELLUS, FABIUS, MARCELLUS, SCIPIO, and NUMIDIA, to which we refer the reader, but we may briefly indicate their character and result. The wars with Carthage, like those with Samnium, were three in number. The first lasted 23 years (B.C. 264–241), and was waged mainly for the possession of Sicily. Its leading feature was the creation of a Roman navy, which, after repeated and tremendous misfortune, finally wrested from Carthage the sovereignty of the seas. R., indeed, had never been a merely agricultural state, as may be inferred from a variety of particulars—e.g., the antiquity of the galley in the city arms, of the port-dues on the exports and imports of Ostia, and of commercial treaties with transmarine states—but events had hindered it from engaging to any large extent in maritime enterprise; and its shipping, or at least its fleet, was still quite insignificant, although it had become master of nearly all the Italian seaboard. The necessity for a navy now began to shew itself. Not only was there a difficulty felt in transporting troops to Sicily, but the shores of the mainland were completely exposed to the ravages of Carthaginian squadrons. So energetically did the senate set to work, that (we are told) in sixty days from the time the trees were felled, 120 ships were launched, and soon after the consul Caius Duilius gained a brilliant success (260 B.C.) over the Carthaginians off Mylae, on the north-east coast of Sicily. The exultation of the Romans knew no bounds; and the 'triumph' which Duilius received on his return to the city, had more the aspect of a carnival than of a noble ceremony. The *Columna Rostrata* ('Beaked Column') in the Forum preserved for ages the memory of the 'glorious victory.' Subsequent events, however, were less favourable. An invasion of Africa by Regulus (q.v.) ended in disaster, and the war, which was henceforth confined to Sicily, miserably languished. Thrice was the Roman navy annihilated by storms at sea (255 B.C., 253 B.C., and 249 B.C.); and in spite of a series of unimportant successes by land, the Romans long found it impossible to make any impression on the great Carthaginian strongholds of Lilybæum and Drepanum, mainly on account of the brilliant strategy with which they were held in check by Hamilcar Barca, the father of Hannibal. At last, however, a great sea-fight took place off the *Ægates* isles (242 B.C.), in which a Roman fleet, commanded by the consul Lutatius Catulus, obtained a magnificent victory. The Carthaginian government, whose treasury was empty, and who had in vain tried to raise a state-loan in Egypt, could—for the present—continue the struggle no longer, and the whole of Sicily, except the territory of Hiero of Syracuse,

who had been a firm ally of the Romans, passed into the hands of the victors, who constituted it a Roman province, and placed it under the government of a praetor.—A lapse of 23 years occurred before the second Punic War began, but during that interval neither Romans nor Carthaginians had been idle. The former, with worse than 'Punic faith,' had bullied their weak and exhausted rival into surrendering Sardinia and Corsica, which, like Sicily, were transformed into a Roman province. In addition, they had carried on a series of Gallic wars in Northern Italy (231–222 B.C.), the result of which was the complete humiliation of the barbarian Boii, Insubres, &c., and the extension of Italy to its natural boundary—the Alps. On the eastern coast of the Adriatic also, the Romans made their power felt, by the vigour with which they suppressed Illyrian piracy (219 B.C.). Meanwhile, the descent of Hamilcar on the Spanish coast was followed, after some ineffectual opposition on the part of the natives, by the establishment of a new Carthaginian empire, or at least a protectorate, in the west; and thus, almost before the Romans were aware of it, their hated rival had made good her losses again, and was even able to renew the struggle in a more daring fashion than before. How confident the bearing of the Carthaginians had now become, may be seen from the fearless spirit in which they accepted the Roman challenge, and entered on the *second Punic*—or (as the Romans called it) the *Hannibalic*—War, the grand events of which were the crossing of the Alps by Hannibal, the terrible disasters of the Romans at Lake Trasimene (q.v.) and Cannæ (q.v.), and the final overthrow of Hannibal at Zama (q.v.), 202 B.C., by Scipio, which once more compelled the Carthaginians to sue for peace. It was with Carthage as with Samnium. The *second* war virtually sealed her fate, and the *third* displayed only the frantic heroism of despair. Her Spanish possessions, like her Sicilian, passed to the Romans (who formed out of them the provinces of *Hispania Citerior* and *Hispania Ulterior*); so did her protectorate over the Numidian sheiks. She was forced to surrender her whole navy (excepting ten triremes), and all her elephants, and to solemnly swear never to make war either in Africa or abroad, except with the consent of her vanquisher. In a word, the imperial supremacy of R. was now as unconditional in the western Mediterranean as on the mainland of Italy. Her relations, indeed, to the conquered Italian nationalities became much harsher than they had formerly been, for, after the first victories of Hannibal, these had risen against her. The Picentes, Brutii, Apulians, and Samnites, were deprived either of the whole or the greater part of their lands—some communities were actually turned into serfs—the Greek cities in Lower Italy, most of which had also sided with Hannibal, became the seats of bourgeois-colonies. But the loss of life and of vital prosperity was frightful. 'Numbers of flourishing townships,' says Mommsen, '400 it was reckoned, were destroyed and ruined.' Slaves and desperadoes associated themselves in robber-bands, of the dangers of which an idea may be formed from the fact that in a single year (185 B.C.) 7000 men had to be condemned for robbery in Apulia alone; the extension of the pastures with their half-savage slave-herdsmen, favoured this mischievous barbarising of the land. But the exultation of victory closed the eyes and the ears of the Romans against every omen, and the perilous work of conquest and subjugation went on. During 201–196 B.C., the Celts in the valley of the Po, who, with the fiery unwisdom of their race, had recommenced hostilities at the very moment R. was freed from her embarrassments, were thoroughly

subjugated; their territory was Latinised, but they themselves were declared incapable of ever acquiring Roman citizenship; and so rapidly did their nationality dissolve, that when Polybius, only 30 years later, visited the country, nearly all traces of Celtic characteristics had disappeared. The Boii were finally extirpated about 193 B.C.; the Ligurians were subdued 180–177 B.C.; and the interior of Corsica and Sardinia about the same time. The wars in Spain were troublesome and of longer duration, but they were not at all serious. The natives were indeed perpetually in arms, and the Romans suffered frequent defeats from their sudden and impetuous insurrections; but in the end the superior discipline of the legions always prevailed, and the fiery and chivalrous tribes had of course to make ignominious submission. So little reliance, however, could be placed on these forced submissions, that the Romans felt it necessary to hold Spain by military occupation, and hence arose the first Roman standing armies. Forty thousand troops were maintained in the Spanish peninsula year after year. The most distinguished successes were those achieved by Scipio himself, by Quintus Minucius (197–196 B.C.), by Marcus Cato (195 B.C.), by Lucius Æmilius Paulus (189 B.C.), by Cains Calpurnius (185 B.C.), by Quintus Fulvius Flaccus (181 B.C.), and by Tiberius Gracchus (179–178 B.C.).

Macedonian and Greek Wars.—The causes that led to the interference of R. in the politics of the East are too complicated to be given here, but the *Macedonian Wars* were owing immediately to the alliance formed by Philip V. of Macedon with Hannibal after the battle of Cannæ. Like the Samnite and Punic, the Macedonian Wars were three in number. The *first* (214–205 B.C.) was barren of results, mainly because the whole energies of R. were directed to Spain and Lower Italy; but the *second* (200–197 B.C.), though it lasted only a third of the time occupied by the first, taught Philip that another and not he must rule in Greece. The battle of *Cynoscephalæ* ('Dogs' Heads' Hills, a range in Thessaly) was followed by a treaty which compelled him to withdraw his garrisons from the Greek cities, to surrender his fleet, and to pay 1000 talents towards the expenses of the war. Philip was thoroughly quelled, and during the remaining 18 years of his life, he adhered (like old Hiero of Syracuse, though less sincerely) to his Roman alliance. But the miserable Ætolians, who had formed an alliance with R. against Philip, with even more stupidity than insolence, quarrelled in wanton jealousy with their powerful 'friends,' and persuaded Antiochus (q.v.) of Syria to come over seas to Thessaly, and fight them. A similar fate befell him to what had befallen Philip. After a war of three years, he found himself obliged to surrender all his possessions in Europe and Asia Minor, all his elephants and ships, and to pay 1500 Euboic talents (£3,660,000) within 12 years. Next year the Ætolians were crushed, and a little later the despicable quarrels between the Achæans and Spartans led to a general Roman protectorate over the whole of Greece.

Philip of Macedon dying (179 B.C.), was succeeded on the throne by his eldest son Perseus (q.v.), who resolved once more to try the fortune of war with the Romans; and in 172 B.C., the *third* and *last* Macedonian War began, the result of which, after four years of fighting, was the utter destruction of the Macedonian army at Pydna (168 B.C.) by the Roman consul Lucius Æmilius Paulus (q.v.), the capture of the king, who adorned the triumph of the conqueror, and the dismemberment of the Macedonian empire, which was broken up

into four oligarchic republics, the members of which were subjected to severe disqualifications; while in Greece itself, trials and executions for implication in the war of Perseus spread terror everywhere; the conspicuous 'patriots'—i. e., all who had made themselves notorious by their anti-Roman and Macedonian policy—were deported to Italy; further, the imperial republic stopped Antiochus Epiphanes in his career of Egyptian conquest, ordered him instantly to abandon his acquisitions, and accepted the protectorate of Egypt, which the grateful and frightened monarch offered her (168 B. C.). Even the allies of Rome—the Pergamene, the Rhodians, &c.—were treated with shocking harshness and injustice. We may here, for the sake of connection, anticipate the course of history, and mention the last Greek and Punic Wars. Both of these came to an end in the same year (146 B. C.). The former was caused by an expiring outburst of pseudo-patriotism in the Achaian League, consequent on the return of the exiles from Rome, and was virtually closed on the destruction of Corinth (q. v.) by the consul Mummius (q. v.). The latter was not so much a war as a bloody sacrifice to the genius of Roman ambition. After Hannibal's death, his party in Carthage seems to have recovered the ascendancy, and as coincident therewith, the commercial prosperity of the city began to revive, a bolder front was shewn in resisting the encroachments of Masinissa, the Numidian ruler, whom the Roman senate protected and encouraged in his aggressions. This was enough. Fierce old Cato only expressed the instinctive sentiment of the Roman burghers, when he came to utter incessantly *Delenda est Carthago*, and in 149 B. C., the senate adopted his barbarous conviction. After a siege of three years, in which the inhabitants displayed superhuman energy and heroism, Carthage was stormed by Scipio Africanus Minor, and the Carthaginian empire vanished for ever from the earth.

Position of Rome at the close of the Punic Wars, and sketch of its subsequent Social Condition to the termination of the Republic.—Polybius dates from the battle of Pydna the full establishment of the universal empire of Rome. It was in fact the last battle in which a civilised state confronted Rome in the field on a footing of equality with her as a great power; all subsequent struggles were rebellions or wars with peoples beyond the pale of the Romano-Greek civilisation—the barbarians, as they were called. The whole civilised world thenceforth recognised in the Roman senate the supreme tribunal, whose commissioners decided in the last resort between kings and nations; and, to acquire its language and manners, foreign princes and noble youths resided in Rome. But contemporaneous with this enormous extension of power and authority in foreign lands, the national character underwent a complete and fatal alteration. The simplicity and stern integrity of life, the religious gravity of deportment, and the fidelity with which common civic and household duties were discharged—well expressed in the saying of Cato, that it was 'better to be a good husband than a great senator'—which in early times nobly distinguished the Roman burghers, had now all but disappeared. Those hardy virtues—frugality, temperance, justice, and rectitude—which, combined with courage and energy, had given the strength to the nation that made it great, required for their permanence the social conditions out of which they sprang. But the class of peasant proprietors who had laid the foundations of Roman greatness were either extinct or no longer what they once had been. The original causes of their social degradation have been already

noticed, and here it is only necessary to say that the victories of R. abroad furthered rather than retarded that degradation. The long and distant wars made it more and more impossible for the soldier to be a good citizen or a successful farmer. The freedom and licentiousness of camp-life, the sweets of pillage and rapine, ever grew more pleasant to the Italian burghers and colonist; thus indolence, inaptitude, and spendthrift habits aided the greedy designs of the capitalists, and in most cases the paternal acres gradually slipped into the possession of the great landlords, who found it more profitable to turn them into pasture or cultivate them by gangs of slaves. The rise of the slave-system—though an inevitable result of foreign conquest—was, indeed, the most horrible curse that ever fell on ancient R., and the atrocities inflicted on its unhappy victims are far beyond the possibility of description; Mommsen does not exaggerate when he considers it probable that, 'compared with the sufferings of the Roman slaves, the sum of all negro suffering is but a drop.' If the Italian farmer honourably strove to retain his small farm, he was exposed to the competition of the capitalists who shipped immense quantities of corn from Egypt and other granaries, where slave-labour rendered its production cheap, and of course he failed in the unequal struggle. Not less pernicious was the change that passed over the character of the rich. We have already shewn how the old Roman patricians lost their exclusive privileges, how the plebeians gradually acquired a full equality with them, and how the germs of a new social aristocracy originated, based on wealth rather than pedigree, and comprising both plebeians and patricians. During the 4th and 3d centuries B. C., the political power of this order immensely increased. In fact, the whole government of the state passed into their hands. They became an oligarchy, and while it is not to be denied that they displayed extraordinary ability in the conduct of foreign affairs, the vices inseparable from oligarchic rule—selfishness, nepotism, and arrogance, of which Scipio is a striking example—gradually became rampant. Regarding themselves as the Roman community *par excellence*, and the poor burghers as a mere *canaille*, whose wishes and interests were unworthy of a moment's consideration, they virtually relapsed into the exclusiveness of the ancient *populus*, with this difference for the worse, that their wealth, influence, and pride were a thousandfold greater than those of Coriolanus or Camillus. But far worse than even the nepotism and selfishness of the nobles was their ever-increasing luxury and immorality. When R. had conquered Greece, and Syria, and Asia Minor, the days of her true greatness were ended. The wealth that poured into the state coffers, thence to be (really if not formally) distributed among the clique of nobles, the treasures which victorious generals acquired, enabled them to gratify to the full the morbid appetites for pleasure engendered by exposure to the voluptuousness of the East. Such results were, it is true, not brought about in a day, nor without a resolute protest on the part of individual Romans. The attitude of Cato Major towards the Hellenising tendencies of his brother nobles was doubtless patriotic, and posterity has been generous in its laudation of his antique virtue; but Cato Major was nevertheless only a political fanatic and incarnate anachronism. So long as R. chose to subdue foreign nations, and to hold them by the demoralising tenure of conquest—i. e., as mere *provinces*, whose inhabitants, held in check by a fierce and unscrupulous soldiery (like the Kabyles of Algeria by the French, or, until recently, the Hindus by the British), neither possessed

political privileges nor dared cherish the hope of them—it was morally impossible for the citizens, either at home or abroad, to resume the simple and frugal habits of their forefathers. After Cato's time, things grew worse instead of better, nor from this period down to the final dissolution of the empire, was a single radical reform ever permanently effected. The momentary success of Tiberius, and of his far abler brother, Caius Gracchus (q. v.), in their desperate and revolutionary attempts to prevent the social ruin of the state, by breaking down the powers of the senate, redistributing the domain lands, reorganising the administration, and partially restoring the legislative authority of the popular assemblies, hardly survived their death; and the reaction that ensued proved that the senate, like the Bourbons, could learn nothing from adversity, and that the rabble of the city were incapable of elevation or generosity of political sentiment. Henceforth, the malversation of the public money by prætors and quaestors became chronic, and the moral debauchery of the mob of the capital by the largesses of ambitious politicians and the vile flattery of demagogues, complete. The old Roman faith, so deep, and strong, and stern, disappeared from the heart. The priests became Pharisees, the nobles 'philosophers' (i. e., unbelievers), their wives practisers of oriental abominations under the name of 'mysteries'; while the poor looked on with unmeaning, yet superstitious wonder at the hollow but pompous ceremonies of religion. It would serve no useful purpose to dwell longer on these aspects of Roman society, and we now turn to sketch in a few words the course of outward events to the close of the republic.

From the Destruction of Carthage to the Termination of the Republic.—We have already alluded to the wars waged in Spain during the first half of the 2d c. B.C. The humane and conciliatory policy pursued towards the natives by Tiberius Sempronius Gracchus, father of the ill-fated tribunes, brought about a peace, 179 B.C., that lasted 25 years; but in 153 B.C., a general rising of the Celtiberians took place, followed by another on the part of the Lusitanians of Portugal. The struggle maintained by these gallant barbarians against their mighty oppressor lasted, with intervals of peace, for the space of 20 years, but ended, in spite of gleams of brilliant success, as such contests invariably do, in the final overthrow of the undisciplined and uncivilised combatant. All the valour of the shepherd-warrior, Viriathus (q. v.), even if the assassin's steel had spared his life, would not have prevented the annexation of Lusitania to the Roman empire, nor did the unsurpassable heroism of the besieged Numantines avail to baffle the military skill of the younger Scipio.

Towards the conclusion of the Numantine War occurred the first of those horrible social outbreaks known as 'servile' or 'slave' wars, which marked the later ages of the republic. The condition of the slaves has been already referred to; but what aggravated the wretchedness of their lot was the fact that most of them had been originally freemen—not inferior in knowledge, skill, or accomplishments to their masters, but only in force of character and military prowess. The first slave insurrection broke out in Sicily, 134 B.C., where the system was seen at its worst. Its leader was one Eunus, a Syrian, who, mimicking his native monarch, took the title of King Antiochus. The suddenness and barbaric fury of the revolt for a time rendered all opposition impossible. The slaves overran the island, like demons let loose; and routed one Roman army after another. But a slave insurrection has no aim beyond immediate revenge, and when the first wild

paroxysms of ferocity are over, it becomes powerless, more even from a moral than a physical exhaustion, and can be quelled with ease. In 132 B.C. the consul Publius Rupilius restored 'order' in the island. In the East, fortune continued to smile upon the Roman arms. Attalus III., Philometor, a villainous despot of the true oriental stamp, who massacred or poisoned every one that ventured to give him advice, dying 133 B.C., bequeathed his client-kingdom of Pergamus to its protector—Rome, and after a fierce struggle with an ambitious pretender called Aristonicus, the Romans obtained possession of the splendid bequest, and formed it into the province of Asia, 129 B.C.

We may here enumerate the different provinces into which the Roman senate divided its foreign conquests, in the order of their organisation. 1. Sicily, 241 B.C.; 2. Sardinia and Corsica, 238 B.C.; 3. Hispania Citerior, and 4. Hispania Ulterior, 205 B.C.; 5. Gallia Cisalpina, 191 B.C.; 6. Macedonia, 146 B.C.; 7. Illyricum, circa 146 B.C.; 8. Achaia (or Southern Greece), circa 146 B.C.; 9. Africa (the Carthaginian territory), 146 B.C.; 10. Asia (kingdom of Pergamus), 129 B.C. A few years later, 118 B.C., an 11th was added by the conquest of the southern part of Transalpine Gaul, as it was commonly called, to distinguish it from the rest of the country, 'the Province'; hence the name *Provincia*.

In Africa, the overthrow of Jugurtha (q. v.), 104 B.C., by the consul Marius, added yet further to the military renown and strength of the republic. Meanwhile, from a new quarter of the world's gigantic and unforeseen danger threatened the Roman state. North of the Alps there had long been roaming in the region of the Middle Danube an unsettled people called the CIMBRI (q. v.), whose original home was probably the north-west of Germany. They first came into collision with the Romans in Noricum, 113 B.C.; after which they turned westward, and poured through the Helvetic valleys into Gaul, where they overwhelmed all the native tribes and the Roman armies. At Arausio (Orange) on the Rhône, 105 B.C., a Roman army of 80,000 was annihilated; but instead of invading Italy, the barbarians blindly rushed through the passes of the Pyrenees, wasted precious months in contests with native tribes of Spain as vain and hardy as themselves, and gave the Romans time to recover from the effects of their terrible defeat. Marius, who had just returned from his Numidian victories, was reappointed consul; and at Aqua-Sextiæ (Aix, in Dauphiny), he literally exterminated the dreaded foe, 102 B.C. Next year, near Milan, the same doom befell another northern horde—the Teutones, who had accompanied the Cimbri in their irruption into Spain; but on their withdrawal, had parted from their associates in Gaul, forced their way back through Switzerland, and descended into Italy by the Tyrolean valleys. In the same year a second insurrection of the slaves in Sicily, which had reached an alarming height, was suppressed by the consul Marcus Aquilius.

For the next 10 years the internal history of Rome is a scene of wild confusion and discord. Marius, an admirable soldier, but otherwise a man of mediocre talents, and utterly unfit to play the part of a statesman, was the idol of the poor citizens who urged him to save the state from the rapacious misgovernment of the rich. His attempts were pitiable failures; the brave honest soldier fell into the hands of unscrupulous demagogues like Glaucias and Saturninus, and sullied the laurels he had won in war by associating with men who did not hesitate to assassinate a political opponent. Not less fruitless was the wise and patriotic effort of Livius

ROME.

Drusus—'the Gracchus of the aristocracy'—to effect a compromise between the privileges of the rich and the claims of the poor. The oligarchic party among the former, i.e. the senate, were enraged by his proposition to double their numbers by the introduction of 300 equites; the latter by his offer to the 'Latins' and 'Allied Italians' of the Roman franchise. Drusus fell 91 B.C., by the steel of a hired bravo. Hardly a year elapsed before the whole of the subject 'Italians'—i.e. the Marsians, Pelignians, Marrucinians, Vestinians, Picentines, Samnites, Apulians and Lucanians—were up in wild and furious revolt against R.; and, though the rebellion was crushed in less than two years by the superior generalship of Marius, Sulla, and Pompeius Strabo (father of the 'great' Pompey), the insurgents virtually triumphed; for the promise which Drusus had held out to them of the 'Roman franchise,' was made good by the *Lex Plautia Papiria* 89 B.C. Yet the cost was terrible. It is calculated that 300,000 men—the flower of R. and Italy, perished in the struggle; nor was even this tremendous holocaust sufficient to appease the Fates. The jealousy that had long existed on the part of Marius towards his younger and more gifted rival, Sulla (q.v.), kindled into a flame of hate when the latter was elected consul 88 B.C., and received the command of the Mithridatic War—an honour which Marius coveted for himself. Then followed the fearful years of the 'civil wars' between the two chiefs, 88–82 B.C., when blood was spilt like water; and proscriptions and massacres were the order of the day. It was a 'Reign of Terror'—surpassing even the excesses of the French Revolutionists. Sulla, the leader of the aristocracy, which was nominally the party of order, triumphed, but the ferocious energy displayed by the revolutionists convinced him that the 'Roman franchise' could never again be safely withdrawn from the 'Italians;' and Roman citizens, therefore, they remained till the dissolution of the empire; but, on the other hand, his whole legislation was directed towards the destruction of the political power of the burgesses, and to the restoration to the senatorial aristocracy and priesthood of the authority and influence they had possessed in the times of the Punic Wars. That his design was to build up a strong and vigorous executive cannot admit of doubt, but the rottenness of Roman society was beyond the reach of cure by any human policy. It would be hopeless in our limits to attempt even the most superficial sketch of the complicated history of this period, which, besides, will be found given with considerable fullness of detail in the biographies of its leading personages, SERTORIUS, LUCULLUS, CRAWFUS, POMPEY, MITHRIDATES, CÆSAR, CICERO, CATILINE, MARK ANTONY, LEPIDUS, CLEOPATRA, CLODIUS, BRUTUS, CASSIUS, CATO, and AUGUSTUS. The very utmost we can attempt is to enumerate results.

Abroad the Roman army continued as before to prove irresistible. About 13 years after the extermination of the northern barbarians, the Cimbri and Teutones, or in 88 B.C., broke out in the far east the first of the 'Mithridatic Wars,' which, like the Samnite, Punic, and Macedonian Wars, were three in number. Begun by Sulla, 88 B.C., they were brought to a successful close by Pompey, 65 B.C., although the general that had really broken the power of Mithridates was Lucullus. The result was the annexation of the sultanate of Pontus, as a new province of the Roman republic. Next year, Pompey marched southward with his army, deposed Antiochus Asiaticus, king of Syria, and transformed his kingdom also into a Roman province, while in the following year (63 B.C.) he reduced to a state of

dependence Phœnicia, Coele-Syria, and Palestine, storming Jerusalem, and, to the horror of the Jews, violating their Holy of Holies. But what a terrible commentary it is upon these glittering triumphs to remember that during the same year there was hatched at R. the Conspiracy of Catiline (q.v.), which, if it had not been crushed by an extraordinary display of decision on the part of the consul Cicero, would have placed at least the city of R. at the mercy of a crew of aristocratic desperadoes and out-throats. One thing now becomes particularly noticeable, viz. the paralysis of the senate—that 'governing board' as Mommsen calls it, that had once been the mightiest power in the world. In spite of all that Sulla did to make it once more the governing body in the state, the power passed out of its hands. Torn by wretched jealousies, spites, piques (personal and partisan), it could do nothing but squabble or feebly attempt to frustrate the purpose of men whom it considered formidable. Henceforth the interest as well as the importance of Roman history attaches to individuals, and the senate sinks deeper and deeper into insignificance, until at last it becomes merely the obsequious council of the emperors. The famous coalition of Crassus, Pompey, and Cæsar (known as the *First Triumvirate*), which dates from the year 60 B.C., proves how weak the government and how powerful individuals had become; and the same fact is even more dismally brought out by the lawless and bloody tribunates of Clodius and Milo (58–57 B.C.), when R. was for a while at the mercy of bravos and gladiators. The campaigns of Cæsar in Gaul (58–50 B.C.), by which the whole of that country was reduced to subjection; his rupture with Pompey; his defiance of the senate; the civil wars; his victory, dictatorship, and assassination; the restoration of the senatorial oligarchy; the second triumvirate, composed of Antony, Lepidus, and Octavian; the overthrow of the oligarchy at Philippi; the struggle between Antony and Octavian; the triumph of the latter, and his investment with absolute power for life (29 B.C.), which put an end at least to the civil dissensions that had raged so long (and was therefore so far a blessing to the state), are described in the biographical articles already referred to.

THE ROMAN EMPIRE.—When Augustus had gathered up into himself all the civil and military powers of the state, its political life was at an end; henceforth the voices of the citizens are dumb, and only the rude clamour of the legions or the Prætorians (q.v.) is heard, as emperors rise and fall. It is, indeed, amazing to consider how long brute force managed to keep under the elements of anarchy and dissolution in the empire; but it must be remembered that it was the East that ruined R., and not R. the East. Even in the worst days of the republic, the Roman administrators of the provinces were acknowledged to be less unjust, ravenous, tyrannical, and cruel than the native princes and sultans; and the servile myriads of Asia Minor and Syria witnessed the deposition of their dynasts without a shadow of regret—sometimes even with a cry of joy. The Romans had therefore comparatively little difficulty in retaining and even increasing their eastern conquests, while the superior discipline of their well-trained soldiery enabled them to repel and subdue even the intrepid barbarians of the North, though singly these were probably more gallant men than the rank and file of the imperial legions. But no military prowess, however great, will, beyond a certain time, serve to keep a nation alive that is otherwise moribund; and even Christianity, with all its antiseptic and revivifying influences, came

too late to reanimate the national life of the empire. When Augustus died (14 A.D.), the Roman empire was separated in the north from Germany by the Rhine, but it also included both Holland and Friesland; from about the Lake of Constance it ran along the Danube to Lower Mœsia, though the imperial authority was far from being firmly established there. In the east, the boundary-line was, in general, the Euphrates; in the south, Egypt, Libya, and, in fact, the whole of Northern Africa, as far west as Morocco, and as far inland as Fezzan and the Sahara, acknowledged Roman authority. The Roman franchise was extended to transmarine communities, and in the western provinces especially it became quite common. To keep this enormous territory, containing so many different races, quiet, an army of 47 legions and as many cohorts was maintained, most of whom were levied among the newly-admitted burgesses of the western provinces. The reigns of Tiberius (q. v.), Caligula (q. v.), Claudius (q. v.), Nero (q. v.), Galba (q. v.), Otho (q. v.), and Vitellius (q. v.), present little of any moment in a general survey of the external history of the empire, though the chronicle of their lives—those of Galba and Otho, perhaps, excepted—has all the horrible and revolting interest that attaches to records of conspiracy, assassinations, poisonings, massacres, lust, debauchery, and delirious madness. The most notable incident of this period is probably the concentration of the Prætorian Guards in the vicinity of R. during the reign of Tiberius, which Niebuhr even pronounces 'the most momentous event in the history of the emperors;' and not without reason, for, until their dissolution by Diocletian, they were the real sovereigns of the empire. In Nero's time, Armenia was wrested from the Parthians, and only restored to them on condition of their holding it as a 'fief' of the empire; the Roman authority in England was likewise extended as far north as the Trent; and a great rebellion in Gaul (not, however, against R., but only against Nero), headed by Julius Vindex, a noble Aquitanian and a Roman senator, was crushed by T. Virginus Rufus, the commander of the Germanic legions. During the profound peace that the empire had enjoyed everywhere, except on its frontiers—since the usurpation of the imperial authority—its material prosperity had greatly increased. The population was more than doubled; the towns became filled with inhabitants, and the wastes were peopled, wherever, at least, the Publicani (q. v.) or farmers-general had not got the land into their rapacious hands; but the immorality of the rich, especially among the females, became yet worse than before, and virtuous men actually preferred concubinage with a slave, to marriage with a free-born Roman lady.

With the accession of Vespasian (q. v.) a better era commenced, which, if we except the reign of Domitian, continued uninterrupted for a space of 100 years, comprising the reigns, besides those mentioned, of Titus (q. v.), Nerva (q. v.), Trajan (q. v.), Hadrian (q. v.), Antoninus Pius (q. v.), and Marcus Aurelius (q. v.). These were all men of fine and honourable character—some, as e. g., Trajan, Hadrian, and Marcus Aurelius, were really illustrious rulers, worthy of the best days of Rome. Under all of them the provinces were better governed, the finances better administered, and public morals wonderfully improved. Nothing, indeed, is more clear than that, after the time of Vespasian, that *restaurator rei publicæ*, as he has been justly called, the worst days of Rome (in a moral point of view) were over. Never again did she give way to the horrible sensuality, gluttony, and profligacy of the 1st century. Bad emperors

she had as well as good, but they did not again succeed in corrupting their age. Blood, indeed, was shed freely enough, hostilities on the frontiers were as frequent as ever, and the violence and selfishness of military ambition were things that paganism did not seek, and had not the power, to quell; but the wild abyss of anarchy into which the empire latterly fell is less dreadful than the saturnian of vice that filled the soul of Juvenal with indignation in the days of Domitian. How far the change was due to the influence of the ever-extending Christian religion, it is impossible to tell; but that Christianity did send a reinvigorating breath of new life through the old decaying body of the state is beyond all dispute, and is written on the very face of the history of the first centuries. The chief military events, from the days of Vespasian to those of Marcus Aurelius, are the final conquest of Britain by Agricola (q. v.), the final conquest of the Dacian monarchy, the victorious invasion of Parthia and of Northern Arabia; and the conquest of the valley of the Nile as far south as Upper Nubia, by Trajan; the chastisement of the Marcomanni, Quadi, Chatti, &c., by Marcus Aurelius. Hadrian's long rule of 21 years was peaceful, but memorable as the most splendid era of Roman architecture. The reigns of Commodus (q. v.), Pertinax (q. v.), and Didius Julianus (q. v.) were insignificant, except in so far as they shew us the wretched confusion into which the administration of affairs inevitably fell when bad, or hated, or feeble rulers were invested with the purple. Able generals, respectable jurists, honourable senators are wanting, but their influence is personal and local. The reign of Septimius Severus (193–211 A.D.) is memorable as marking the first real change in the attitude of the emperors towards Christianity. The new religion was beginning to make itself felt in the state; and Severus, who was a Carthaginian, while his wife was a Syrian, may have felt a special interest in a faith that like themselves was of Semitic origin. At all events it was taken under the imperial protection, and began to make its way. Caracalla (q. v.) and Elagabalus (q. v.) are perhaps the worst of all the emperors in point of criminality; but the mad brutality of the one and the monstrous debauchery of the other were purely personal affairs, and were regarded with horror by the citizens of the empire. The reign of Alexander Severus is marked by the downfall of the Parthian dynasty of Persian kings, and the rise of the Sassanides (q. v.), which, as Niebuhr observes, 'was one of the unluckiest things that could have happened to the Roman empire,' for the latter proved far more formidable enemies than the Parthian rulers. After the assassination of Severus (235 A.D.) followed a period of confusion, bloodshed, and general mismanagement. The names of Maximus (q. v.), Maximus (q. v.), Balbinus (q. v.), Gordianus (q. v.), and Philip (q. v.), recall nothing but wretched quarrels, often ending in assassination. Then followed 'the beginning of the end.' The whole of Europe beyond the Roman frontier—the mysterious North—began to ferment. The Franks showed themselves on the Lower Rhine, the Swabians on the Maine; while the Goths burst through Dacia, routed the forces of Decius (q. v.), and slew the emperor himself at Mount Hæmus, crossed the Euxine, and ravaged the whole northern coast of Asia Minor. A little later—during the reign of Valerian (q. v.), Gallienus, and the so-called *Three Tyrants*—the empire is nothing but a wild distracted chaos, Franks, Alemanni, Goths, and Persians rushing in from their respective quarters like vultures scenting prey. The Goths swept over the whole of Achaia, pillaging and burn-

the most famous cities—Athens, Corinth, Argos, &c.; while the Asiatic hordes of Sapor committed even greater havoc in Syria and Asia Minor; and but for the courage and skill of Odenathus, husband of Zenobia (q. v.), who had built up a strong independent kingdom in the Syrian desert, with Palmyra for its capital, might have permanently possessed themselves of the regions which they merely devastated. With Claudius Gothicus (268–270 A.D.), the fortunes of the empire once more began to brighten. By him, and his successors Aurelian (q. v.), Probus (q. v.), and Carus, the barbarians of the north and north-west, as well as the Persians in the east, were severely chastised. Nay, when Diocletian obtained the purple (284 A.D.), it seemed as if the worst were over, and the empire might still be rescued from destruction; but his division of the empire into East and West, with separate *Augusti* and assistant *Cæsars*—though it sprang from a clear perception of the impossibility of one man administering successfully the affairs of so vast a state—led to those labyrinthine confusions and civil wars, in which figure the names of Maximian (q. v.), Constantius (q. v.), Galerius (q. v.), Maxentius (q. v.), Maximin (q. v.), Licinius (q. v.), and Constantine (q. v.), and which were only brought to a close by the surpassing genius of the last-mentioned. Under Constantine (324–337 A.D.) as all the world knows, occurred the greatest revolution in Roman history since the birth of Christ—viz., the establishment of Christianity as the religion of the state. He also transferred the seat of government from R. to Byzantium on the Bosphorus, where he founded a new city, and named it after himself. But no sooner was the great statesman dead than the mutinous discords that he had kept under by the vigour of his rule, broke loose; the empire underwent a triple division among his sons; and though Constantius (q. v.), the youngest, ere long became sole ruler, he failed to display the genius of his father, and in his repeated campaigns against the Persians reaped nothing but disaster and disgrace. But the political fortunes of the empire now possess only a secondary interest; it is the struggles of the Christian sects and the rise of the Catholic Church that mainly attract the attention of the historian. There, at least, we behold the signs of new life—a zeal, enthusiasm, and inward strength of soul that no barbarian could destroy. Christianity came too late to save the ancient civilisation, but it enabled the Roman world to endure three centuries of utter barbarism, and afterwards to recover a portion of the inheritance of culture that it once seemed to have lost for ever. Julian's attempt to revive paganism was a lamentable anachronism, but his efforts, when governor of Gaul under his kinsman Constantius, to repel the incessant incursions of the Franks and Alemanni, displayed a fine valour and generalship, and were crowned with success. The judgment of the poet Prudentius on the apostate is that of posterity: *Perfidus ille Deo, sed non et perditus orbi*. But after the death of Julian, the signs of the approaching dissolution of the empire became more unmistakable. Yet the great state was, if we may so speak, loath to die; and again and again in her death-agony, she put forth a momentary strength that amazed her foes, and taught them that even the expiring struggles of a giant were to be feared. Valentinian (q. v.), Gratian (q. v.), and Theodosius (q. v.) were rulers worthy of better times. The last-mentioned is even known to history as the 'Great.' But they fought against destiny, and their labour was in vain. Already swarms of ferocious Huns (q. v.) from the east had driven the Goths out of Dacia, where they had

long been settled, and forced them to cross the Danube into the Roman territory, where the cruelty and oppression of the imperial officers goaded the refugees into insurrection; and in their fury, they devastated the whole east from the Adriatic to the Euxine. Theodosius indeed subdued and even disarmed them; but he could not prevent them from drawing nearer to the heart of the empire, and already they are found scattered over all Mesia, Servia, and Northern Illyricum. Hardly was Theodosius dead when they rose again, under their chief, Alaric (q. v.), against Honorius, emperor of the West. R. was saved (for the moment) only by the splendid bravery and skill of Stilicho (q. v.), the imperial general; but after his assassination, the barbarians returned, sacked the city (410 A.D.), and ravaged the peninsula. Three years earlier, hordes of Suevi, Burgundians, Alemanni, Vandals, and Alans burst into Gaul (where the native Celts had long been largely Romanised in language and habits), overran the whole, and then penetrated into Spain, where a Vandal empire was rapidly set up. It is utterly impossible (within our limits) to explain the chaotic imbroglio that followed in the West—the struggles between Visigoths and Vandals in Spain, between Romans and both, between usurpers of the purple and loyal generals in Gaul—the fatal rivalries of those otherwise noble and gifted men—Boniface, governor (*comes*) of Africa, and Ætius, governor of Gaul—which led to the invasion of Africa by Genseric (q. v.), and its devastation from the Straits of Gibraltar to Carthage (429 A.D.). While such was the state of affairs in the West, things were not a whit better in the East. There the Huns, from mere love of havoc, had reduced vast regions to an utter desert; for nearly 50 years, indeed, the little ferocious demons had rioted in destruction. At last, a trivial quarrel sent them into Gaul; but somewhere in Champagne, they were routed with great slaughter (451 A.D.) by a combined force of Visigoths, Burgundians, Franks, and Roman mercenaries, under Ætius and Theodoric, king of the Goths; and in spite of their successful invasion of Italy in the following year, their strength was permanently broken, and henceforth they play an insignificant part in history. But Ætius, the only man who could have decently propped up the wretched ruin, called the Western Empire, was assassinated by his contemptible sovereign Valentinian, whose own outrages led to his murder too; while his widow, Eudoxia, to be revenged on his murderer and successor, Petronius Maximus, invited Genseric, the 'scourge of God,' over from Africa, and exposed R. to the horrors of pillage for 14 days. Ricimer, a Sueve, next figures as a sort of governor of the city, and what relics of empire it still possessed, for Gaul, Britain, Spain, Western Africa, and the islands in the Mediterranean, had all been wrested from it. While Majorian—the last able emperor—lived, Ricimer's position was a subordinate one, but, thenceforth, the western emperor merely was an emperor in name—a *roi fainéant*—while the real sovereignty was exercised by this Suevic *Maire du Palais*, who was succeeded in his functions by the Burgundian King Eadbald, and the latter again by Orestes, in whose time the final catastrophe happened, when Odoacer (q. v.), placing himself at the head of the barbarian mercenaries of the empire, overthrew the last, and the most ridiculous, occupant of the throne of the Cæsars (476 A.D.), who, by a curious coincidence, bore the same name as the mythical founder of the city—Romulus. See, besides the ancient histories of Polybius, Livy, Sallust, Tacitus, &c., the modern histories of Gibbon, Niebuhr, Arnold, Merivale, and Mommsen.

ROME, the capital of ancient Italy, stood on the left bank of the Tiber, about 16 miles from the sea. The legend of its origin belongs to Roman history, and is discussed partly under that heading, and partly in the article ROMULUS. It was built at first in the form of a square (*Roma Quadrata*), and gradually extended, until, in the reign of Servius Tullius, it embraced one after another the famous seven hills—viz., the Palatine, Capitoline, Quirinal, Cælian, Aventine, Viminal, and Esquiline. Servius Tullius (according to the legend) so extended the *pomærium* as to make the sacred enclosure of the city identical with its walls. After its first destruction in 390 B.C. by the Gauls, it was hastily rebuilt without respect to order, and with narrow irregular streets. At the close of the wars against Carthage, Macedonia, and Syria, public buildings and private houses of great architectural beauty were added; and under Augustus, improvements of a similar kind were made, while the mean and narrow streets were allowed to stand. In the reign of Nero, 64 A.D., two-thirds of the city were destroyed by fire, a catastrophe which furnished that emperor with the opportunity of gratifying his architectural predilections, in widening and straightening the streets, and in restricting the height of the houses, of which a certain part was built of fireproof stone from Gabii and Alba. Although it had long outgrown the limits prescribed by Servius Tullius, still the walls of that king marked the extent of R. properly so called down to the 3d c. A.D. Under Aurelian, however, the need of fortifications led to the construction of new walls, which took in the city of Servius Tullius with all the suburbs, such as the Mons Janiculus on the right of the Tiber, and the Pincian on the left. These walls, begun 271 A.D., were completed by the next emperor, Probus, were eleven miles in circumference, and were afterwards restored by Honorius, and partially rebuilt by Belisarius.

Extent and Population of Rome.—Under Servius Tullius, the walls were seven miles in circumference, but the space which they comprised was not entirely occupied by buildings. Under Aurelian, the new walls were 11 miles in circumference, and the city went on extending until it reached a circumference of 13 miles under Vespasian. The population at any given period cannot be exactly determined. According to the *Monumentum Ancyranum*, the *plebs urbana* under Augustus amounted to 320,000; with the addition of women, senators, and knights, the inhabitants must have numbered about 650,000; while the slaves, who cannot have been less numerous than the free population, must have given an aggregate of at least 1,300,000. Considering the enlargement of the city under Vespasian, we may safely set its population down at not less than two millions in his reign.

The Walls and Gates.—The first wall, that attributed to Romulus, embraced merely the Palatine, and was pierced by three gates. The larger wall of Servius Tullius does not appear to have been continuous, but only to have connected the seven hills by fortifications drawn across the narrow valleys intervening. According to Pliny, there were 37 gates in this wall. Subsequent to the walls of Servius were those of Aurelian, which, with the exception of the part beyond the Tiber, are the same as those which surround the modern city. They were divided by 14 gates. The Tiber was crossed by eight bridges.

In the interior of the city were several open spaces of ground, paved with stones, which were used as places of business or as market-places, and were called *fora* (see FORUM.) Besides these, there were other open spaces of much larger extent, which

were grass-grown, and set with trees and works of art. Of these, which were called *campi*, and were used by the people in their exercises and amusements, the chief was the Campus Martius. Surrounding these *fora* and *campi* were the private and public buildings of R., which were arranged in streets and districts. The chief street was the celebrated Via Sacra, remains of which are still to be seen in the Forum of modern Rome.—R. contained no fewer than 400 temples, the oldest being the temple of the Feretrian Jupiter, on the Capitoline, which was built, according to tradition, by Romulus, and restored by Augustus. The most famous in history, and the most magnificent architecture, was the Capitolium, placed on the summit of the Capitoline (see CAPITOL). The only other temple requiring special mention was the Partheon (q.v.), built by Agrippa, 57 B.C. It is still standing.—For other striking features of the ancient city, see CIRCUS, AMPHITHEATRE, BATH, BASILICA.

R. also abounded in covered walks, supported by columns, and open on one side. These were known as *porticus*, and were frequented for the purpose of recreation, or of transaction of business. They were in many cases adorned with paintings and other works of art, and furnished with libraries.—More peculiar to ancient Rome, however, were the triumphal arches. See ARCH, TRIUMPHAL.—The great prison of R. was the Carcer Mamertina, built by Ancus Martius on the slope of the Capitoline, which overhangs the Forum. Servius Tullius added to it a subterranean dungeon, 12 feet underground, walled and arched over with masonry.—In addition to the prisons, we may mention the barracks (*castra*), such as the Castra Prætoria, built by the Emperor Tiberius for the imperial guards; and the Castra Peregrina, where the foreign troops were quartered; the aqueducts (see AQUEDUCT); and the sewers (see CLUACA MAXIMA).

R. also abounded in palaces (*palatia*). Of these, the Palatium, or imperial palace, fronting the Forum, was so enlarged by Augustus, that free being the private house of Hortensius the orator, it became the imperial residence. Nero built still more splendid palaces, one which covered the whole Palatine Hill and part of the Esquiline, and was burned down in the great fire; and one which replaced the other. Many of the private palaces were also on a magnificent scale.—On the hill around the city were laid out *horti*, or parks and gardens, and were adorned with handsome building and works of art.—R. was also rich in secular monuments. See ROMAN ARCHITECTURE.—In addition to these imperial or private mansions, columns were also erected to the more illustrious of the Romans, such as the Columna Rostrata in honour of the consul C. Duilius for his victory over the Carthaginian fleet; the Columna Trajana in the Forum; and the Columna Antonini Pii, in the Campus Martius.—Obelisks (q.v.), mostly transported from Egypt, occupied prominent parts of the city. Since R. has again become the capital of Italy, extensive excavations among the ruins have been carried on upon a systematic plan, and with interesting results.

Modern Rome occupies the plain on each side of the Tiber and the slopes of the seven hills. Its geographical position at the Observatory of the Collegio Romano is lat. 41° 53' 52" N., long. 12° 24' 40" E. of Greenwich, and its height above the level of the sea, on the Tiber, under the Asian Bridge, is 20 feet. Its pop. on 31st Dec. 1871 was 244,400. The members of the religious orders numbered 1867, 7400, including 30 cardinals, 35 bishops &c.

ROME

monks, and 2215 nuns. It contained 4650 Jewish residents, still compelled to inhabit a particular quarter, called the Ghetto. 50,000 persons were then in receipt of public alms.

The city is built on marshy ground, and is divided by the Tiber into two very unequal parts, that on the left bank being R. Proper, and that on the right bank being the Leonine city, or Trastevere. Its walls, 12 miles in circuit, and containing 16 gates, of which 4 are built up, enclose a space of which little more than one-third is inhabited, the greater part to the south of the Capitol being cultivated as gardens or vineyards. The site of the ancient Campus Martius constitutes the lower and most densely populated part of the town, in which all the trade is carried on. Its central part is crossed by the Corso, a street about one mile long, and running from the Piazza del Popolo, or great northern entrance of R., to the Palazzo di Venezia, at the foot of the Capitol. From the Piazza del Popolo, a handsome open space, with an obelisk from the Temple of the Sun at Heliopolis in the middle, branch out to the right and left of the Corso, the Piazza di Spagna, the favourite quarter of foreigners, and the Ripetta. More than half-way up the Corso, and to the right, runs the wide street or Strada del Gesù, leading to the noble church and convent of that name, the chief residence of the order of the Jesuits. On either side of the Corso, the buildings are regular and substantial, and consist of palaces, such as the Borghese, the Ruspoli, the Ghigi, and others, besides many churches. Between the Corso and the Tiber, to the west, the streets are irregular, densely peopled with inferior tradesmen, and consisting mainly of market-places, shops, and dwellings of a low class. In this quarter is the University La Sapienza, between which and the Corso is the Rotunda or Pantheon. South of Ponte Sisto, on the left bank of the Tiber, and winding round the western base of the Capitol to the foot of the Palatine, is the Ghetto, or Jews' Quarter, consisting of narrow dirty alleys, with rows of high old houses. Still further south, and on the left bank of the Tiber, runs a series of narrow streets as far as the Palatine, containing some of the oldest churches in R., such as the Santa Maria in Cosmedin, built in the 3d century. Beyond this extend to the south-east the Aventine, Palatine, and Celian hills, which are covered with gardens, vineyards, and orchards, besides churches, convents, and ruins. At the eastern extremity of the Celian stands the magnificent Basilica of San Giovanni in Laterano. To the south of the Aventine, and between it, the river, and the walls, are the Prati del Popolo Romano, forming part of a large space of low-lying cultivated ground. Near the Prati lies the Protestant Cemetery.

On the slope of the Pincian and Quirinal hills, and covering part of the plateau which joins all the eastern hills of R., lies the upper town, consisting mainly of palaces, villas, churches, convents, and other buildings on a large scale. It abounds with ample courts and gardens, and is crossed by two long streets, which intersect each other at right angles on the crest of the Quirinal. The Pincian is laid out in fine walks, which are the favourite promenade of the Romans; while between the Pincian and the Quirinal stands the great Barberini Palace. On the summit of the Quirinal is the famous pontifical palace and garden; and in the square before the palace are the two colossal statues of Castor and Pollux, with their horses, whence the hill receives its other name of Monte Cavallo. On the Esquiline, which here joins the Quirinal, and forms the eastern extremity of the city, stands the magnificent church of St Maria Maggiore; beyond

it to the north, east, and south, the Esquiline is entirely covered with gardens, villas, and fields, with here and there a church. The principal buildings on the Capitol are three palaces, the work of Michael Angelo, which form three sides of a square, in the centre of which stands the equestrian statue of M. Aurelius Antoninus. One of the palaces is the Capitoline Museum, one of the finest collections of statuary and sculpture in Italy.

The third great division of the modern city lies on the right bank of the river, and is subdivided into two parts—the Vatican (otherwise called Il Borgo) and the Trastevere. Divided from the latter by an inner wall, the Borgo or Leonine city occupies the space between the bridge of St Angelo and the Piazza of St Peter's. Its chief buildings are the palace of the Vatican (q. v.), and the Basilica of St Peter's (q. v.). Besides the Vatican and St Peter's, the Leonine city contains the great hospital of the Santo Spirito, which accommodates annually 13,500 patients, labouring under all diseases, whether mental or bodily. The Castle of St Angelo, with massive circular tower, called from its founder the 'Mole of Hadrian,' is surrounded with ramparts, ditches, and bastions, mounted with cannon, and forms the citadel of Rome.

To the south of the Borgo, and between the Janiculum and the Tiber, is the Trastevere, properly so called. The Janiculum, a straight ridge, about a mile and a half long from north to south, rises about 300 feet above the level of the river. The northern half of its length is occupied by the long street called the Lungara, running closely parallel to the Tiber, which, at the southern extremity of the Lungara, makes a bend to the east, and bounds the greater part of the Trastevere district. On the Janiculum is the Villa Spada, near the gate, outside of which is the Villa Pamfili, a favourite promenade of the Roman youth. On the same hill, the fountain called L'Acqua Paola, the largest in Rome, occupies a commanding site, and, as seen from a distance, resembles a triple triumphal arch, through which streams of water rush.

The churches, of which there are upwards of 300, form a notable feature in R., from their architecture, their paintings, and other decorations. So also are the palaces of the aristocracy, which are often of great magnitude, with vast courts and spacious apartments. Of even better style as residences are the villas, both within and without the walls; while the handsome fountains, of which there are at least 12 principal ones, impart a cheerful and refreshing aspect to the city. There are three modern aqueducts, which keep R. supplied with abundance of water: the Acqua Vergine, the Acqua Felice (the ancient Acqua Marcia and Claudia), and the Acqua Paola (the ancient Alsietina).

R. is, on the whole, a healthy city, except at the close of summer and the beginning of autumn, when the malaria is prevalent. The Trastevere is its most uniformly healthy district, the inhabitants of which are superior in physical development to those of the other parts. The neighbourhoods of the Pincian and the Quirinal, particularly the former, are most frequented by Englishmen. The trade of the city is insignificant, consisting of a few trivial manufactures of hats, silk scarfs, gloves, artificial feathers, false pearls, mosaic trinkets, &c., and of such articles as artists need and visitors fancy. The only great manufacture, if it can be called so, is that of pictures, original and copied; for the painting of these, R. offers not only the advantage of numerous galleries of art, but purity of sky. The worst feature of R. is its dirtiness. In October 1870, R., along with the rest of the Papal territory

was annexed to the kingdom of Italy, and is now the capital. The Pope retains the rights of a sovereign within the Vatican.

ROME, a township and village of New York, U.S., on the Mohawk River, Erie Canal, Black River Canal, and New York Central Railway, 100 miles north-west of Albany. It contains a U.S. arsenal, court-house, jail, academy, 17 churches, 2 newspapers, and numerous manufactories. Pop. (1870) 11,000.

ROMFORD, a market-town in the county of Essex, stands on the river Bourne, or Rom, 12 miles from London, on the Great Eastern line. The annual horse-fair commences on Midsummer Day, and lasts three days. There are extensive breweries of the famous 'Romford ale.' Agricultural implements are largely manufactured. Pop. (1861) 4361.

ROMILLY, SIR SAMUEL, English lawyer and law reformer, born March 1, 1757, was descended from a family of French Protestants, who, after the revocation of the Edict of Nantes, emigrated to England. At the age of 16, R. was articled to Mr Lally, one of the sworn clerks in Chancery; and at 21 he entered himself at Gray's Inn. At first he made little progress in his profession; but after a time he began to apply himself to the study of criminal law; and in 1789, entertaining, like many other English Liberals, a sanguine expectation of the happy effects of the French Revolution, he published a short pamphlet on the subject. In 1792, and again in 1795, he declined Lord Lansdowne's offer of a seat for Calne. In 1806, he was, at the instance of Mr Fox, appointed Solicitor-general in the Grenville administration. He unwillingly received the honour of knighthood; but the king having, for the last twenty years, knighted all his Attorneys and Solicitors-General on their appointment, would take no refusal. He was afterwards returned for Queenborough, was one of the managers of Lord Melville's trial, and passed a bill to amend the bankrupt laws. In 1807, he went out of office, and was elected for Horsham, but being unseated, was returned for Wareham. He now devoted himself to ameliorate the severity of the criminal law, and proposed the abolition of the punishment of death in various cases of theft. He also published a pamphlet *On the Criminal Law as it relates to Capital Punishments*. His bills were, session after session, opposed by the government of the day, the judges, and many of the bishops, as dangerous innovations; but R. nevertheless persevered, and lost no opportunity of protesting against the severity and frequency of capital punishments. The measures he proposed for mitigating the severity of the criminal law were, for the most part, carried by others; but he framed an act for rendering the punishment of high treason less barbarous, and another for taking away corruption of blood, as a consequence of attainder of felony. He took an active part in the anti-slavery agitation, and in opposing the suspension of the Habeas Corpus Act, the spy system, and the despotic acts of the government. In 1818, he was spontaneously chosen by the electors of Westminster as their representative. The death of his wife, following upon prolonged mental exertion, preyed upon his mind, and three days afterwards (November 2, 1818) he died by his own hand. He had at this time attained the foremost rank at the Chancery bar, and his professional gains were said to average £14,000 a year. His death excited profound sympathy, and was considered a public calamity. His *Speeches in Parliament* have been published in two vols.; and his Autobiography, with a selection from his Correspondence, admirably

edited by his sons, has also been published in 2 vols.

—His second son, now BARON ROMILLY, educated at Trinity College, and called to the bar at Gray's Inn, 1827, was made Solicitor-general in 1848, Attorney-general in 1850, Master of the Rolls in 1851, and created a Baron in 1866. As Master of the Rolls he incidentally rendered great services to his country, by superintending the publication of public records, tending to throw much light upon English history and events.

ROMORANTIN, a small town of France, in the dep. of Loir-et-Cher, 25 miles south-east of Blois. At the siege of this town by the Black Prince in 1356, artillery is said to have been first used. Various woollen fabrics are manufactured. Pop. (1872) 6667.

Romp.

ROM'PU, in Heraldry, a term applied to a chevron when the upper part is taken off, and remains above it in the field.

ROMULUS, the mythical founder of the city of Rome. His name is only a lengthened form of Romus, and he is therefore to be regarded rather as a symbolical representation of the Roman people than as an actual individual, like Æolus, Boreas, and Ion, the eponymous ancestors of the Ætolians, Dorians, and Ionians. But though the legend cannot be accepted as history in its details, its outlines, it is nevertheless interesting to know that, after the lapse of years, when Rome had become a place of importance, its inhabitants tried to receive a probable origin for it. We will therefore relate the story of R. as it is usually given. At Alba Longa, in Latium, there had ruled for centuries a line of kings descended from the Trojan prince, Æneas. One of the latest of these, at his death, left the kingdom to his eldest son, Numitor, Amulius, a younger brother of Numitor, who was ambitious, deprived the latter of the sovereignty, murdered his only son, and compelled his daughter, Silvia (generally, but incorrectly, called Rhea Silvia), to become a vestal virgin, thereby hoping to secure immunity for his crime. But Silvia having become the mother of twins by the god Mars, his fears were aroused, and he resolved to drown all the three. A cradle containing the babes was thrown into the Anio, whence it was carried into the Tiber. That stream was then in flood, and had overspread its banks far and wide. The cradle was stranded at the foot of the Palatine, and the infants thus wonderfully saved from death by drowning, were no less wonderfully saved from death by hunger. A she-wolf carried them to her den, near at hand, and suckled them, while a woodpecker brought them whatever other food they wanted. This marvellous spectacle was at length beheld by Faustulus, the king's shepherd, who took the infants home to his wife, Acca Larentia, who had them brought up with his own children. A strife having one day arisen between them and the herdsmen of Numitor, who stalled their cattle on the Aventine, Remus, one of the twins, was taken prisoner, and carried off to Numitor. When the latter looked on the youth, he could not but think of his grandsons; and the story of the miraculous preservation of the twins, strengthened the suspicions that were beginning to form in his mind. R. now made his appearance, accompanied by his foster-father; an *éclaircissement* took place. Numitor acknowledged the boys as the sons of his daughter Silvia, and they immediately proceeded to avenge the family wrongs, by slaying Amulius and placing their grandfather on the throne. But

continues the legend, R. and his brother did not care to remain in Alba Longa; they loved their old abode on the banks of the Tiber, and resolved to build a city there. The Palatine was chosen (by augury) for the site, and R., yoking a bullock and a heifer to a ploughshare, marked out the *pomarium*, or boundary, on which he proceeded to build a wall. Remus laughed at the idea of keeping off enemies by such means, and to shew its inefficiency, scornfully leaped over it, whereupon R. slew him, but was immediately struck with remorse, and could obtain no rest till he had appeased the shade of his brother by instituting the *Lenuria*, or festival for the souls of the departed. The next thing which R. did was to erect a 'sanctuary' on the Capitoline for runaway slaves and homicides, and by this means he soon increased the number of his followers; but as wives were much wanted, R. tried to obtain them legally from the neighbouring states. His efforts, however, failed: a 'runaway slave' not being considered a desirable match for his daughter by a Latin or Sabine paterfamilias, and he was compelled to have recourse to stratagem. This led to the celebrated *Rape of the Sabine Women*, the incidents of which are too familiar to require narration. The consequence of this wholesale abduction of virgins was a series of wars, in which, however, R. was invariably victorious, until Titus Tatius, at the head of a large army of Sabines, drove him from the open fields, and forced him to take refuge in his city on the Palatine. R. had also garrisoned the Capitoline, but the treachery of Tarpeia, a daughter of the lieutenant of the fort, placed it in the hands of his adversaries. Next day, a battle took place in the valley between the two hills. It was long and fiercely contested. Sabines and Romans fought till they were exhausted, when the Sabine women rushed in between their husbands and fathers, and implored them to be reconciled. This was agreed to, and henceforth they resolved to unite, and to form only one people—the followers of R. dwelling on the Palatine, those of Titus Tatius on the Capitoline and Quirinal. On the death of Titus Tatius, who was murdered at a festival held at Lavinium, R. became sole sovereign, and subsequently—according to a later legend—made successful war against the Etruscan cities of Fidenæ and Veii. The political organisation of the Roman *populus* ascribed to R. is given under ROMÆ. After a reign of 37 years, R. was miraculously removed from earth. While he was standing near the 'Goat's Path' in the Campus Martius, reviewing his militia, the sun was eclipsed, and a dark storm swept over the plain and hills. When it had passed, the people looked round for their king, but he was gone. His father, Mars, had carried him up to heaven (like the prophet Elijah) in a chariot of fire. Some time after, he reappeared in a glorified form to Proculus Julius, announced the future glory of the Roman people, and told him that henceforth he would watch over them as their guardian god, under the name of Quirinus. The festival of the Quirinalia (17th February) was instituted in his honour; but the nones of Quintilis (7th July) was the day on which he was believed to have departed from earth.

ROMULUS AUGUSTULUS. See ODOACER.

RONALDSHAY, NORTH AND SOUTH, two of the Orkney Islands (q. v.). North R., situated at the north extremity of the Orkneys, has an area of 4 sq. miles. It is partly under tillage, and partly in pasture. Sea-birds in great variety frequent the coast, and lobsters and cod are fished. Pop. (1871) 221.—South R., washed on the south by the Pentland Firth, has an area of about 18 sq. miles. St

Margaret's Hope, on the north coast, is a safe and convenient harbour. The inhabitants derive their subsistence for the most part from fishing for cod and herrings. Pop. (1871) 2501.

RONCESVALLES, one of the valleys in Navarre, on the southern side of the Pyrenees, about 20 miles north-north-east of Pamplona, has been rendered famous in poem and story as the scene of a defeat sustained by the army of Charlemagne at the hands of a combined force of Arabs, Navarrese, and French Gascons in 778. Charlemagne, allured by the promise of the feudal supremacy of Catalonia, opened a campaign in aid of the viceroy of that province against the Mohammedans. With a powerful army he passed the Pyrenees, penetrated into Navarre, took Pamplona, the capital, and levelled the walls of the city with the ground. Clearly this was not part of his programme as the champion of the Christian religion in Spain; for Pamplona was the capital of a Christian state, and it is even asserted that prior to 870 A.D. Moors had not been admitted within its walls. Pressing onward, Charlemagne subdued a great part of the country between the Pyrenees and the Ebro; but on his return northward, while threading the defiles of the mountains near R., his rear-guard was furiously assailed and annihilated by a mixed force, of which a body of Navarrese, enraged at the destruction of their capital, formed an important section. Eginhard, the secretary of the emperor, tells us that the whole rear-guard, including many generals and chief nobles, was totally destroyed, and that the spoil of the campaign, together with the whole baggage of the army, fell into the hands of the victors. In this action fell Roland (q. v.), the famous Paladin, and the hero of a hundred romances. The older poets found abundant material in the battle of R., in which, on the one side, ranked the most distinguished chivalry of that time, and on the other the patriotic, high-spirited, mountaineers of Navarre; and in recent times the incident has contributed a spirited allusion to Sir Walter Scott's *Marmion*:

'Oh, for a blast of that dread horn,
On Fontarabian echoes borne,
That to King Charles did come,
When Roland brave, and Olivier,
And every paladin and peer,
On Roncesvalles died!'

RONCIGLIO'NE, a city of Central Italy, in the province of Viterbo, and 12 miles south-south-east of the city of that name. Pop. 5159. It has a fine cathedral, a Gothic castle, and several fine old palaces. Hats, cloth, and cotton goods, are manufactured, and iron, brass, and copper works are in operation. In the neighbourhood of the city there are sepulchral vaults, hollowed out in the porous rock (*tufa*), and several sulphureous springs.

RONDA, a picturesque Moorish town of Spain, in the modern province of Malaga, on the Guadiaro, 50 miles north-north-east of Gibraltar. Situated at a considerable elevation, the climate of R. is unusually salubrious, and the town is a favourite summer retreat for the wealthy of Seville, Ecija, and Malaga. The great annual fair takes place in May, at which time R., its bulls and braves, are seen to the greatest advantage. On such occasions, the small but active horses of the town are sold in large numbers to officers from Gibraltar; and leather, saddlery, embroidered gaiters, garters, and mantas, are also sold. Pop. 23,500.

RONDO (Ital.), or RONDEAU (Fr.), originally a little poem of 13 lines, divided into three unequal strophes; the two or three first words of the first line serve as the burden, and recur after the 8th and 13th line. Thence, in music, the term has come

to denote a light air, consisting of three or more strains, the first terminating in the original key, and each of the others so constructed as to conduct the ear back to a repetition of the first strain. In a more general sense, the name rondo is also often applied to any light lively tune which ends with the first strain repeated.

RONGE, JOHANN. See GERMAN CATHOLICS.

RONCARD, PIERRE DE, a celebrated French poet and reformer of French poetry, was born at the Château de la Poissonnière, in Vendômois, September 11, 1524. At the age of nine, he was sent to the Collège de Navarre, but was soon removed, and shortly after entered the service of the Dauphin as page. Handsome, well-made, and excelling in all bodily accomplishments, he soon became a general favourite. When his master died (1536), he became attached to the household of the Duc d'Orléans, second son of the king, accompanied James V. of Scotland back to his kingdom, with his new bride, Marie de Lorraine, in 1538; and after a stay of nearly three years at the Scottish, and six months at the English court, he returned to France, and re-entered the service of the duke. A little later, however, on recovering from a serious illness, he found himself afflicted with a deafness, which led him to resign the pursuits of arms for those of letters. With this view, he took up his residence in the Collège de Coqueret, and studied hard for five years. He had previously acquired a knowledge of Latin and of several European languages. His own language, as a vehicle of literary instruction, was a subject of continual meditation with him. Familiar now with the masterpieces of Greece and Rome, he wished (like a true child of the Renaissance, as he was) to invest the national poetry with a classic dignity and grace. Several of his fellow-students shared his opinions and enthusiasm; and in 1549, one of these, Joachim du Bellay, published what may be called the first manifesto of the new school, the *Illustration de la Langue Francoise*. Without denying the necessity or the value of the change thus begun by R. and his friends, we may just remark in passing that the most intelligent French critics now admit that it was too radical, too absolute: it broke abruptly with the national traditions and tendencies, and more than anything else helped to fix that pseudo-classicism of style which was subsequently brought to disastrous perfection in the *splendida via* of Corneille and Racine. In 1550, R. himself appeared in the field with his *Amours* and *Quatre Livres d'Odes*. The volume excited the most violent opposition among the adherents of the older national school, and it cannot be said that their antipathy was altogether unreasonable. Rabelais (q. v.) was conspicuous among the adversaries of the new school, and made R. the subject of some bitter sarcasms. But on the whole, the classic party had the best of it. Its efforts were in harmony with the general intellectual tendencies of the time, and, besides, R. was just the man to make powerful friends. Marguerite, sister of Henry II., granted him a pension; the illustrious Chancellor De l'Hôpital warmly encouraged him to persevere in his course; and both Henry II. and François II. covered him with honours and pensions. In 1553, a new edition of the *Amours* was published; in 1555, the first, in 1556, the second, volume of his *Hymnes*; and finally, in 1560, an edition of his whole works up to this period, in four volumes. The admiration of his contemporaries intoxicated him; and he did not shrink from conferring on himself a sort of anticipatory apotheosis. During the religious wars that devastated France, R. made himself noted by the

violence of his attacks on the Calvinists or Huguenots. Twenty days after the massacre of St. Bartholomew, he published *La Franciade*, an epic fragment. He meant that it should comprise 14 books, but he only finished 4, having, perhaps, discovered that the subject was not happily chosen, and that epic poetry was a touch above him; yet such was the belief in his genius, that not a few of his contemporaries did not hesitate to prefer it to the *Aeneid*. Charles IX. could only express his delight by conferring on the lucky bard additional favours. He gave R. the abbey of Croix-Val and Bellozane, and the priories of Saint-Comme, d'Evailles, &c. But the 'disorders' of what his countrymen call his 'joyous' youth, now began to tell upon him, and, afflicted with premature infirmities, he retired to the abbey of Croix-Val, where he spent most of his remaining years in lettered ease, honoured with the attentions of the great to the last. Queen Elizabeth of England sent him a set of diamonds, and Mary Stewart, from her prison, a set of plate worth 2000 crowns, with the inscription:

A' Ronsard, l'Apollon de la Source des Muses.

In 1584, he collected and republished his works in one volume, and died on December 27, the year following.—See Saint-Beuve's *Choix de P. Ronsard, avec Notice, Notes et Commentaires* (Paris, 1828).

ROOD, a measure of surface, the fourth part of an acre, and containing 40 square poles or perches. It is quite different from the rood used in estimating mason-work, for which see ROD.

ROOD (Anglo-Sax. *rod*, a cross), a figure of the cross, and generally of the crucifix. The word is also applied to the actual cross on which our Lord suffered, although, when used to signify the real of the true cross, it is commonly found with the prefix Holy, from which Holyrood at Edinburgh derives its name; but in its most ordinary signification it is applied to the large and stately crucifix which was placed at the entrance of the chancel in most medieval churches. On either side of the cross most commonly were placed figures of the Blessed Virgin and St. John, in allusion to the xix. 26. The manner of placing the rood differs in different churches; most commonly it stood in a gallery or screen at the entrance of the chancel, which was called the ROOD-LOFT or Rood-screen. In England, after the Reformation, the rood-screen was, as a rule, removed from all churches; but in a few country churches it still remains in a more or less perfect form. A very perfect specimen of the rood is in the great church of Louvain.

ROOF. The coverings of houses vary in every climate and every age. In warm countries, such as India, flat roofs, covered with cement, are almost invariably used. The frequent allusions in the Bible to the house-top shew that the roofs of Palestine were flat in ancient times as they are now. The roofs of Egypt and Assyria (q. v.) were also flat, and composed of wooden beams, covered with thick layers of earth, forming an impenetrable protection from the fierce heat of the sun. In countries where the climate is milder, and rain more abundant, roofs sloping from a central ridge are the usual form. The Greeks and Romans constructed their roofs in this way. Those of Greece were, in important works, covered with marble slabs, carefully grooved together, so as most effectually to protect the interior from rain. In the common buildings of Greece and Rome, roofing-tiles are used.

In the rainy climate north of the Alps, roofs of a much steeper pitch are employed, so as the rain

ROOF.

readily to throw off rain and snow. The angle at the ridge is not uncommonly a right angle; and roofs slated in the usual way should never be less than $\frac{1}{4}$ of the span (or width between supports) in height. When large slates are used, $\frac{1}{4}$ of the span in height will suffice.

When roofs are well constructed, they serve to bind the walls together, and thus to strengthen the building. In order to do this effectually, they must not be made of too great weight, otherwise they crush the walls. The actual covering of the roof and its supports are therefore made as light as possible, and the strength concentrated in principals or trusses. The following are the commonest forms of these

Fig. 1.

trusses: Fig. 1 represents what is called a king-post roof (A being the king-post), and fig. 2 a queen-post roof (B, B being the queen-posts). The latter is

Fig. 2.

used for wider spans than the former, and has the advantage of leaving the centre of the roof clear of timbers, so that attic rooms may be introduced. The other members of the truss are named as follows: C, C, C, C, braces or struts; D, D, tie-beams; E, E, E, E, principal rafters; F, F, ridge-pieces; G, G, &c. purlins; these and the ridge-piece are laid across from truss to truss, and carry the common rafters, J, J. H is a collar. K, K the pole-plates, and L, L the wall-plates, are laid along at the wall-head, to bind the wall and feet of rafters together.

The above system of construction has been used from a very early time to the present day. The early Christian, and probably the Roman basilicas, had exactly such roofs. In early Gothic times, roofs of this kind were made ornamental by carving the king-post, and moulding the tie-beam. During the Decorated style, an arch, or a series of cants (A, A) was introduced, as shewn in figs. 3, 4, and 5. As the style progressed, curved braces were placed

Fig. 3.

under the tie-beam, to support it; these were carved, and rested on elegant corbels, the spandrels between the braces and the wall being filled with tracery. In the Perpendicular style, the central part of the tie-beam is cut away, and the beautiful Hammer-beam (q. v.) roofs of the period become usual (see fig. 6.) The roof of Westminster Hall is one of the finest examples of this kind of roof. These open timber-roofs are used both in churches and halls, but chiefly in the latter, as the church roofs were frequently vaulted.

Fig. 4.

Fig. 5.

See VAULTING. In modern times, when great spans have to be roofed over, combinations similar to

Fig. 6.

those used in Lattice Bridges (q. v.) are required. Recently, iron has been introduced, and by means

of it, spaces of almost any width can be roofed over.

ROOK (*Corvus frugilegus*), a species of Crow (q. v.), very common in the southern parts of Britain, and found in many parts of Europe and Asia, even to Japan; about the same size with the common or carrion crow, but easily distinguished from it, even at a distance, by its colour, which is a glossy, deep-blue black, in certain aspects grayish. On a nearer view, a more notable distinction is found in the naked warty skin at the base of the bill, extending back rather beyond the eyes, and pretty far down on the throat. Still more different are the habits of the birds, the common crow frequenting lonely situations, and preying much on carrion; the R. choosing rather the neighbourhood of human habitations, and seeking its food, both animal and vegetable, chiefly in cultivated fields. Moreover, whilst the common crow is solitary, the R. is gregarious; and very large companies often assemble in *rookeries*, making their nests in close proximity, generally in tall trees, the same tree often sustaining many nests. So far are they from disliking the companionship of man, that it is not uncommon for rooks to build their nests in the trees which grow in the midst of great cities. A tree even in Cheapside has been occupied by rooks' nests. Few cities or large towns in Britain are without rookeries, sometimes of considerable magnitude. The smoke seems to be disregarded by the birds. The R. is nowhere more abundant than in England and the south of Scotland, but it becomes rare in the northern parts of Scotland, and is not to be seen in Orkney and Shetland; probably, however, not on account of climate, but from want of trees. Sometimes, indeed, rooks have been known to make their nests in steeples, vanes, &c., but rarely. They have been observed to avoid with peculiar caution trees which are decaying and likely soon to be blown over—perhaps, however, on account of the state of their twigs—and trees that are marked on the trunk for cutting down. They are notable for the care with which they guard against the approach of danger, when they are feeding in fields, a few solitary rooks perched on trees, palings, or the like, being ready to give the *caw* of alarm to the often very numerous flock. They are also notable for their dread of a gun, the danger of which they seem to know; so that a man without a gun may approach them much more nearly than a man who carries a gun, and even a stick lifted up is apt to excite their alarm. It is also commonly believed in some districts that they know Sunday, and are less timid of the approach of man on that day than on other days of the week. A gig or carriage may approach them much more nearly than a man on foot, and they are very indifferent about the passage of a railway train. It is interesting also to observe how soon they become familiarly acquainted with scarecrows. The nests of rooks are formed of twigs, lined with grass and fibrous roots; generally containing four or five eggs, of a pale greenish colour, blotched with dark greenish-brown. During the nest-making time, rooks rob each other in a remarkable manner, and prodigious quarrels arise in rookeries on this account. Any pair attempting to found a separate colony on a tree far apart, are apt to be assailed by the whole force of the rookery, and the nest pulled to pieces, its materials of course being carried off.

Rookeries are sometimes of great size, and immense flocks of rooks are often to be seen feeding together in fields, or darkening the sky in their outward or homeward flight. Farmers very often complain of them for rooting up grass and young corn, and for injury to young potatoes, turnips, &c.; but on the other hand, it is urged that they are

of very great use by eating up wire-worms, cock chafer grubs, and other insect larvæ, slugs, &c., and that the grass pulled by them is very good, that of which larvæ have already devoured the roots. The truth appears to be that rooks in moderate numbers are very useful; but that it is possible to protect them too much, until their multitudes become a nuisance in a neighbourhood, the insufficient quantity of their favourite food compelling them to other resources not so agreeable to the farmer; and at least in such circumstances they certainly devour large quantities of grain.

It has been supposed that the naked space at the base of the bill of the R. is in consequence of its habit of digging in the ground, and in support of this view it is urged that this space is feathered in the young bird; but it is found to become naked even in rooks caged from the beginning of their life, and there are numerous other arguments against the supposition. The naked space must be regarded as a natural peculiarity of the species.

The same rooks seem to take possession of the old nests year after year, repairing them, and building new ones. The time of building and repairing nests is one of prodigious clamour in the rookery, and begins early in spring. The male feeds the female assiduously during incubation, and sometimes takes her place on the nest. Both parents bring food to their young ones.

The R. is capable of being tamed, and tame rooks have been known to exhibit something of the imitative power of voice possessed by several other birds of the same family.

White, cream-coloured, and pied rooks are now and then seen. These peculiarities of plumage probably arise from a more or less diseased condition.

ROOKERIES, in Law. Though rooks are encouraged to breed in and to frequent the trees of an estate, yet they are not protected in any way by laws resembling the Game Laws, which inflict penalties for illegally trespassing to take or kill them. The rooks, while frequenting the rookery, whether it is an ancient or a newly-made rookery, are in the ordinary category of wild animals, and the owner of the estate or ground where the trees grow has no more property in them than any other person. The owner of a rookery once brought an action against a neighbour for shooting at the rooks as they were flying over the neighbour's estate towards the rookery; but the English courts held that no such action was maintainable, for every person may shoot and catch a wild animal upon his own lands, if he pleases. The law is the same in Ireland and Scotland. No person can be put into custody, or fined, or punished by justices of the peace for trespassing in order to shoot at rooks; nevertheless, the owner or occupier of the ground trespassed upon may bring an action of damages against the trespasser.

ROOKE, SIR GEORGE, a distinguished British admiral, was born in the year 1650, near Canterbury, at the country-seat of his father, Sir William Rooke. Having entered the navy, he found himself at the age of 30, a post-captain; and in 1689 he was promoted to the rank of rear-admiral. He was engaged in the action off Beachy Head between the Earl of Torrington and the French admiral De Tourville; and in 1692, he took part in the memorable battle of La Hogue, fought between the French fleet and the combined English and Dutch force under Admiral Russell. On this occasion his services were of the most brilliant and distinguished character, and in acknowledgment of them he received the rank of vice-admiral of the red, the honour of knighthood, and a pension of £1000 a year.

His next important service was the destruction of a Spanish plate-fleet in the port of Vigo; and in July 1704, in conjunction with Sir Cloudealey Shovel, he accomplished the capture of Gibraltar. Such was the vigour of the operations, that a single week sufficed for the reduction of a fortress, which, as having defied the most formidable, elaborate, and prolonged attack, has since been reputed impregnable. On the 9th August of the same year, he engaged off Malaga a French fleet of much superior force, under the Comte de Toulouse, and fought one of the bloodiest of our naval battles, the honours of which fairly remained with the English, though the escape of the enemy's force rendered it by comparison a barren triumph. The struggle lasted through nearly a whole day; the French loss was upwards of 3000, the English upwards of 2000 men. On the return of Sir George to England, he was received with marked distinction by Queen Anne; but finding the hostility of the Government directed against him on the merely partisan ground of his having previously, as member for Portsmouth, allied himself with the opposition, he resigned his employments, and along with them his seat in parliament; and till his death, which took place on the 24th January 1709, led the life of a quiet country gentleman on the family property in Kent. He was thrice married, and left behind him one son by his second wife.

ROOT, in Botany, sometimes designated the *diverging axis* of a plant, that part by which it is tied to the soil and derives nourishment from the soil. The root is developed in the germination of the seed, at or about the same time with the stem, and forces its way downwards as the stem grows upwards. The root differs from the stem in the irregularity of its ramifications, in the want of a central pith, in the want of buds, in the want of scales or of scars to indicate their former presence, and in the want of stomata. The axis of the root giving off branches, these finally subdivide into *fibres*, which are little bundles of annular ducts, or sometimes of spiral vessels encased in woody fibre, and covered with a lax cellular integument. The apex of each fibril is sometimes called the *spongiole*: it consists of extremely lax cellular tissue, and has the property of absorbing fluids with great rapidity, thus subserving the nourishment of the plant. See *EMBRYONAL*.—Aerial roots occur in some plants, as in some *Epiphytes*, the Banyan, Mangroves, &c.; by which nourishment is derived from the air, in addition to that obtained through the leaves and bark, or by which the branches seek to connect themselves anew with the ground, for support and nourishment; and many plants, as Willows, produce adventitious roots very readily, when any portion of the stem or branch is imbedded in moist soil, of which advantage is taken for their artificial propagation.—The central axis of many roots goes deep into the ground in a tapering manner, forming what is called a *tap-root*; other roots have the descending axis very short, and are called *fibrous*. The roots of some plants spread very widely; those of others occupy a very limited space. The roots of coniferous trees and palms are very small when compared with the appearance of the tree above ground.—Tap roots sometimes assume a conical form, as in the carrot; others are variously developed in thickness at the upper part, as in the turnip and radish. **TUBERS** (q. v.), **BULBS** (q. v.) and **CORMS** (q. v.) are peculiar developments, evidently intended to secure a store of nourishment for the plant, but which also are very frequently available for the use of man.—Exulcent roots are numerous, and many roots also contain secretions either peculiar to themselves, or more abundant than in the other parts of the plant,

and become therefore useful in medicine or in the arts, while some are very poisonous. The roots used for food, besides the tubers, bulbs, and corms above mentioned, are generally those which are thick and fleshy. The plants to which they belong are of very different genera and orders—some of the natural order *Cruciferae*, as the Turnip and others of the genus *Brassica*—some of the order *Chenopodiaceae*, as Beet and Mangold Wurzel—some of the order *Umbelliferae*, as the Carrot, Parsnip, &c.—some of the order *Leguminosae*, as the *Pachyrhizos angulatus*, which is cultivated in all parts of the East Indies, and *P. trilobus*, which is cultivated in Cochin China. In many of the lower classes of plants, particularly the *Algae*, there is no root whatever, although the plant is often attached by a base.

ROOT, in Philology, is that part which is common to a group of allied words—the germ out of which they have all sprung. It is arrived at by taking away the formative parts—the suffixes and affixes, and reversing any change that their presence may have caused. Thus, in co-in-cid-ence, the root-syllable is *cid*, the primary form of which in Lat. is *cad*, to fall. It is seldom that this analysis can be successfully performed with only one language; in order to get at the true root, the corresponding words in all the languages of the same family must be compared. Thus, in the Eng. words *story*, *history*, *historical*, *historically*, *histor* would seem to be the root; but by comparing the Greek with the Lat. and Sanscrit, we arrive at a syllable *vid*, meaning to see or know, of which the Eng. (to) *wit* (wist) is only another form. And even then we are not sure that we have arrived at the original and most simple form. Thus, Eng. *yoke*, Lat. *jugum*, come from the syllable *jug*, to join, seen in Lat. *ju(n)go*, Gr. *zeugo*; and this might be rested in as the root, were there not a simpler form, *ju*, preserved in Sans., and having the meaning of mingling or being together; this, which may be taken as the primary root, gives rise to the two secondary roots or modifications, *jug*, to join, and *yudh*, to fight (i. e., to join battle).

The roots of the Aryan languages are always monosyllabic, as *i*, to go; *ga*, to go; *ad*, to eat; *vak*, to speak; *star*, to strew. They are divisible into two classes, the one expressing some action or general property, as in the instances now given; the other indicating relative position, as *ma*, here or me; *ta*, there or that. The one class are called *predicative* roots; the other, *pronominal* (see *PRONOUN*, *PREPOSITION*). They all expressed primarily some physical notion or relation palpable to the senses; but from these the transition to the impalpable conceptions of the mind is natural and obvious; thus, *vid*, to see, served also for to know. The notion expressed by a root-word is always of a very general kind; but by a variety of expedients, such as lengthening the vowel, reduplication of the syllable, prefixing and affixing letters and syllables (many of which at least are evidently pronominal roots), and composition with other predicative roots, one germ gives rise to a whole group of words expressive of the specific applications of the generic idea. Thus, from the root *spac* or *spec* (in Gr. *skepe*), to look, have sprung a numerous family of words in the English and other kindred tongues; *spy*, *despise* (to look down upon), *spite* (through Fr. *despit*), *respite*, *respectable*, *suspicion*, *prospect*, *inspect*, *auspices*, *speculum*, *species* (i. e., the appearance or individual form, as opposed to the kind or genus), *spices*, &c.

Roots, in the Aryan languages, never enter into speech in their pure and simple form; to make them words, they almost always take on the addition of a pronominal element. Thus, the reduplicate root *da-da*, having the sense of giving, becomes, by the

addition of *mi*, *my*, the word *da-da-mi*, I give; *vak*, to speak, by affixing *s* (for *sa*, that), becomes *vaks*, in Lat. *vox* (*voice*), voice (i. e., that speaking). See INFLECTION.

It requires but a few germs to produce, by the processes above described, the most copious vocabulary. The 50,000 words of the Chinese dictionary are formed from 450 roots; those of Hebrew and of Sanscrit are reckoned at about 500; and there are probably not many more in English (see Max Müller's *Lectures*, 1st series, p. 252). The theories as to the origin of the roots themselves, and why a particular thing or notion should have become associated with a particular sound more than with any other, are noticed under PHILOLOGY and ONOMATOPEIA.

ROOT, in Algebra, denotes any value of the unknown quantity in an equation, which will render both sides of it identical. See EQUATION, INDETERMINATE PROBLEMS, IRREDUCIBLE CASE, &c. The determination of the roots of equations, either formally or actually, constitutes the greater portion of the science of Algebra, while the approximation to roots of those equations whose degree is still beyond a general solution (4th and upwards) forms almost a separate branch of itself. Roots are divided into various classes; they are *real* when they consist of numerical quantities positive or negative; and *imaginary* when they assume the form $a + b\sqrt{-1}$.

ROOT-MILDEW, a name given, not to any well-determined species of fungus, but to certain *mycelia*, which infest the roots of peaches, apples, roses, currants, &c., and cause their death. The tree or shrub is often very suddenly cut down, from apparently perfect health. The roots are found more or less decayed, and covered with filmy white threads. The *mycelium* is supposed to belong to species of *Polyporus*. In some plants, as roses, the state of the bark just above the soil is believed to be premonitory of the disease, which may perhaps then be arrested by washing with a solution of corrosive sublimate. But the *mycelium* is not easily destroyed, and a tree of the same kind should not be planted where it has proved fatal.

ROOT-PARASITES, plants which grow upon, and derive their nourishment from, the roots of other plants. Such are the Broom-ropes (*Orobanchææ*, q. v.), species of *Thesium*, &c., and the *Rafflesias* (q. v.), with other *Rhizanthææ* (q. v.).

ROOT-STOCK, or RHIZOME (*Rhizoma*), in Botany, a stem running along the surface of the ground, partially covered with soil; sending out roots from its lower side, and leaf-buds from its upper. The common yellow iris affords a very perfect example of it. Many ferns have root-stocks. The root-stock is often regarded as a creeping root; it is really, however, not a root, but a stem.

ROPE AND ROPE-MAKING. Ropes are usually made of vegetable fibres, and differ only from twine in their much greater thickness. The fibre most commonly used in Britain is hemp; but large quantities of plantain fibre, called *manilla* hemp, made from the leaf-stalks of *Musa textilis*, are also employed, especially for the large ropes used for various purposes on board ships. Ropes consist of many thicknesses of yarn, which is spun by hand in places called rope-walks. The spinner has a large bundle of the fibre loosely gathered round his waist, from which he pulls out a few fibres, and attaches them to a hook in the turning wheel or whirl, which is stationary, and is worked by an assistant. Experience teaches him what number of fibres to draw out, and how to twist them so as to

hold firmly on to the hook. He then walks slowly backward down the rope-ground, gradually drawing out or regulating the pulling out of the fibres so as to make an equal yarn, which receives the necessary twist from the whirl. When he has got to the end of the walk, another spinner takes the yarn from the hook of the whirl, and fixes it to a reel, which is then set in motion; and he attaches a second portion of hemp from his own supply to the hook, and proceeds down the walk as the previous one had done. In the meantime, the first spinner gradually walks up the ground, carefully guiding his length of yarn as it is wound on the reel. When he reaches the reel, it stops, and he waits until the second spinner's length is completed. He then in his turn takes it off the hook, and twists it on to his own; and the reel being again started, receives the additional length from the second man, and so on until the full length required is made up. The next operation is called *warping*, and consists in stretching out the number of yarns required for a rope. These are slightly twisted again separately, and stretched to an equal length. Then, if they are intended for tarred ropes, each yarn is drawn separately, either lengthwise or in a hank, through a kettle of tar. The superfluous tar is removed by drawing through a hole lined with oakum. In the next process, called *laying*, two or more yarns are attached to hooks on a whirl, so that when it is turned they will be twisted together the contrary way of the original twist they received in the first spinning. When this is done, it is called a strand. These many of these strands as are required for the rope are stretched at full length, and are attached at one end to whirls. One of the whirls has but one hook to which all the strands are attached; the other has as many hooks as there are strands, one always being central, and a strand is attached to each. The whirls are then put in motion, but in opposite directions, and this causes the outer strands to be laid with great regularity and firmness around the central one. Such is the ordinary process of rope-making; but machines have been invented which produce ropes with such mathematical precision that the strength of the rope may be calculated with great exactness. Captain Huddart has the merit of introducing these improvements; and very few applications of mechanism are more beautiful in their design than those which he has worked out. They, however, do not alter the principle of the manufacture. Within the last two years a great improvement has been patented by Mr Edward Sang of Edinburgh, and is now in profitable use in the establishment of the Edinburgh and Leith Rope Company. It consists of a machine which draws the yarn from material supplied as before by the spinner, but it does away with the long walk, and can be used in a small room.

Large ropes are either what is called *cable-laid* or *hawser-laid*. The former consist of three large strands, each made up of three smaller strands. A cable-laid rope of eight inches' circumference is made up in this way of nine strands, each containing thirty-seven original yarns, or altogether 333 yarns. A hawser-laid rope consists of nine three strands, each containing a sufficient number of yarns to make up the required thickness. The numerous lives and the vast property dependent on the efficiency of ropes employed in shipping have caused a great amount of ingenuity and care to be brought to bear on the manufacture. One of the great improvements of modern times has been the introduction of wire-ropes, which are now extensively used in rigging ships, and for other purposes. They are generally made of iron wire, sometimes of steel, but not always galvanised. The twisting is effected

in the same way as that in which the strands of a hempen rope are laid together.

ROQUE, St., a popular saint of the Roman Catholic Church in France, who is especially considered the patron of those sick of the plague. Of his history, nevertheless, few particulars have been preserved. He was born of a noble family in Montpellier, early in the 14th, or at the end of the 13th c.; and having undertaken a pilgrimage to Rome, was surprised, upon his way through Italy, by an outbreak of the plague at Piacenza, where he devoted himself with generous zeal to the care of the victims of this pestilence. Falling sick of the plague himself, and abandoned by man, he contrived to drag himself to a neighbouring wood, where a dog used to lick his sores; and it pleased God to restore him to health. He returned to France; and after a life of great sanctity, died at Montpellier, probably in 1327.

ROREE, BORI, or LOHRI, a decayed town of Sind, stands on a picturesque rocky eminence, on the east bank of the Indus, in lat. 27° 38' N. Steamers ply to and from Hyderabad. Cotton and silk fabrics, gold and silver wares, paper, and leather, are manufactured. Pop. about 8000.

RO'RQUAL (*Rorqualus*, *Balenoptera*, or *Physalus*), a genus of Cetacea of the same family (*Balenidae*) to which the Greenland whale belongs, and distinguished by having a dorsal fin, which, however, is not large in comparison with the size of the animal, and is pointed, the point directed backward; and also by the form of the head, which, instead of having the upper jaw much arched, as in the Greenland whale, has it in the skeleton nearly straight, the plates of baleen or whalebone being therefore much shorter, whilst along the throat and belly are many longitudinal folds, allowing of the distention of the integuments so as to form a great pouch for the reception of water and prey, to be afterwards sifted by the plates of baleen. For a long time these folds of the throat and belly were a puzzle to naturalists, but their use seems now to be thoroughly ascertained. The form is more elongated than in the Greenland whale, and as the girth of the largest rorquals has been found equal to that of the largest Greenland whales, the rorquals appear to be the largest of the Cetacea, and indeed of all animals at present existing in the

the former; and a smaller one, said not to exceed 25 feet in length, and known as the *Pike Whale*, from the resemblance of the mouth to that of a pike, being assigned to the latter. Other naturalists of no mean reputation doubt if the Pike Whale (*Balenoptera rostrata*, or *B. musculus*) is anything else than the young of the Great Northern R. (*R. Boops*), the *Fin-fish* or *Razor-back* of whalers. The question was supposed to have been determined by Mr F. Knox of Edinburgh, who found the number of vertebrae to be different in specimens cast upon the Scottish shores; but the number of vertebrae has been found so different in other specimens examined, that either this must be a comparatively unimportant character, or the number of species must be greater than has been supposed. The northern R. is of a slate-gray colour, whitish beneath. It is found in the arctic seas, visiting also those of the northern temperate regions, and is not very unfrequent on the coasts of Britain. When it comes to the surface of the water to blow, it does not lie motionless, as the Greenland whale usually does, but swims at the rate of about five miles an hour, and in blowing, it makes a prodigious noise. Its speed, when harpooned, is very great. Scoresby mentions an instance of one carrying out 3000 feet of line in a minute. It is not easily captured; and whalers dislike it, because the Greenland whale is seldom found near it, whilst its own value is very inferior, owing to the comparative thinness of the blubber, and the shortness and inferior quality of the whalebone. It is, however, an important object of pursuit to the Laplanders and Greenlanders, who wear it out by assailing it with weapon after weapon, and finally divide the spoil. A large R. yields 4000 gallons of oil.—The R. does not feed so exclusively on small prey—*acalepha*, molluscs, &c.—as the Greenland whale. Its gullet is much wider, and it preys much on fishes, the shoals of which it follows into bays and estuaries, devouring them in multitudes. The stomach of a R. has been found to contain 600 large cod, and a great quantity of pilchards. One which frequented the Firth of Forth for 20 years was well known to the fishermen there, and much detested by them. It was at last stranded at Abercorn in 1692. It was 78 feet long.—In the southern seas, another species of R. is found (*R. B.*, or *P. Australis*), which has a long dorsal fin, placed further forward than in the northern rorqual. It attains a large size. The South Sea whalers do not care to pursue it. Its range seems to extend to the northern hemisphere in the Pacific.

ROSA, SALVATOR, was born at Renella, in the neighbourhood of Naples, in 1615. His first instructor was Francesco Francanziani, who had married his sister. Some of his landscapes attracted the notice of Lanfranco, who purchasing them, enabled and encouraged the young artist to pursue his studies. He became a pupil of Aniello Falcone, a painter of battle-pieces, and afterwards of Spagnoletto. Having gone to Rome, he was employed to paint an altar-piece and some other works by the Neapolitan cardinal Brancacci, and he accompanied Prince Carlo de Medici to Florence, and executed several important works for him. He finally settled in Rome in 1638, and died there, March 15, 1673. Salvator has a great reputation as a painter, and he owes this mainly to his landscapes, which, though faulty in many respects, arrest attention by originality in subject and treatment, being generally representations of wild and savage scenes, executed with a freedom and decision remarkably appropriate. Salvator executed numerous etchings, highly characteristic of his peculiar style.

Northern Rorqual.

world. The northern R. sometimes rather exceeds 100 feet in length. Concerning the species of this genus, there is great doubt and uncertainty. Some naturalists confidently assert the existence of several species in the northern seas, and a genus, *Rorqualus* or *Physalus*, has been constituted distinct from *Balenoptera*, the largest species being referred to

ROSACEA—ROSARY OF THE BLESSED VIRGIN MARY.

ROSA'CEA, known also as **GUTTA ROSEA** and **ACNE ROSACEA**, is a disease which usually first appears at or near the end of the nose; and in some cases it is confined to the nose, while in others it extends to the cheeks, forehead, chin, or even to the whole face. The skin in the part affected assumes a deep red colour, which usually disappears after a time, but returns either on no special provocation, or in consequence, apparently, of some gastric disturbance, and after a time becomes permanent; pustules of acne—a chronic pustular disease of the skin—now appear, and their yellowness contrasts strongly with the redness with which they are surrounded. The skin of the diseased part becomes irregularly swollen, and is marked with blue or red streaks, caused by congestion and enlargement of the capillaries; the whole surface, in a severe case, presenting a very disagreeable and repulsive appearance. This affection is no doubt often a result of intemperate living, but it may occur in persons of regular habits of life. Disorder of the digestive system is so often associated with it, as to exclude the idea that the combination is accidental, and the skin disease may often with great probability be referred to gastric disturbance as the exciting cause. The disease is confined almost exclusively to persons in middle or advanced life, and women are especially liable to it about the period in which what is popularly known as the 'change of life' occurs; moreover, it has occasionally been observed to be hereditary. The general treatment consists in the administration of the compounds of iodine and mercury (singly or conjoined) in alterative doses, and Donovan's Solution has been especially recommended; and a nourishing but bland and non-stimulating diet should be prescribed. In the early stages of the disease, the local treatment should be soothing. Emollient lotions, such as emulsion of bitter almonds, cream, glycerine, &c., may be occasionally used during the day, and in severe cases a bread poultice may be applied to the face at night. When the affection becomes indolent, the emollients should be gradually replaced by stimulating applications, such as Eau de Cologne, or a solution of corrosive sublimate in alcohol, in the proportion of from 1 to 2 grains in the pint; and at a still later stage, iodide of sulphur ointment, in the proportion of 15 grains or a scruple of the iodide to an ounce of lard, is well deserving of a trial. When the disease is of long standing, it sometimes defies all known remedies.

ROSACEÆ, a natural order of exogenous plants, containing many species of great usefulness, and many that are in the highest esteem for their beauty. It contains trees, shrubs, and herbaceous plants, natives chiefly of cold and temperate regions, and far more abundant in the northern than in the southern hemisphere. Within the tropics, they are chiefly but not exclusively found in elevated situations. The leaves are alternate, have stipules, and are either simple or compound. The flowers are generally hermaphrodite, but sometimes unisexual; the inflorescence various. The calyx is 4–5-lobed, generally 5-lobed; the petals as many as the divisions of the calyx, or occasionally wanting, perigynous. The stamens are few or many, arising from the throat of the calyx; the ovary sometimes solitary, sometimes there are several ovaries; each one-celled, with a lateral style; or a number of ovaries are united into a many-celled pistil; the ovules generally two or more. The fruit is sometimes a drupe; sometimes a pome; sometimes follicular; sometimes an achænium; sometimes a heap of achænia, or of one-seeded berries; sometimes a heap of achænia, covered with the fleshy

tube of the calyx.—This natural order contains at least 1000 known species; but in some of the genera, as *Rosa* and *Rubus*, the determination of the species is attended with great difficulty, and varieties—sometimes reckoned species—are numerous.—The order, as generally received, is divided into a number of sub-orders, several of which have by some botanists been elevated to the rank of distinct orders, as *Amygdaleæ*, *Pomaceæ*, *Sanguisorbeæ*. See also *ROSE*, *RUBUS*, *STRAWBERRY*, *POTENTILLA*, *TORMENTIL*, *AGRIMONY*, *GEUM*, *KERIA*, *SPIRÆA*, *CUSCO*, &c.

ROSARY OF THE BLESSED VIRGIN MARY (Lat. *rosarium*, a chaplet of roses), the name given to a very popular form of prayer in the Roman Catholic Church. The name rosary has been variously traced either to the title 'Mystical Rose,' one of the titles under which the Blessed Virgin is addressed in the Litany of Loretto (q. v.), or to St Rosalia's wreath of roses well known in sacred art, or to the beads being originally made commonly of rosewood. The origin of the devotion itself is popularly traced to St Dominick (q. v.); but it is quite certain that its characteristic feature, the use of beads as a means of reckoning the number of repetitions of a certain prayer, is of far greater antiquity. See BEADS. Palladius tells of the Abbot Paul, whose daily practice it was to repeat the Paternoster 300 times, that he used a number of small pebbles to secure a correct enumeration, dropping one of them into his lap at each repetition. Later, a string of beads, worn round the neck, and called *Beatus*, was substituted. As the same use of beads existed among the Mohammedans, some writers have traced the Roman Catholic practice to a Mohammedan origin; but it appears quite certain that the practice existed among Christians before the time of Mohammed. Originally, the prayer so repeated was the Lord's Prayer; but when, in the 11th and 12th centuries, the so-called angelical salutation: 'Hail, Mary!' &c., became a frequent form of prayer, it was added to the 'Our Father;' and it seems beyond all doubt that the rosary in its present form was, if not devised, at least fully introduced and propagated by St Dominick. The rosary, although called of the Blessed Virgin Mary, is a series of fifteen prayers, founded on the chief mysteries of the incarnation and passion of our Lord, interspersed with repetitions of the 'Our Father,' the 'Hail, Mary!' and the doxology. It consists of three parts, each of which contains five so-called mysteries, connected with our Lord's incarnation and public mission on earth, his passion and death, his resurrection and ascension, and the assumption of the Blessed Virgin Mary. Each of these parts thus contains five mysteries (called also 'decades' from the ten 'Hail, Maries') consisting of (1) a 'meditation,' briefly proposing the mystery which is to be meditated upon; (2), one 'Our Father;' (3), two 'Hail, Maries;' (4), one doxology; (5), a prayer begging for the special grace or fruit appropriate to the particular mystery. The whole rosary, therefore, consists of 15 mysteries or decades, and thus comprises 15 'Our Fathers' and 'Doxologies' and 150 'Hail, Maries.' The devotion of the rosary takes several forms. The 'Greater Rosary' consists of the recitation of the whole fifteen mysteries or decades, with their component prayers. The 'Lesser Rosary' consists of one of the three parts, or of five mysteries or decades. The 'Living Rosary' is recited by an association of fifteen individuals, each of whom engages to say daily one mystery. When recited publicly, the prayers are repeated alternately by the priest or other person presiding at prayer, and by the congregation. There is a

form of the rosary common in foreign countries, especially Germany, in which the substance of each 'mystery' is condensed into a short prayer of three or four words, which are appended to the 'Hail, Mary!' and thus serve perpetually to recall the subject to the mind of the person praying vocally. The rosary has been sanctioned and recommended by numberless popes and other ecclesiastical authorities, and Indulgences (q. v.) have been granted to persons reciting it with proper dispositions. It is regarded by Roman Catholics as one of their most excellent forms of prayer, and as placing the devotion to the Blessed Virgin Mary on its true footing—that of a devotion to the incarnation and death of her Son, Jesus Christ. It is expressly recommended for the poor and the ignorant; and there are instructions specially designed for these classes, in order to enable them to combine prayer of the mind with prayer of the lips.

The mechanical instrument, so to speak, of this devotion is also called by the name rosary. It consists of a string of beads, equal in number to the 'Our Fathers' and 'Hail, Marys' which are recited in the rosary—the 'Our Father' beads being of a larger size—one of which is passed through the fingers at each recitation of the prayer, and thus secures the person praying from errors of memory. The beads are of various material—berries, wood, stone, ivory, metal, &c., and are often of costly workmanship, and of considerable intrinsic value. They are blessed for the use of the people by the pope, by bishops and superiors of religious orders, and by others having special power for the purpose.

ROSAS, DON JUAN MANUEL, ex-president of the Argentine Confederation, born at Buenos Ayres in 1793, is descended from an ancient family of the Asturias. He entered the army of Buenos Ayres, and in 1829 rose to be governor or captain-general of his native province, then in federal union with Entre Rios, Corrientes, and Santa Fé. He shewed great courage and capacity in subduing the disaffected Indians, and internal peace being thus secured, he turned his attention to the state of the confederation, which, in 1835, was falling to pieces by the feebleness of its governments. A single president was, upon his recommendation, elected for the whole Argentine Confederation, and the choice fell upon Rosas. His residence was to be Buenos Ayres, and to this state were intrusted the external relations of the Confederation, and the management of the more important functions of the executive. Intestine commotion subsided under his rule, the industrial resources of the country were developed, and foreign commerce rapidly increased. The other states, however, became jealous of the growth and power of Buenos Ayres, and R. was accused of a design to extend and uphold the undue predominance of his state, and to give his native city a monopoly of the trade of the River Plate. In the execution of this design, he sought to compel Paraguay to join the Confederation. This involved R. in a war with Brazil, in which his troops were outnumbered, yet he obstinately kept up the struggle for five years. An attack on Monte Video was also rendered necessary by his policy; but England and France interfering for the protection of that city, R. was again defeated; yet he managed to resist the allied forces from 1845 to 1850. His rule had by this time become so oppressive and intolerable, that the subject states revolted, and selected Don J. J. Urquiza as their president and general. A battle ensued at Monte-Caseros, 3d February 1852, when R.'s forces were put to flight. Urquiza entered Buenos Ayres as president of the Confederation; and R., who was

compelled to flee, obtained a refuge in England, in which country he has for the most part resided since the year 1852.

ROSCIUS, QUINTUS, was born at Solonium, a village near Lanuvium, and rose to be the greatest comic actor in Rome. So much was he admired, that many of the Roman aristocracy befriended him, and the dictator Sulla, as a token of favour, presented him with a gold ring, the symbol of the equestrian order. Among his most admiring and affectionate patrons, R. also numbered Cicero, who, at the commencement of his career, received lessons in the art of elocution from the great comedian, and even in later life used to make trials of skill with his instructor as to which of them rendered a thought most clearly and effectively—the orator by his diction, or the comedian by his gesticulation. So sensible was R. of the distinction he enjoyed in sharing the intimacy, and even the friendly emulation of the great orator, that he came to look upon his art as one of no small importance and dignity, and wrote a treatise on the comparative methods and merits of eloquence and acting. Cicero's friendship was of use to him in another way, for on his being sued at law by C. Fannius Chærea for the sum of 50,000 sesterces, Cicero defended him before the judex Piso (probably 68 a.c.) in his extant oration, *Pro Q. Roscio Comedo*. He died 62 a.c., having attained such perfection in his peculiar art, that to be a 'Roscius' became synonymous with pre-eminence in every profession, and leaving, like his famous contemporary, *Æsopus* the tragedian, an immense fortune, realised upon the stage.

ROSCOE, WILLIAM, the eminent historian of Lorenzo de' Medici and Leo X., was born near Liverpool on the 8th of March 1753. His father was a market-gardener, whose assistant in this business he became in his twelfth year, after receiving the rudiments of learning at a common school. In this occupation he continued for about three years, during which his fondness for reading developed itself; and in 1769, after making trial for a year of a bookseller's shop, he was articled to an attorney at Liverpool, where, in 1774, being admitted an attorney of the Court of King's Bench, he began to practise on his own account. During all this period, he assiduously cultivated his mental powers, turning his attention to the classics, and especially to the Italian language and literature. In 1773, he first appeared in print as the author of a poem; and in 1777, a collection of some of his earlier pieces was published, containing his first protest against the slave-trade, of which, throughout his life, he was a strenuous opponent. In 1796 was published the first volume of his *Life of Lorenzo de' Medici, called the Magnificent*, which had been begun many years before, and in the composition of which he was greatly aided by the collection for him of valuable materials in Italy, from sources in print and manuscript, by his friend Mr Clarke. The success of this work was extraordinary, and it at once established his literary reputation. The work was received with the highest approbation by those who were best able to appreciate its merits, both in England and on the continent, especially in Italy; it went through several editions, and was translated into German, French, and Italian. In 1805, appeared his second great work, the *Life and Pontificate of Leo X.*, for which, with the assistance of others, he had been collecting materials for many years. This work also, which, like the former, appeared successively in German, French, and Italian, was received with much commendation by the most impartial judges, though its tone and

spirit, especially with reference to the Reformation, were severely criticised by others.

R. at one time had thoughts of adopting the bar as a profession; but about the year 1800, he became partner in a Liverpool bank, a step which involved him eventually in great pecuniary embarrassment. In 1806, he was returned to parliament for Liverpool in the Whig interest, and had the gratification of taking part in the abolition of the slave-trade, but did not again come forward after the dissolution in 1807. He was, throughout, a consistent opponent of the war with France, against which he published several pamphlets, and was on all points the advocate of liberal opinions. He took an active part in founding the Liverpool Royal Institution, and was a zealous promoter of literature, and patron of the fine arts. R. died at Liverpool, June 30, 1831. During the latter years of his life, he devoted himself much to the study of botany, and in honour of him, a rare genus of Monandrian plants received in 1826 the name *Roscoeæ*.

ROSCOMMON, an inland county of Ireland, in the east of the province of Connaught, and bounded on the east by the river Shannon, is 60 miles long from north to south, by 40 miles from east to west. Area, 607,691 acres, of which 440,522 are arable. Pop. (1871) 140,670. Number of primary schools, 250, attended by 15,791 pupils (of whom 15,020 were Catholics). 737 persons speak Irish only. Number of emigrants from R. between 1851 and 1871, 52,299. The surface of R., which belongs to the central plains of Ireland, is level, with undulations rising in the south into the Slieve Bawn range, the highest point of which is 867 feet in height; and on the north, into the Curlew Mountains, of which Slieve Curkagh attains a height of 1098 feet. Its principal rivers are the Shannon (q. v.) and the Suck. R. communicates by means of the Midland Great Western, the Southern and Western, and North-western railways, with all the extremities of the kingdom. In geological structure, it belongs to the central limestone formation, in some districts of which the sandstone protrudes. The soil in the central district is in general light, but fertile, and affords the finest sheep-pasture in Ireland—the celebrated 'Plain of Boyle.' Some portions also contain a rich and fertile loam, which produces good cereal crops; but the chief industry of the R. farming population is the feeding of sheep and cattle, especially the former.—The county can hardly be said to possess any manufacture worthy of mention. The chief towns are Roscommon (q. v.), Boyle, Castleress, Elphin, Strokestown. Ballinasloe and Athlone lie upon the border, and are partly within this county. R., in the ante-English period, was the country of the sept of MacDermot, O'Daly, O'Kelly, and above all, O'Connor, of which there were two branches, that of the O'Connor Roe (red), and that of O'Connor Don or Dhun (brown). The present representative of the O'Connors, the O'Connor Don, is one of the very few Irish princes who have succeeded to the hereditary estates of their ancestors.

R. sends two members to the imperial parliament. It possesses a vast number of antiquities of the Celtic period, raths, &c.; a portion of a round tower at Oran, several remains of strong castles of the English period, and some fine ecclesiastical ruins, of which Boyle, Roscommon, Tusk, and Clonsanville are the principal.

ROSCOMMON, the capital and assize town of the county of the same name, Ireland, in the middle of the county, 96 miles west-by-north from Dublin. The population, in 1861, was 2699; in 1871, 2722. Of the inhabitants less than 300 are Protestants. R.

dates from the 13th c., when it arose around a Dominican abbey, founded by the O'Connor in 1257, and a castle built soon after by Sir Robert de Ufford; the remains of both of which structures still exist. R. is a market-town, in which corn is the principal commodity. It has scarcely any manufacture, and little commercial enterprise of any kind. It returned two members to the Irish parliament, but was disfranchised at the Union. Two newspapers are published here.

ROSCREA, a market-town of the county of Tipperary, Ireland, 94 miles south-west-by-west from Dublin, with which it is connected by a branch from the Great Southern and Western Railway. The population in 1861 was 3543; in 1871, 3165. Of this number, 200 were Protestants of the Episcopal Church. R. is a very ancient town, dating back to the early Christian period, when a monastery was built upon this site in the beginning of the 7th century. The modern town is tolerably well built; the Roman Catholic Church is a handsome structure; and there are considerable remains of the ancient greatness of the place—a castle, a lofty round tower, 80 feet high, and ruin of two abbeys. The only manufacture is coarse woollen cloth, but there is a considerable market for agricultural produce. There are several schools, some with endowments of ancient date.

ROSE (*Rosa*), a genus of plants of the natural order *Rosaceæ*, consisting of shrubs, generally with prickly stems and pinnate leaves, the leaves terminating in a single leaflet; stipules at the base of the leaf-stalks; the calyx 5-fid, its tube contracted at the summit, and finally becoming fleshy, and forming a chief part of the fruit; the corolla of five petals; the stamens numerous; the styles springing from the narrowed throat of the calyx, free, or aggregated into a column. The flowers are generally of the red tint well known as rose-colour, but sometimes white, more rarely yellow, and sometimes striped. The fruit (*Hip* or *Hep*) consists of the enlarged and coloured tube of the calyx, within which are contained many *Achenia* (q. v.) amidst prickly hairs. The species are very numerous, even after allowance has been made for a great number of varieties elevated into species. There is no genus of plants in which the limits of species are more difficult to define, or in which varieties are more apt to be regarded as species. In Withering's *British Botany*, published near the end of last century, only five British species of R. are given; in Hooker and Arnott's *British Flora*, 19 species are recognised, whilst many forms reckoned as species by some botanists, are noticed as mere varieties. Roses are natives of all the temperate parts of the northern hemisphere, and of its colder regions, even to Lapland and Hudson Bay. They have long been among the choicest favourites in flower-gardens, for the beauty and fragrance of their flowers; and, more than any other flower, emblems of everything beautiful and delightful. Countless varieties—single and double—have been produced by cultivation, which it is often extremely difficult to refer to their original species.—Amongst the ancients, the R. was sacred to Eros or Cupid, and Aphrodite or Venus, and was accounted the emblem of joy and love, and at the same time of prudence. Its opening buds are a favourite poetic image of innocence and purity.—Among the roses best known to the ancients was the HUNDRED-LEAVED R. (*R. centifolia*), excelled by no other species in beauty and fragrance. It is a native of the Caucasus, and has been cultivated in gardens from very ancient times. Amongst the numberless varieties are the Moss R., the calyx of

ROSE—ROSE ACACTIA.

which sends forth branching excrescences, so that it seems overgrown with moss, the flower—which is only known as a double rose—being exquisitely beautiful and fragrant; the PROVENCE or CABBAGE R., one of the most common, and also one of the finest roses; the small-flowered BURGUNDY R., &c.—The FRENCH R. (*R. Gallica*) is a native of the south of Europe. Many varieties of it are cultivated, particularly very beautiful double ones. It is distinguished by its hard leaves, which have a peculiar dryness, and its much expanded petals. It has a fainter smell than *R. centifolia*, but its petals are more astringent, and are preferred for the preparation of *Vinegar of Roses* and *Conserve of Roses*.—The DAMASCUS or DAMASK R. (*R. Damascena*), a native of Syria, is much cultivated, and is sometimes called the MONTHLY R., which name, however, is more frequently given to the China Rose.—The MUSK R. (*R. moschata*) is a native of the north of Africa and the south of Spain. Its flowers have a strong and delightful fragrance; they are white, and disposed in rich corymbs. It has been cultivated in England since the end of the 16th century.—The DOG R. (*R. canina*) is common in Britain, and throughout Europe, also in the north of Asia, growing in thickets and hedges. It varies, even in a wild state, in the colour of its flowers, which are red, pale, or white. It has long straight shoots, which are often used as stocks for ornamental rose-trees, other kinds of R. being budded upon them. The bark of the root was formerly esteemed of peculiar virtue in preventing fatal consequences from the bite of a mad dog; whence the name of the species.—The VILLOUS R. (*R. villosa*), another common British species, has the fruit larger and more fleshy than the Dog Rose. The leaves are downy.—The FIELD R. (*R. arvensis*) is common in many parts of Britain, in woods and hedges. It has white flowers. It is remarkable for its trailing habit, and long climbing or pendulous twigs, on account of which it is frequently planted and trained to cover walls and trellises. It is often called the AYRSHIRE R., although that name is shared by another kind of similar habit, which is regarded as a deciduous variety of the EVERGREEN R. (*R. sempervirens*), a native of the south of Europe. These often make shoots of 20 feet in a season. Of the same habit also is the MANY-FLOWERED R. (*R. multiflora*), a native of China and Japan, a very fine species, but not sufficiently hardy for the colder parts of Britain.—Very different in habit is the SCORCH R., or BURNET-LEAVED R. (*R. spinosissima*), a species common on heaths, sands, and chalk downs, in many parts of Britain; a low compact bush, with very small leaves and flowers. It is occasionally found in unfertile situations, so dwarfed in size as not to measure more than three inches from the very tip of the root to the centre of the flower (which is undiminished in size). Many fine double varieties are now in cultivation.—The ALPINE R. (*R. Alpina*) is a beautiful ornament of the Alps and of other mountains of Central Europe, remarkable for its flower-stalks bending down in an arch after flowering.—The SWEET BRIER R. (*R. rubiginosa*) is a bushy species, with small leaves and flowers, a native of Britain, but more common in some parts of continental Europe, growing in open bushy places, and remarkable for the sweet balsamic smell of its leaves, on account of which it is much planted in hedges and shrubberies. A kindred species (*R. suaveolens*) is found in North America.—The YELLOW R. (*R. lutea*), a native of Germany, is chiefly remarkable for the colour of its flowers, which, however, have a disagreeable bug-like odour. A fine variety is much cultivated, with petals

yellow externally, and bright red on the inside.—The INDIAN R., or CHINA R. (*R. Indica*), is a native of China, was thence carried to India, and is now also common in Europe, being a hardy plant, which does not suffer from the frosts of winter in any part of Britain, although it was at first introduced as a greenhouse plant. It is one of the most important additions recently made to our flower-gardens and shrubberies; flowering not only in the middle of summer, with the other roses, but throughout the year, even in winter, when the weather is mild. It is now very common throughout Europe. The name MONTHLY R. is often given to it from a notion that it flowers every month. The NOISSETTE R., remarkable for its extremely rich corymbs, and the TEA R., of which the dried leaves have a fine fragrance, and are said to be used in China for flavouring tea, are regarded as varieties of it. The odour of the flower is much fainter than that of many other roses; and the bush is never large.

Some kinds of R., as the China R., are easily propagated by cuttings, the other kinds by layers. The finer varieties are budded on stocks of some common kind. Many of the kinds require much pruning and attention of the gardener. The old shoots are cut out, and the young wood thinned and shortened. The flowering of a rose-bush may be retarded by cutting it closely down late in spring, and it will blossom when other roses have disappeared. Roses grow well in all ordinary soils, but are very sensitive to atmospheric influences, and do not succeed amidst the smoke of towns.

The genus *Lourea* has been separated from *Rosa* by Lindley, chiefly on account of the simple leaves. The only known species is a native of Central Asia.

The fruit of roses is used in medicine. See HIR. A mildly astringent and agreeable syrup, and other preparations, are made from the rapidly dried petals and buds of the French rose. A syrup is similarly made from the petals of the Hundred-leaved R.; and water distilled from them, *Rose Water*, is employed for various purposes on account of its agreeable odour. *Rose Vinegar*, made by steeping rose petals in vinegar, is useful as an external application in headaches, for dissipating unpleasant smells in apartments, &c. *Conserve of Roses* is made of the petals of roses pounded with sugar, and is useful as an astringent in diarrhoea of children. Oil or Otto (q. v.) of Roses is one of the most valuable of perfumes.

Rose-bushes are often much injured by a species of Aphis (*A. roseæ*), a small green insect, which swarms upon the leaves. A reddish fungus, *Puccinia roseæ*, often covers the leaves in the latter part of summer.

ROSE, in Heraldry. The heraldic rose is drawn in a conventional form, as in the subjoined woodcut, and never with a stalk, except when expressly directed by the words of blazon. Being sometimes argent and sometimes gules, it cannot be designated proper; but when blazoned 'barbed and seeded proper,' it is meant that the barbs are to be green, and the seeds gold or yellow. The rose gules was the badge of the Plantagenets of the House of Lancaster, and the rose argent of that of York. The York rose was sometimes surrounded with rays as of the sun, and termed *rose en soleil*. As a mark of cadency, the rose has been used as the difference of the seventh son.

ROSE, THE, a popular name for Erysipelas (q. v.), which is also known as St Anthony's Fire, *Ignis Sacer*, &c.

ROSE ACACTIA. See ROBINIA.

Rose.

ROSE APPLE. See **EUGENIA**.

ROSE BEETLE (*Cetonia aurata*), a coleopterous insect of the section *Pentamera*, of the tribe *Lamellicornes*, and not distantly allied to cockchafers and to the true beetles, or *Scarabaei*. It is a common British insect, about an inch long, of a shining green above, coppery red underneath, with white marks on the elytra. In its perfect state, it frequents flowers, particularly the rose; in its larva state, it inhabits rotten timber, the roots of vines, &c., and is often found in ants' nests, apparently feeding on the small particles of wood which the ants have collected. It remains about three years in the larva state, makes a cocoon of particles of wood, glued together by an excretion of its own; passes the winter as an inactive pupa, and appears in summer in its perfect form. It flies well, with a sort of humming noise, from flower to flower, feeding on honey, and in order to reach it, devouring the nectaries.—In North America, the name Rose Beetle is given to another coleopterous insect of the tribe *Clavicornes*, about one-third of an inch in length. It is very injurious to gardens and nurseries in North America, its ravages extending to many plants besides the rose. These insects often appear suddenly in swarms, and disappear as suddenly.

ROSE-ENGINE. See **TURNING**.

ROSEMARY (*Rosmarinus*), a genus of plants of the natural order *Labiata*, and nearly allied to Sage (*Salvia*), from which it differs in its filaments having an awl-shaped tooth, directed downwards a little above the base. Only one species is known, *R. officinalis*, an evergreen erect shrub of 4–8 feet high, with linear leaves, and pale bluish flowers, growing in sunny places, on rocks, old walls, &c., in the countries around the Mediterranean Sea, and generally cultivated, as an ornamental and aromatic

Rosemary (*Rosmarinus officinalis*).

shrub, throughout the rest of Europe. The leaves have a short whitish-gray down beneath, a penetrating camphor-like odour, and a pungent aromatic and bitter taste. They contain a large quantity of an essential oil, *Oil of R.* ($C_{10}H_{16}O_2$), which is not unfrequently used as a stimulating liniment, to promote the growth of the hair, and as a perfume. *Spirit of R.*, made by distillation of sprigs of *R.* with

rectified spirit, is used to give a pleasant odour to lotions and liniments. *R.* has been advantageously administered internally in cases of chronic diarrhoea and of a relaxed state of the system.—*Oil of R.* is a principal ingredient of the perfume called *Hungarian Water*, or *Queen of Hungary's Water*.—The name Wild *R.* is given to *Ledum palustre*, a shrub with narcotic acid properties.

ROSEN, FRIEDR. AUG., born in Hanover, September 2, 1805, entered Leipzig University in 1822, where he devoted himself to the study of the biblico-oriental languages, and went to Berlin in 1824, where he studied Sanscrit under Bopp, and published his first work, *Radices Sanscritae* (Berl. 1827). Subsequently, he was called to London University as Professor of Oriental Literature, where he edited the oldest of the still extant Arabic handbooks of Algebra, by Mohammed ben Musa (Lond. 1831). In 1831, *R.* resigned his professorship. During the next few years, he wrote a portion of the oriental articles for the *Pearcy Cyclopaedia*, undertook the revision of the Sanscrit Bengali Dictionary of Houghton (Lond. 1825) which may be considered entirely his own work, and compiled for the British Museum the catalogue of Syrian manuscripts, which was only published after his death (Lond. 1839). As secretary of the Asiatic Society, he conducted its entire foreign correspondence. Colebrooke entrusted to him the publication of his *Miscellaneous Essays* (2 vols., Lond. 1837). In 1836, he had begun the publication of the Collection of Hymns of the *Rigveda*, when he died September 12, 1837. His unfinished work on the Vedas was published by the Asiatic Society under the title *Rigveda-Sanhita, liber primus, Sanscrita & Latine* (Lond. 1838).—His younger brother, **GEORG ROSEN**, has also acquired a reputation as an oriental scholar.

ROSENAU, a town of Hungary, beautifully situated on the Sajo, 105 miles north-east of Pesth. It has colleges and a Franciscan convent. There is mining done in the neighbourhood, and there are manufactures of woollen cloth and linen, of stoneware, leather, and paper. Pop. 5000.

ROSENMÜLLER, JOHANN GEORG, a German divine and professor of theology, was born at Ummerstädt in Hildburghausen, 18th December 1736. He was appointed Professor of Theology at Erlangen in 1773, Primarius Professor of Divinity at Giessen in 1783, and was called in 1785 to Leipzig, where he remained till his death in 1815. His chief writings are: *Morgen- und Abendandachten* (7th ed. Leip. 1820); *Betrachtungen über die vornehmsten Wahrheiten der Religion auf alle Tage des Jahres* (4 vols. Leip. 1801); *Auserlesenes Beicht- und Communionbuch* (12th ed. Nürnberg. 1827); *Predigten aus auserlesenen Stellen der Heiligen Schrift* (3 vols. Leip. 1811–1813); *Beiträge zur Homiletik* (Leip. 1814); *Scholia in Novum Testamentum* (6 vols.; 6th ed. by his son, E. F. K. Rosenmüller, Leip. 1815–1831); and his *Historia Interpretationis Librorum Sacrorum in Ecclesia Christiana* (5 vols. Leip. 1795–1814). After his death appeared *Handbuch eines allgemeinen fasslichen Unterrichts in der Christlichen Glaubens- und Sittenlehre* (2 vols. Leip. 1818–1819).—**ERNST FRIEDRICH KARL ROSENMÜLLER**, eldest son of the foregoing, distinguished himself as a biblical critic and orientalist. He was born at Hildburghausen, 10th December 1768, studied at Leipzig, became Extraordinary Professor of Oriental Literature in 1795, Ordinary Professor in 1813, and died 17th September 1835. He was a more accurate and solid scholar and a keener critic than his father. He shared the rationalism of his time, but never carried it to an extreme. His masterpiece, the *Scholia*

in *Vetus Testamentum* (11 vols. Leip. 1788—1835), is a most comprehensive and learned production, well worthy of consultation on any important point of biblical criticism. Other works of R.'s are: *Handbuch für die Literatur der biblischen Kritik und Exegese* (4 vols. Gött. 1797—1800); *Das alte und neue Morgenland oder Erläuterungen der Heiligen Schrift* (6 vols. Leip. 1818—1820); *Handbuch der biblischen Alterthumskunde* (4 vols. Leip. 1823—1831); *Institutiones ad Fundamenta Linguae Arabicae* (Leip. 1818); and *Analecta Arabica* (2 vols. Leip. 1825—1826).—A younger brother, JOHANN CHRISTIAN ROSENMÜLLER (b. 1771, d. 1820), also acquired a reputation as a writer on anatomy, &c.

ROSE-NOBLE (commonly called also *penny of gold*), an English gold coin, first struck by King Edward III. in 1334, and current at the value of 1s. 8d. sterling; half-nobles, *oboli*, or gold half-pence, and quarter-nobles, otherwise called *gold urthings* and *quadrans*, were also coined soon after. The term 'rose-noble' was given to the coin because it was of the same value as the 'noble,' a money of account, and was stamped on one side with the figure of a rose. The Rose-noble and its halves and quarters ceased to be coined after 9 Henry V.; but the 'noble,' the money of account, was used till a much more recent period.—The noble also existed in the Scotch coinage, and was equivalent to one-twelfth of the English coin.

ROSE OF JERICOHO (*Anastatica hierochuntica*), a plant of the natural order *Cruciferae*, which grows in the sandy deserts of Arabia; and on rubbish, the roofs of houses, and other such situations, in Syria and other parts of the East. It is a small, bushy, terbacous plant, seldom more than six inches high; with small white flowers; and after it has flowered, the leaves fall off, and the branches become incurved towards the centre, so that the plant assumes an almost globular form, and in this state it is often blown about by the wind in the desert. When it happens to be blown into water, the branches expand again, and the pods open and let out the seeds. Numerous superstitions are connected with this plant, which is called *Rosa Maria*, or *Rose of the Virgin*. If taken up before it is quite withered, the plant retains its hygrometric property of contracting in drought and expanding in moisture, for years.

ROSEOLA is a common skin disease, included in the division *Rashes*, and sometimes described under the term *Scarlet Rash*. In some cases, it begins with light febrile symptoms and gastric disturbance, which subside in two or three days, when the rash appears; in other cases, no preliminary fever occurs. The eruption first appears upon the face, neck, and chest, in specks or small patches, which have a tendency to coalesce; and in severe cases, the whole surface of the body assumes a uniformly red tint. The eruption is usually accompanied by itching of the affected parts, and by redness and slight soreness of the throat, and seldom lasts more than two or three days, when it gradually fades away; and its disappearance is not followed by the desquamation of epidermis, which is one of the natural sequelæ of scarlatina and certain other skin diseases. The rash differs considerably in appearance in different cases. The disease is never contagious, and one attack affords no immunity from a second.

Among the causes of roseola may be mentioned the irritation excited by dentition, gastric and intestinal irritation, excessive acidity of the stomach, the sudden checking of profuse perspiration, the drinking of cold water when the body is overheated, &c. It often precedes the distinctive eruptions of small-pox and varioloid; and is noticed to

be of most frequent occurrence during the prevalence of measles and scarlatina. The diseases with which it may be confounded are erythema, measles, and scarlatina, and it is sometimes impossible to discriminate with certainty between roseola and mild cases of scarlatina, when the former is attended with sore throat. The treatment is very simple, as the disease would probably always terminate favourably if left entirely to itself. If there is a suspicion that the case should turn out to be one of scarlatina, an emetic of ipecacuanha should be given, and the bowels should be freely acted on. In ordinary cases, a few days' confinement to the house, a spare and non-stimulating diet, saline laxatives—such as Seidlitz powders—and an occasional warm bath, if there is much cutaneous irritation, or if the eruption has a tendency to recede too suddenly, constitute all the treatment that is expedient.

ROSES, WAR OF THE, a disastrous civil contest which desolated England during the 30 years from 1455 to 1485, sacrificing 80 princes of the blood, and the larger proportion of the ancient nobility of the country. It was so called because the two factions into which the country was divided upheld the two several claims to the throne of the Houses of York and Lancaster, whose badges were the white and the red rose respectively. After the House of Lancaster had possessed the throne for three generations (see PLANTAGENET), Richard, Duke of York, whose title to the throne was superior to that of Henry VI., began to advance, at first somewhat covertly, his claim to the throne. In 1454, he was appointed Protector of the realm during Henry's illness, and on the king's recovery, he declined to give up his power, and levied an army to maintain it. For an account of the Wars of the Roses, see EDWARD IV., EDWARD V., RICHARD III., and HENRY VII. The accession of Henry VII. may be said to have terminated the Wars of the Roses, although the reign of Henry was from time to time disturbed by the pretensions of Yorkist impostors.

ROSETTA, a city of Egypt, situated on the west bank of the old Bolbitic branch of the Nile, about 4 miles above the mouth, in 31° 25' N. lat., and 30° 28' 20" E. long. The name is supposed to be an old Egyptian one, and to have been derived from *Rusat*, or the mouth of the plains. Here was discovered the so-called Rosetta Stone, or trilingual inscription in the hieroglyphic, demotic or enchorial, and Greek language, which was the key to the interpretation of the hieroglyphs. It is of black basalt, about 3 feet 7 inches in length, and 2 feet 6 inches in width, containing about one-third of the hieroglyphic, and nearly all the Greek and Roman portions, the upper part and portion of the side having been broken away. The contents of the inscription are a decree in honour of Ptolemy Epiphanes by the priests of Egypt assembled in a synod at Memphis, on account of his remission of arrears of taxes and dues owed by the sacerdotal body. It was set up 195 B. C., and is the only one of the numerous examples ordered to be placed which has been brought to light. This monument was discovered in 1799 by M. Boussard, a French officer of engineers, during the French occupation of Egypt, in an excavation made at Fort St Julien, near Rosetta. More recent excavations have shewn that it was found on the site of a temple dedicated by the Necho II. of the 26th dynasty to the solar god Atum, or Tum. By the Arabs, R. is called *Rashid*. It first rose into importance when the accumulation of mud had silted up the Damietta branch, and destroyed the importance of that city. It has been much praised for its verdure and charming gardens, which

present an agreeable contrast to the barren wastes by which it is surrounded. It contains a mixed population, supposed to be about 16,000 in number. The streets are narrow, running north and south. The river has a sandbar at the mouth, preventing the entrance of large ships-of-war. It was unsuccessfully attacked by the British in 1807.

ROSETTA WOOD is a furniture-wood of a lively orange-red colour, with very dark veins. It is imported from the East Indies in logs about a foot in diameter; but it is not known what tree produces it. It is little used, because, although extremely beautiful when first cut, the colours become dark by exposure.

ROSE QUARTZ, a variety of Quartz (q. v.), often crystallised in the form of Rock-crystal (q. v.), but also found massive or imperfectly crystallised. It differs from common quartz and rock-crystal chiefly in its colour, which is of a delicate pink or flesh colour, sometimes crimson or nearly so. The colour is due to the presence of manganese. R. Q. is valued as an ornamental stone, the larger masses being made into vases, &c., the smaller pieces into jewels, seals, &c. A bright red kind is known as *Bohemian Ruby*, and is sometimes fraudulently sold as ruby.

ROSE-WATER. See **PERFUMES**.

ROSE-WINDOW, a circular window with tracery.

ROSEWOOD, a name given to the wood of a number of different trees, valued for beauty, and used for ornamental furniture.—The R. of commerce has been thought to be the produce of a species of *Mimosa*, a native of Brazil. It is also said that R. is the timber of several species of *Triptolomea* (natural order *Leguminosae*, suborder *Papilionaceae*); but the trees yielding R. are, in general, still doubtful to the botanist, although different kinds of R., imported from South America, are much used for veneering, in making furniture, musical instruments, &c. R. has for a long time been second only to mahogany as a furniture-wood in Europe. It has a dark blackish-brown colour, beautifully marked with streaks of dark red, and when being sawn or cut, yields an agreeable smell of roses, from which it receives its name. We receive it chiefly from Para and Maranhão, in logs usually about ten feet in length; each log is only half the trunk, which is split in two to be sure it is sound. In the year 1867, the imports of this wood into Great Britain amounted to 558 tons, of the value of £5800. One valuable kind of R. is yielded by an East Indian tree, *Dalbergia latifolia*, also called *Blackwood*. It is found chiefly in Malabar, and grows to a height of about 50 feet, with handsome spreading branches and pinnate leaves. It is of the natural order *Leguminosae*, suborder *Papilionaceae*. The timber is very valuable. It is much used in Bombay for ornamental furniture. Planks of 4 feet in breadth are sometimes obtained, after the sapwood has been removed. The increasing value of the wood has led to the formation of new plantations, under the care of the government conservator of forests, in several parts of the Madras presidency.

ROSIERUCIANS, the name of a secret society of the 17th c., which is involved in much mystery, and the history of which has led to a great deal of discussion. The name is explained by Mosheim and others, as derived from *ros*, dew, and *cruz*, the cross. **CRUX** is supposed mystically to represent **LUX** or light, because the figure + exhibits the three letters LVX; and light, in the opinion of the

Rosierucians, is that which produces gold. Now dew (*ros*) is the greatest solvent of gold in the ancient science of alchemy. But without insisting on this very mysterious explanation of the name Rosierucians, we must be content with an account of the association itself. The beginning of the 17th c. was a period which manifested an extraordinary tendency to mysticism in science as well as in religion; alchemy, astrology, and divination divided the public interest with Pietism in the Protestant world, and the Convulsionist mania in the Catholic community. A remarkable impulse was given to this tendency by the simultaneous appearance of two anonymous books, printed at Cassel in 1614, in German, entitled *Universal and General Reformation of the whole wide World*; together with the *Fama Fraternitatis, or Brotherhood of the Illustrious Order of the R. C. (Rosy Cross)*; to the *Rulers, States, and Learned of Europe*; printed at Cassel, by William Weesel. The first of these books is a kind of mystic allegory. In the reign of Justinian, Apollo, finding the world full of every kind of corruption, resolves on effecting a reformation; and with this view, calls up the seven wise men of Greece, and three Roman philosophers, of whom Cato and Seneca are the chief advisers. Their deliberation forms the subject of the book, which is a satire at once on the philosophy and the political systems and governments of the age. The *Fama Fraternitatis* is the story of a certain holy and reverend Brother Christian Rosenkreuz (i. e. Rosy Cross), who is represented as living in the 14th century. This Father, a German of noble birth, having been educated in a monastery, conceives a design for the reformation of the world; and after learning at Jerusalem and Damascus all the science of the Arabians, spends three years at Fez, in Morocco, in the study of the magical science of the Moors, and returns to Germany, where he establishes, in a house under the title Sancti Spiritus, with the aid of seven monks from the convent where he had been educated, a fraternity, which is the original brotherhood of the Rosy Cross. These adepts having framed a system with secret symbols, and committed it to paper, sent forth Father Rosenkreuz to propagate the brotherhood, which was to be kept secret for 100 years, the members, however, meeting once each year in the mother-house of Sancti Spiritus. Rosenkreuz died at the age of 106, and the place of his burial was held secret by the adepts; but he ordered that an inscription should be placed on one of the doors of Sancti Spiritus: 'Post cxx. annos patebo.' In the following year, 1615, a third tract appeared, also in German, entitled *Confessio, or Confession of the Society or Brotherhood R. C.*, which purports to be a defence of the brotherhood from the false rumours of circulation regarding it. The mixture of absurdity with seeming fanaticism displayed in these books has long proved a literary puzzle, of which not the least plausible solution is that which regards them as simply a serio-comic satire on the philosophical follies of the time, written by Johann Valentine Andreæ, of Herrenberg, as a mere exercise of humour, and without the intention or the expectation of their serious acceptance. Certain it is that whatever was the secret of the Rosierucians, if there really was any, it has been well kept. They are not heard of for the rest of the 17th c., nor their supposed connection with the Illuminati: Weishaupt, at the close of the 18th c., is more than doubtful. Equally doubtful is the theory of their connection with the Templars. From a book entitled *Curious Things of the Outside World: Last Part* (Lond. 1861), it would appear that the Brethren of the Rosy Cross are not yet extinct. See *Baba*,

Über Ursprung und Schicksale des Ordens der Rosenkreuzer (Göttingen 1803).

ROSIN, CHEMISTRY OF. See **RESINA**. When common Turpentine (q. v.), obtained from several species of Pine (q. v.) and Fir (q. v.), is distilled with water, it yields nearly one-fourth of its weight of essential oil, while the residue in the retort consists of common rosin, or colophony. There are two principal varieties of rosin, one of which is of a brown, and the other of a white colour. The brown variety is furnished by the Norway Spruce Fir, and is an amber-coloured brittle solid, consisting of two isomeric acids, the *sylicic* and *pinic*, having the common formula, $C_{10}H_{16}O_2$. Pinic acid, which is the more abundant of the two, is soluble in cold alcohol, from which it is obtained on evaporation as an amorphous mass. When heated to partial decomposition, it yields another isomeric acid, the *colophonic*. The white variety of rosin, known commercially as *Galipot*, is obtained from the turpentine yielded by *Pinus maritima* (see **PINE**), and consists almost entirely of an acid, isomeric with the preceding, and termed the *pinaric*. On evaporating its alcoholic solution, the acid is obtained in a semi-crystalline form; and on melting the mass thus obtained, and allowing it to cool, the resulting product is a colourless glass as clear as crystal.

Common rosin dissolves freely in alkaline solutions, and enters largely into the formation of yellow soap. The alkaline resinsates are, in point of fact, true soaps, but are inferior in their cleansing properties to the stearates, oleates, and margarates. All the above described acids of rosin are monobasic, soluble in ether and hot alcohol, and insoluble in water.

ROSS, SIR JOHN, C.B., Arctic voyager, born June 24, 1777, at Balsarroch, Wigtonshire, was a son of the Rev. Andrew Ross of Inch. He entered the navy at the early age of 10, was 15 years a midshipman, 7 years a lieutenant, 7 years a commander, and became a post-captain in 1818. When lieutenant of the *Serapis*, he was wounded in cutting out a Spanish vessel from under the batteries of Bilbao, in 1806. During the war, he was in three different actions. His more important services were rendered in the Arctic regions, whither, in 1818, he proceeded with Sir W. G. Parry. See **NORTH-WEST PASSAGE**. He published the results of his investigations in 1819. In May 1829, he was employed on a fresh expedition to the Arctic regions (fitted out at his own expense by Sir Felix Booth), and discovered the peninsula of 'Boothia Felix.' R. received, on his return, the honour of knighthood, and was made C.B. He received the freedom of London and other cities, gold medals from the Geographical Societies of London and Paris, was made a knight of various foreign orders, and received other acknowledgments of his services. In 1838, he was appointed British consul at Stockholm, where he remained some years. He was author of *Letters to Young Sea-officers; Residence in Arctic Regions, &c.* (1829—1834), 4to; Appendix to same, 4to; *Memoirs and Correspondence of Admiral Lord de Saumarez*, 2 vols. 8vo; *Treatise on Navigation by Steam*, 4to. He became a rear-admiral in 1851, and died August 30, 1856, at his house in Gillingham Street, Pimlico.

ROSS, SIR JAMES CLARK, Arctic explorer (nephew of the preceding), third son of George Ross, Esq., of Balsarroch, Wigtonshire, was born in London, April 15, 1800. He entered the navy in his 12th year, and served under his uncle in the Baltic, the White Sea, the coast of Scotland, and in all the naval expeditions for the discovery of the North-west Passage (q. v.) from 1818 to 1833.

It was while accompanying his uncle in his second Arctic voyage that he discovered, 1831, the North magnetic pole, and on his return he was rewarded with a post-captaincy. Afterwards employed by the Admiralty in a magnetic survey of Great Britain and Ireland, he, in 1836, crossed the Atlantic to relieve the frozen whalers in Baffin's Bay; and in 1839 he was placed in command of an expedition to the Antarctic seas (see **POLAR EXPEDITIONS**), and approached within 160 miles of the South magnetic pole. On his return in 1843, he received the honour of knighthood; and in 1847 he published his *Voyage of Discovery in Southern Seas, 1839—1843*. In January 1848, he made a voyage in the *Enterprise* to Baffin's Bay, in search of Sir John Franklin, but without success. He received the 'Founder's gold medal' from the Geographical Society of London in 1841, the gold medal of the Paris Society, and D.C.L. from Oxford in 1844. He died in 1862.

ROSS, a Celtic word, meaning a headland, occurring as the name or part of the name of many places in the British Islands, and in other parts of Europe, as Roslin, Culross, Rossberg, Ross (in England), Montrose, Roxburgh, Ardrossan. There is another Welsh root, *rhos*, signifying a moor, which is found in Welsh and Cornish names, as Rossall, Rusholme. In Roseness, in Orkney, the equivalent Teutonic term *ness* has been superadded after the meaning of the Celtic *ross* had been lost.

ROSS, a thriving market-town in Herefordshire, is finely situated on the left bank of the Wye, 14 miles south-south-east of Hereford. In the parish church (date 1316) is buried John Kyrle, celebrated by Pope as the 'Man of Ross' (q. v.). The town is well furnished with schools, carries on a trade in cider, malt, and wool; is much visited by tourists, and contained (1871) 3586 inhabitants.

ROSS AND CROMARTY, treated of in the 'Census of Scotland—1871,' as one Scottish county, is, as such, bounded on the N. by Sutherlandshire, E. by the German Ocean, S. by Inverness-shire, and W. by the Atlantic. Ross comprises the districts of Easter and Wester Ross, Ardmeanach, or the Black Isle, and the island of Lewis (q. v.). R. and C., in many parts, present a wild and mountainous aspect, intersected by beautiful glens, valleys, lakes, and rivers. Many of the mountains are of considerable altitude, the highest ranging from 3000 to 4000 feet, the most remarkable of which is Ben Wyvis. The high grounds afford excellent pasture for sheep and cattle, and the glens and low grounds, in the more favoured portions, are generally of a superior soil, which, with the fine climate, especially in Easter Ross, produce grain of a superior quality. There are numerous freshwater lakes and rivers. The principal loch is Maree (q. v.). There are several other lakes of considerable size, which altogether occupy an area of 90 sq. miles. There are numerous water-courses, the chief of which are the rivers Oikel and Conon, and several high waterfalls, the principal being Glomach, one of the finest in the kingdom. Limestone and ironstone are to be met with in abundance, as also granite and mica slate; and there are various mineral springs of note, the most famous of which is that of Strathpeffer. About the beginning of last century, the country in many places was nearly devoid of trees, but soon after, numerous plantations were formed, and many parts are now occupied by extensive forests. The lakes, rivers, and coast abound with fish, and the bays and sea-lochs being numerous, the fisheries are carried on extensively, occupying upwards of 22,000 persons.

According to the census of 1871, the area of the two counties is 3151 square miles, or 2,016,375

statute acres. The valued rental in 1674 was £6609; the valuation of 1873—1874 (exclusive of railways) was £239,288. The total acreage under all kinds of crops, bare fallow, and grass, in 1873 was 123,515; under corn crops, 47,741; under green crops, 23,092; clover, sanfoin, and grasses under rotation, 30,360; the permanent pasture, exclusive of heath and mountain-land, was 16,619. The number of horses used for agricultural purposes was, in the same year, 6743; the cattle counted 40,567; the sheep, 363,270; and the pigs, 5898.

The population of the united shires in 1871 was 80,955. The parliamentary constituency, which returns one member to parliament, is 1466 in number. The chief towns are Dingwall (q. v.), Fortrose (q. v.), and Tain (q. v.).

ROSS, THE MAN OF, a name given by Pope to John Kyrle, an English gentleman of great benevolence, who was born at Whitehouse, Gloucestershire, in the first half of the 17th century. Kyrle received his appellation from having resided during the greater part of his life in the small town of Ross, Herefordshire. He there spent his time and fortune in building churches and hospitals, which procured for him the love and veneration of his contemporaries. Kyrle may be considered the Howard of his age; and Warton, in his *Essay on the Writings and Genius of Pope*, has stated that he deserved to be celebrated beyond any of the heroes of Findar.

Pope, during his visits at the old mansion of Holm Lacy, the seat of Viscount Scudamore, near Ross, heard so much of Kyrle's beneficence, that in his *Moral Essays* he celebrates his praises under the name of the Man of Ross:

'Behold the market-place with poor o'erspread!
The Man of Ross divides the weekly bread;
He feeds yon almshouse, neat, but void of state,
Where age and want sit smiling at the gate:
Him portioned maids, apprenticed orphans blessed,
The young who labour, and the old who rest.'

We learn further, from the same poem, that the fortune of Kyrle was no more than £500 a year. Kyrle died in 1724, and was buried in the church of Ross.

ROSSANO, a city of Southern Italy, in the province of Calabria Citra, is situated at the foot of the Apennines, 2 miles from the Gulf of Taranto, on a high rocky hill, surrounded by steep precipices. It is walled and well-built, is defended by a castle, and contains a beautiful cathedral, inlaid with carved marbles. Its fields are very fertile, producing grapes and lemons. R. was laid waste by Totila, king of the Goths. Pop. 14,267.

ROSSBACH, a village in Prussian Saxony, in the government of Merseburg, and 8 miles south-west of the city of that name, is celebrated in history for the victory here gained by the Prussians under Frederick the Great over the combined French and Imperialist armies on 5th November 1757. A short time previously, Frederick had been compelled to leave the bulk of his army in Silesia under the Duke of Brunswick-Bevern to check the Austrians on this side, and hastened with 22,000 men to oppose the invasion from the west. The Prince of Soubise (one of the 'amateur' French generals of the period), who was at the head of the confederate army of 60,000 men, thinking from Frederick's cautious manoeuvres that he was terrified and desirous of retreating, at once charged forward with his cavalry, and left his columns at the mercy of General Seidlitz, who attacked them in front and flank with the whole of the Prussian cavalry and artillery. The confederates were speedily thrown into utter

disorder, and, being charged in front by the Prussian infantry under Prince Henry, their rout was complete. The 'rout of Rossbach' was so utterly disgraceful that it remained for a long time proverbial in the French army. The Prussians lost (according to a French account) only 300 men, while the loss of the allies was more than 1200 slain, 6000 prisoners, among whom were 11 generals and 300 officers, and 72 cannon, with many other trophies.

ROSSE, WILLIAM PARSONS, third EARL OF, a well-known practical astronomer, was born in York in 1800, and educated first at Trinity College, Dublin, and afterwards at Magdalen College, Oxford, where he graduated first-class in Mathematics in 1822. During the life of his father, he sat in the House of Commons as Lord Osmantown, representing Kincardine County from 1821 to 1831; he succeeded to the peerage in 1841, and was elected a representative peer for Ireland in 1845. At an early age he had devoted much attention to the study of practical science, and especially to the improvement of the telescope, and had commenced as far back as 1826 to make experiments in the construction of fluid lenses (see *Philosophical Transactions* for 1841), but he subsequently relinquished those investigations, to engage himself with the problem of the best mode of constructing the speculum of the reflecting telescope. The two great defects which had hitherto baffled opticians were 'spherical aberration'—the absorption of light by specula; and in the casting of these of large size, there was the apparent impossibility of preventing cracking and warping of the surface on cooling. However, by a long series of carefully conducted experiments, he succeeded in discovering a mode of operation by which the last defect was wholly obviated, and the two others greatly diminished in amount. The metal for the speculum of his great telescope (see TELESCOPE), three tons weight, was poured into the iron mould April 1842, the crucibles being lifted and emptied by means of cranes; and the mould was kept in an annealing oven for 16 weeks, so that the metal should cool equally. It was then polished and mounted in its park at Parsonstown, at a cost of £30,000, the adjustments consisting of a system of chains, pulleys, and counterpoising weights, so complex in all its parts, that the ponderous instrument of 12 tons' weight can be moved so as to point in any direction, and with almost as much precision as the ordinary equatorial of the observatory. The true addition to the body of astronomical knowledge made by this telescope was the resolution of certain nebulae, which had defied Herschel's instrument, at groups of stars; next came the discovery of numerous binary and ternary stars, and a description of the moon's surface. The construction of this telescope, which was wholly effected under R.'s personal direction and superintendence, is fully described in the *Philosophical Transactions*. He died October 1867.

ROSSETTI, GABRIELE, a celebrated Italian author, was born at Vasto in 1783, and came to England as a political refugee in 1824. Two years afterwards he published the *Comento Analitico* to the *Divina Commedia* of Dante, in which he aimed to shew that in the middle ages all the poets used a jargon under which they veiled their hatred of the papacy, and concealed the true religion under the form of a woman beloved by them. In conducting this argument he displayed amazing erudition. His opinions naturally excited a great deal of hostile criticism. R. replied to his opponents with the work, *Sullo Spirito Antipapale che predomina la Riforma, e sulla influenza che esercitò nella formazione di tutta l'Europa e principalmente d'Italia* (1830). But this book did not convince them

either, and then R. sought to reduce to method his system, and published *Il Mistero dell' Amor Platonico svelato* (1840), and *La Beatrice di Dante*. Whatever may be thought of R., he has at least founded a new school of interpretation of Dante, and his partisans are numerous in Italy. His name is well known in the peninsula for his national poems, which have gained for him the title of the Italian Tyrtæus. These are contained in the *Dio e l'Uomo* (1840); *Il Veggente in Solitudine* (1846); *L'Arpa Evangelica* (1852); *Poesie di Gabriele Rossetti* (1847). He was Professor of Italian Literature in King's College, London, and was honoured and esteemed by many of the most eminent public men in England. He died in London in 1864.

ROSSETTI, DANTE GABRIELE, son of the former, distinguished as a thoughtful and powerful painter, and as a faithful and elegant translator of early Italian poetry, was born in London in 1828, and educated at King's College, London. As a painter, he is more talked of than known, probably because his works are transferred into private collections as soon as they leave his studio, and without undergoing the publicity of exhibition. Although he has never exhibited at the 'Royal Academy,' his pictures are occasionally sent by their proprietors to various public picture-galleries. Of these, his 'Fair Rosamond,' a picture pervaded by earnest thought, and treated in a powerful, though strikingly unconventional manner, was exhibited in the galleries of the Royal Scottish Academy in 1860—1861, and may be taken as a good example of the artist's manner. Of his other pictures, the chief are 'Ecce Ancilla Domini,' and 'Beatrice Dead.' He contributed some fine drawings to an illustrated edition of Tennyson, which, although inadequately engraved, rank among the first of modern woodcuts. These, like everything this artist has produced, are strongly imbued with the spirit of the Romantic period. R.'s name was first brought prominently forward by his association with Millais and Holman Hunt in the 'Pre-Raphaelite Brotherhood.' In 1850, he was editor of *The Germ*, a magazine of poetry and art devoted to the furtherance of the views of the 'Brethren,' and to the inculcation of their fundamental principle, which was direct study from nature herself, unfettered by the conventionalities of the 'antique' and 'academies.' While time and experience have modified the practice of some of the original pre-Raphaelites, R.'s pictures still display the peculiarities of earlier days. As an author, R. is best known by his *Early Italian Poets from Ciuolo d'Alcamo to Dante Alighieri* (1100—1300—1300) (Lond. Smith, Elder, & Co., 1861). In this work, the translator achieves the rare success of not only catching the spirit of Dante, but of rendering the great poet in his own metres, and with a marvellous fidelity of thought and phrase. In conjunction with his brother WILLIAM, he edited *Goethe's Life of William Blake, Pictor Ignotus* (Lond. 1863), left incomplete at the death of the compiler. *Poems* (1870) added to R.'s reputation.

R. is not only a painter and author, but a man of thorough acquaintance with and high accomplishment in applied and decorative art. He bears a distinguished part in the resuscitation of Gothic art in England, both ecclesiastical and domestic, and is intimately associated with the now well-known firm of Morris, Marshall, and Faulkner, which bears to decorative art an analogous position to that occupied by the pre-Raphaelite school in relation to pictorial art.—CHRISTINA GABRIELLA ROSSETTI, sister of the above, and born about 1835, is the authoress of *Goblin Market and other Poems* (1862), *The Prince's Progress* (1866), to which works she owes a considerable literary reputation.

ROSSI, PELLEGRINO, was born of a noble family at Carrara in 1787. He carried on his studies at the university of Bologna. In 1812, being 25 years of age, he was appointed Professor of Law in that university. In 1815, King Murat having proclaimed Italian independence, R. sided with him. On the fall of Murat, R. was exiled. He took refuge at Geneva, where he was appointed Professor of the Science of Law. There he published *Le Droit Pénal*, a very learned work, which made him famous in France. In 1833, Louis-Philippe called him to Paris, and appointed him Professor of Political Economy. Then R. commenced the course *Du Droit Constitutionnel*, and the government, in order to reward the great publicist, naturalised him, and made him a member of the Chamber of Peers. Protected by Guizot, the prime minister, R. was sent to Rome as ambassador in 1845. There he witnessed all the events of 1848 and took part in them, having again become an Italian subject after the fall of Louis-Philippe. When called to the ministry by Pius IX., R. wished to oppose the party favourable to the House of Savoy, and devised an alliance with the king of Naples, which had for its object a confederation of Italian princes with the pope as their president. This roused the hatred of the Romans, and R. was stabbed by an unknown hand on the 15th November 1848. In 1860, Luigi Carlo Farini decreed the publication of all the writings of R., and that a bust of him should be given to the university of Bologna, where it was inaugurated with great solemnity on the 27th April 1862.—Besides the *Droit Pénal*, R. published the *Cours d'Economie Politique* (1840); the *Lettere d'un Dilettante Politico sull' Alemagna sulla Francia e sull' Italia* (Florence, 1848); and left many inedited writings, which, after his death, were published in Paris at the expense of the Italian government.

ROSSINI, GIOACCHINO, the greatest composer of the present century for the Italian lyrical stage. He was born at Pesaro in 1792, the son of a horn-player in an orchestra of strolling players. At the age of fifteen, the Countess Perticari, discovering his talent, sent him to study at the lyceum of Bologna, where he received instructions in counterpoint from Padre Mattei. He was, however, principally self-taught, giving days and nights to the study of the great Italian and German masters. Passing over a few juvenile efforts, his first important opera was *Tancredi*, which was first performed in Venice in 1813, and excited an extraordinary sensation throughout the musical world, raising its composer at once to the summit of fame. It was followed in succession by *L'Italiana in Algeri* (1813), *Il Turco in Italia* (1814), and *Aureliano in Palmira* (1814), all inferior to *Tancredi*. In 1815, R. was appointed musical-director of the theatre of San Carlo at Naples; and while holding that position he continued to produce operas both at Naples and elsewhere. *Il Barbiere di Siviglia*, the most popular of all his works, was produced at Rome in 1816, and said to have been composed in twenty days; it was followed by *Otello* in the same year; and in 1817, appeared *La Cenerentola* at Rome, and *La Gazza ladra* at Naples. From this time to the close of R.'s engagement at Naples in 1823, he wrote the operas of *Mosè in Egitto*, *La Donna del Lago*, *Maometto Secondo* (otherwise known as *L'Assedio di Corinto*) and *Zelmira*. In 1823, he produced *Semiramide*, the most gorgeous of his operas, at Venice, and soon afterwards left Italy. He visited first Paris, and then London, where he was received with great enthusiasm. Returning to Paris, he received from Charles X. the appointment of director of the Italian Opera in Paris, and while there composed his *Guillaume Tell* (1829),

which, though ill-constructed as a drama, ranks musically as high as any of his works. When the revolution of 1830 broke out, R. lost the management of the Italian Opera, but continued to live for some time in Paris; in 1836, he returned to Italy, where, with the exception of a visit to Paris, he principally resided till 1855. With *Guillaume Tell* he may almost be said to have closed his career, having after it composed nothing of importance except his well-known *Stabat Mater*, a pretty and popular work more secular than sacred in its style of music. Large offers from the managers of opera-houses did not succeed in tempting him from his retirement. His statue was inaugurated at Pesaro in 1864, amid a large concourse of Italian statesmen and men of letters. In R.'s early works he developed with great felicity the type established by his Italian predecessors. These compositions are characterised by stirring melody, brilliant instrumentation, and a highly enjoyable vivacity. *Guillaume Tell*, though equally original, approaches far more nearly to the character of the German school. Much as R.'s music continues to be prized, only four of his forty operas, composed from 1810 to 1829, have kept the stage, *Il Barbiere*, *Otello*, *La Gazza ladra*, and *Semiramide*. He died November 1863.

ROSSO ANTICO, the technical name for the red porphyry of Egypt. It consists of a red felspathic base, in which are disseminated rose-coloured crystals of oligoclase with some plates of hornblende, and grains of oxidised iron ore.

ROSTER (corrupted from Register) is a fixed order preserved in military departments as the rotation in which individuals, companies, or larger bodies are called on to serve. Regiments proceed on foreign service according to the roster.

ROSTOCK, the most important town and seaport of the grand duchy of Mecklenburg-Schwerin, stands in a flat fruitful district on the Warnow, 9 miles from the mouth of that river in the Baltic, and 55 miles north-east of Schwerin by railway. It is surrounded by ramparts and walls pierced by 12 gates, and has still a mediæval aspect. The university, founded in 1419, maintains 27 ordinary professors, and has a library of 120,000 volumes. The handsome new university building is a Renaissance structure in brick. In St Mary's Church, a large building dating from the 13th c., and possessing one of the finest organs in Germany, is the tomb of Grotius. St Peter's, dating from the 12th c., has a tower 420 feet high. There are several squares, of which Blucher's Square contains a colossal monument of the general of that name. Manufactures of linen and tobacco, and tanning, brewing, and distilling are carried on. In the year 1866, the town of R. owned 377 vessels. The exports are chiefly wheat, barley, oil-cakes, and cattle-bones to Great Britain. The imports are coals, salt, iron, limestone, herrings and other provisions, timber, &c. At the mouth of the Warnow is Warnemünde, the port of R., at which all vessels drawing more than 10 feet load and unload. Pop. of R. 32,000.—R. is of Slavic origin, and a shadowy glimpse of it is got in the 11th or 12 c., but the progress of commerce and other causes, chiefly political, rapidly Germanised it, and in 1218 it figures as wholly German. It was a member for centuries of the old Hanseatic League, long ranked in importance with Lübeck, and still enjoys to a wonderful extent its ancient privileges—the municipal constitution of the town being even yet almost wholly republican.

ROSTOF, a town of European Russia, and one of the most ancient in the empire, in the government of Jaroslavl, stands on the banks of Lake Nero or Rostofsky. An important fair is held here,

and a flourishing commerce, which the railway from Jaroslavl to Moscow promises to increase, is carried on. R. contains numerous factories, the chief manufacture being that of linen. Pop. 11,905.

ROSTOF ON THE DON, a district town and ferry of South Russia, occupies an elevated position on the right bank of the Don, and at the head of the delta of that river. It owes its origin to the foundation of the fortress of St Dmetri here in 1749, since which time the progress of the town, owing to its advantageous situation, has been so great that it is now the centre of trade in South Russia. Its custom-house was erected in 1835, and in that year the customs' dues amounted to £150,000. The annual exports have amounted to £1,198,530, the principal articles being wheat, iron, tallow, and linseed. Manufactures are carried on with activity in 22 factories, the principal articles produced being cast-iron, bricks, ropes, tobacco, macaroni, soap, &c. leather, amounting in value to £47,100. Pop. about 40,000.

ROSTOPCHINE, FEODOR VASSILEVITCH, Count, a Russian general, directly descended from Genghis Khan, was born in the province of Orel, March 2 1765; and, after having filled for some time the office of page to Catharine II., entered the Russian military service as a lieutenant in the Imperial Guard. In 1784 he set out on a course of foreign travel, returning to St Petersburg in 1792, and obtaining, through the powerful influence of some friends, the post of gentleman-of-the-chamber. Having it good fortune to be the first messenger to Paul of his accession to the throne, he was immediately (1796) created general, a rise in rank speedily followed by the successive appointments of grand-marshal of the court, minister of foreign affairs (1799), and chevalier of all the Russian orders. R. possessed extraordinary influence over the mind of the half-witted monarch, and succeeded in preventing his vagaries from seriously affecting the government or religion of the empire; but he was repeatedly banished from court and almost immediately recalled, and it was during the last of these banishments (to Moscow) that the czar was murdered. The Emperor Alexander seems to have disliked him, for R. remained in a state of banishment till May 1812, when, having need of the services of all his subjects, and knowing R.'s distinguished patriotism, Alexander appointed him governor of Moscow. On the approach of the French, R., by extraordinary exertions, raised an army of 122,000 men fully equipped, but to his great chagrin was ordered to evacuate Moscow. R. has been unanimously branded by the French writers as the burner of Moscow, and for a long time this was generally credited in the west till in 1823, he published in his own defence, *La Vérité sur l'Incendie de Moscou* (Paris, 1823), in which he rebuts the charge, affirming that this barbarous action was due in part to the fervid patriotism of a few of the inhabitants, and in part to the violence and negligence of the French. At the same time he shewed that the damage done to Moscow was much less than the estimate given by French and English writers, and that the Kremlin, which the French had attempted to blow up, had been in reality little injured. R. certainly set fire to his own mansion-house in the neighbourhood, but no other act of incendiarism has been proved against him, the accusations published in the *Broad Monitor* (1822) having been triumphantly refuted. He had succeeded in repairing much of the damage done to the city, and in re-collecting many of its former inhabitants, when, through a court intrigue, his dismissal from office was effected (August 3

1814). R. accompanied the Emperor Alexander to the Congress of Vienna, and subsequently (1817) retired to Paris, where he occupied himself in literary pursuits, and in forming a fine collection of pictures and books. In 1825, he returned to Russia, and died January 30, 1826, at Moscow. His wife and one of his sons have made for themselves names in literature, and his daughter-in-law, the Countess EUDOXIA ROSTOPCHINE, is considered as one of the first poets of Russia. R.'s works, which include a number of historical memoirs, comedies, &c., in Russian and French, were collected and published at St Petersburg in 1853.

ROT is known in the south-western counties of England under the provincial names of bane, coa, or coathe. It consists in the maturation within the liver and biliary ducts of an entozoon, the *Distoma hepaticum*, or Fluke (q. v.). Although most frequent amongst sheep, it also occasionally attacks rabbits, hares, deer, and cattle. Until of late years, the annual losses amongst the flocks of Great Britain were estimated at a million; but in 1809, 1824, 1830, and 1833, this large mortality is believed to have been doubled. During the wet winter of 1852—1853, and again in the autumn of 1860, and early months of 1861, rot was extensively prevalent. Autumn and early winter are the periods of its most frequent occurrence. Close damp weather, inducing a rapid growth of soft, luxuriant herbage, favours its development. The rising of the Nile is said to rot annually 16,000 sheep. Low, damp, marshy situations, water-meadows, undrained lands, especially when of a clayey, retentive consistence, furnish a large proportion of cases. The hay from such localities induces rot almost as readily as the fresh grass. Sheep grazed even for a few hours upon land subject to rot, or taking a single draught from an infected stagnant pool, may contract the disorder, most probably by swallowing the young flukes. From 15 to 40 days usually elapse before any serious consequences follow from the presence of the parasite. At first, indeed, digestion appears to be stimulated, and the sheep thrive rather better than before; but by and by they rapidly waste, their wool becomes dry, and easily detached, their bowels irregular, their skin and mucous membranes yellow, as is usually conveniently observed by examining the eye and its pearly caruncle, which in rot loses the brilliancy of health, and exhibits a dingy yellow hue. The body, after death, is soft, flaccid, and indifferently nourished; watery effusions are discovered underneath the jaws and in other dependent parts; the small quantities of unabsorbed fat have a dirty yellow colour; the liver is soft and enlarged, and usually mottled with patches of congestion. In the thick and muddy bile, the flukes, with their myriads of spawn, float in variable numbers.

The treatment of rot is seldom very satisfactory; and if the animals, when first affected, are in tolerable condition, no time should be lost in having them slaughtered. If remedial measures are attempted, the sheep should be removed to a dry and sound situation, and liberally supplied with dry nutritive food. During the summer, allow corn or cake with the grass; during the winter, when cases are most frequent, supply clover-hay, pease, or split beans, a little bruised linseed cake, and a few roots: pieces of rock-salt should also be laid about the ground, for the patients to lick at. Medicines are seldom of much avail. Those most to be relied on are turpentine and powdered gentian in two-drachm doses, given daily, beat up with an egg and a little milk, or with some linseed gruel. The turpentine, besides acting beneficially as a stimulant, doubtless also exercises a poisonous action on the flukes,

whilst the gentian imparts tone to the irritable and relaxed bowels. The prevention of rot is usually effected by removing from the land all superfluous moisture by deep and thorough drainage. The improvement of unsound herbage may subsequently be expedited by dressings of lime, salt, soil, or composts of farm-yard manure and earth. On all suspicious grazings, beans and oats should for a time be given in moderate quantity, and access allowed to rock-salt. The Arab and Bedouin shepherds have for centuries recognised the importance of such measures, for, when their flocks become rotten from depasturing on the rank herbage that shoots up after the risings of the Nile, they often prevent serious loss by promptly transferring them to the desert, where the dry forage-plants are very rich in saline matters. The Australian flock-master likewise checks the complaint by promptly removing his sheep, which have become tainted, from the deep alluvial soils to the poorer upland 'salt-brash' countries. In like manner, the salt marshes of Cheshire, and the saltings left along our coasts by the tides, have long enjoyed a well-deserved celebrity in the prevention, and even in early cases, in the cure of sheep-rot.

ROTANG. See RATTAN.

ROTATION (Lat. *rota*). There is, perhaps, no elementary idea which has been the subject of so much popular misconception as that of rotation. This is probably due to the vagueness of the definitions commonly given.

All motion that we can observe is *relative*; for instance, any fixed object on the earth's surface has a certain motion *relative* to the earth's axis, in consequence of the diurnal rotation; the earth itself has a certain motion *relative* to the sun, in consequence of its annual revolution; the sun has a certain motion *relative* to the so-called fixed stars; and it is possible that the whole stellar system may have a motion *relative* to something in space beyond its boundaries. Now, the motion of an object on the earth's surface differs according to the way it is measured: a passenger sitting in a railway-carriage is *at rest* if his motion *relative* to the carriage be considered; he has the same motion as the carriage, if it be measured *relative* to the rails; and if the carriage were running from east to west along a parallel of latitude, so as to complete the circuit in 24 hours, he would be *at rest* relative to the earth's axis. If, therefore, we wish to talk of *absolute* motion, it must be measured *relative* to *FIXED* points or directions; and in the violation of this obvious condition lies the error most commonly met with. Thus, to shew that the earth rotates about its axis, we may observe its motion *relatively* to the line joining it with the moon; and we observe that the moon comes to the meridian at intervals of (roughly) 25 hours. Does the earth rotate in 25 hours? We know that it does not, and the error consists in treating as an *absolute* rotation, a rotation measured *relative* to a line—that joining the earth and moon—which is itself turning. If we take the intervals of the sun's crossing the meridian, we find 24 hours—a much closer approximation; but still not exact, because our line of reference—that joining the earth and sun—is slowly turning. Would we have an *absolute* measure, we must choose a *fixed* line, or one so nearly fixed, that its motion is absolutely insensible. Such is the line joining any fixed star with the earth, and the time of the earth's *absolute* rotation about its axis is $23^{\circ} 56' 4.09''$ —the interval between culminations of the same fixed star. The difference between *absolute* and *relative* rotation in any planet gives rise to the difference between

ROTATION.

the *sidereal* and the *solar* day; and the planet's year contains just *one* more of the former than of the latter.

Now, suppose for a moment that the earth were to revolve only *with* part as fast as it now does, there would be *one* *sidereal* day in the year, and there would be *no* solar day at all—in other words, there would be *no* rotation of the earth with reference to the line joining it with the sun; that is, the earth would turn always the same side to the sun; yet it would be *absolutely* rotating about its axis once in a year. This is the case which we observe in the moon's motion relative to the earth, and we see at once that the moon must rotate *absolutely*—that is, with reference to fixed directions in space—in the exact time in which she completes one revolution about the earth. Those who say the moon does not rotate on her axis, make precisely the same mistake as those who fancied that the earth is immovable, and that moon, sun, and stars revolve about it every day. There is a physical cause for this peculiarity in the moon's motion, which leads to very important consequences with reference to the future of the solar system. See **TIDES**.

Several elementary theorems regarding rotation may now be enunciated; but the proofs, though very simple, will be given merely in outline. Any displacement *whatever* given to a plane figure in its own plane—as to a sheet of paper lying on a table—is equivalent to a single rotation about a definite axis. Let A, B be any two points of the figure, and let them be displaced to A', B' respectively. Join AA', BB', and bisect them in *a* and *b* by perpendiculars meeting in O. Then, it is easy to shew that (1.) OA' = OA, OB' = OB, and therefore

O is the *same* point of the plane figure in its first and second positions. (2.) $\angle AOA' = \angle BOB'$, and is therefore the angle through which the whole has turned about the point O. If AA' and BB' are parallel, this construction fails; but in this case, if AB and A'B' *do not* intersect, the motion is simply one of translation: if they *do* intersect, the point of intersection is the axis.

Any number of successive rotations about different points constitute, of course, a displacement, and are therefore reducible to one rotation.

Two equal and opposite rotations about different points give rise to a mere translation.

The first two of these propositions are true of figures on a sphere as well as on a plane surface; for the figure above has only to be drawn with great circles instead of straight lines, and the proof applies letter for letter. Only, here, the first case of exception cannot occur, because two great circles *must* intersect. Hence it follows, that if the centre of a sphere be fixed, any displacement *whatever* is equivalent to a rotation about some axis; that is, after any motion *whatever* of a rigid body, one point of which is fixed, there is *always* one line of particles which remains undisturbed. [This simple proposition has been found very hard to believe, even by men

of considerable intelligence.] Hence rotations about any number of axes passing through the same fixed point may be compounded into one; and, generally, any motion *whatever* of a rigid body may be decomposed into two, one of which is a motion of translation of some chosen point, and the other rotation about some axis through that point. Thus, in the case of the moon, we have a motion of translation of its centre in its orbit, and one of rotation about its axis; or we may combine them into a single rotation in the period of a lunar month about a fixed axis passing through the earth's centre.

Again, any displacement of a plane figure in a plane, or of a spherical figure on a sphere, may be produced by the rolling of a curve fixed in the figure upon another fixed on the plane or sphere. Hence the most general motion of a body with reference to one point, consists in the rolling of a cone fixed in the body upon another fixed in space, their vertices being at the chosen point. To this, when the cones in question are right circular cones, belong *Precession* (q. v.) and *Nutation* (q. v.) of the earth; and of a top, the evolutions of an ill-thrown quoit, &c.

ROTATION, MAGNETISM OF. This was discovered by Arago in the years 1824–1825. He observed that when a magnetic needle was made to oscillate immediately above a copper plate, it came sooner to rest than it did otherwise. The oscillations were made in the same time as when away from the plate, but they were less in extent; the plate seemed thus to act as a damper to the motion of the needle. This being the action of the plate at rest on the needle in motion, Arago reasoned that the needle at rest would be influenced by the plate in motion. Experiment confirmed his opinion. He made a copper disc revolve with great rapidity under a needle, resting on a bladder placed immediately above it, and quite unconnected with it, the middle of the needle being placed above the centre of the disc. As expected, the needle deflected in the direction of the motion of the disc. The deflection of the needle increased with the rapidity of the motion, and when it reached a sufficient amount, the needle no longer remained in a fixed position but turned round after the disc. This action of the revolving disc was attributed to what was then called the 'Magnetism of Rotation,' and the name has been since retained.

The explanation of this phenomenon was first made by Faraday (1832). He found it to arise from the reaction of currents, induced in the plate in motion by the magnet. The accompanying figure

Fig. 1.

illustrates the electrical condition of the plate. PP is the plate, rotating in the direction indicated by the arrow; NS, is the needle; and the lines with the arrow-heads indicate the general direction of the currents induced by rotation under the magnet in the plate. There are two complete circuits on each side of the disc, coinciding in the middle, and taking the direction CC'. It is the conjoined current which affects the needle; it runs in a direction a little in advance of the needle, as the inductive power of the magnet takes some time to act. As the induced current lies below the needle, it

ROTATION OF CROPS—ROTATORIA.

deflection (according to Ampere's rule,' see GALVANISM) takes place in the direction of the motion of the disc. When cuts are made in the disc in the line of the radii, it loses almost entirely its disturbing power; the currents formed in the whole disc can no longer take place, and those formed in the various sectors are weak in comparison; by filling up the vacant spaces with solder, the power is nearly restored to it. As is to be expected, the effect of the revolving plate depends on the conducting power of the material of which it is made.

It is owing to its high conducting power that copper is so much used in these experiments; hence, also, it is that copper should be so much used in the construction of magnetic apparatus. A copper compass-box, for instance, is not only desirable, from its being free from iron, but it acts as a damper to bring the needle quickly to rest when disturbed.

The magnetism of rotation is only one of a large class of phenomena, in which the motion, either of a magnet or of a conductor near it, induces an electric current in the conductor. We may here quote two experiments, which may be looked upon as the converse of the magnetism of rotation. In the first experiment, a small cube of copper (fig. 2) is hung by a thread to a frame, and placed between the poles of a powerful electro-magnet; the cube is sent into rapid rotation by the twist on the thread, previously given it; it is instantly brought to a halt, when the current is allowed to circulate in the coils of the magnet, and it begins its motion again when

the current is turned off. In the second experiment, a disc of copper, c, is made to rotate rapidly between the poles, n, s, of an electro-magnet, by means of a handle and intervening wheel-works, turned by the experimenter. When the current invests the soft iron poles with magnetism, the disc, moving freely before, appears suddenly to meet with an unseen resistance, and the rotation continues slowly or not at all. If persisted in, the rotation causes the disc to rise

Fig. 3.

in temperature, the rise being proportionate, according to Foucault, to the square of the velocity of rotation. These, and all similar phenomena, illustrate a law that holds universally in magnetic induction, and was first enunciated by Lenz. When a current is induced by the motion of a magnet or conductor, the inductive action tends to develop in the conductor a current, in such a direction that its action will be to oppose the motion producing it. Thus, in the last experiment, the part of the disc approaching the poles, has a current developed in it which repels them, and the part leaving the poles, has a current induced in it which attracts them. The approach of the one part, and the departure of the other, are equally opposed by the currents induced in them. The same mode of explanation applies to the other experiments referred to.

ROTATION OF CROPS. See **SUCCESSION OF CROPS.**

ROTATORIA, or ROTIFERA, popularly known as **WHEEL-ANIMALCULES**, derive their name from the Latin word *rota*, a wheel. They have received these names on account of the apparent rotation of certain disc-like ciliated organs which surround the mouth. Although some of the larger forms may be detected with the naked eye, they are as a class microscopical. They are widely diffused over the surface of the earth, inhabiting both salt and fresh water, and occurring in all climates. There has been much discussion as to their true place in nature. Ehrenberg regarded them as Infusoria, and Dujardin adopted a similar view. There is, however, no doubt that their organisation is far more complex than that of the Infusoria, and the main question of dispute at the present day is whether they are most closely allied to the worms or to the crustaceans. Huxley maintains that they form a link connecting the Echinoderms with the Nematoid (or thread) worms, and that they constitute the lowest step of the Echinoderm division of the Annelida; while Leydig endeavours to show that on various anatomical, physiological, and embryological grounds, they more nearly resemble crustaceans than worms, and proposes to call them *Ciliated Crustaceans*. Science is indebted to Leeuwenhoek for the discovery of this remarkable class of animals. In the *Philosophical Transactions* for 1702, he described one of the commonest of these animals, now known as *Rotifer vulgaris*, his attention having been especially directed towards its power of retaining its vitality after more or less complete desiccation—a fact which has been since confirmed by many other observers, and which is noticed in the article on **DORMANT VITALITY**. The R. have usually an elongated form, and are, in most cases, covered with a smooth hard skin, which is thrown into folds by the contractions of the subcutaneous tissue. The animal consists of a head and body. The body usually terminates in a prolongation, which, till recently, was termed the tail, but which is now known as the foot, and into which the intestines are never prolonged. The foot is composed of muscular and glandular structures, and often terminates in a pair of forceps, by which the animal can attach itself to leaves, &c. The body generally presents six segments, which are more or less distinctly marked in different genera. The head presents the characteristic rotatory organs and the mouth, which always lies in the midst of them, so as to receive particles drawn in by their whirlpool action. It is by means of these organs that they swim freely about, revolving on their axis, or when at rest, producing vortex-like disturbances of the water. The form, number, and arrangement of these organs varies extremely in different genera, and has been made a basis of classification by Ehrenberg and others. The rotatory organ may be single, double, or multiple. It often consists of a disc supported by a pedicle, on whose borders are successive rows of regularly arranged cilia, the motion of which gives the appearance of rotation to the disc itself. In the genera *Floscularia* and *Stephanoceros*, these organs undergo peculiar modifications. In the former, there are five or six button-like processes about the mouth, covered with very long bristles, which move feebly and scarcely give rise to vortices; while in the latter, the rotatory apparatus consists of five tentacle-like ciliated processes, and the animal thus closely resembles the Polyzoa (q.v.). The ciliated rotatory organs, unlike ordinary volatile cilia, are entirely under the animal's control. The digestive apparatus differs extremely in the two sexes, which are always distinct in these animals. In the female, the digestive apparatus is well developed, consisting

of a mouth opening into a muscular pharynx, which has two horny masticating organs which move laterally upon each other. The pharyngeal masticating apparatus is of a roundish form, and is composed of two jaws having one or several teeth, which are brought together laterally by the action of special muscles. For further information on the subject, the reader is referred to a very exhaustive memoir by Mr Gosse, 'On the Structure, Functions, and Homologies of the Manducatory Organs of the Class Rotifera,' in the *Philosophical Transactions* for 1856. Succeeding the pharynx is a narrow oesophagus, which leads into a dilated stomach, from which proceeds an intestine, which opens externally by an anus. In all the males that have been hitherto discovered, there is an entire absence of digestive organs, a rudimentary pharynx being the most that is ever observed. The nervous system in the R. consists of a cerebral ganglion, with filaments radiating from it. No heart or vessels have been discovered, but the respiratory organs are well developed. The sexual organs of the female are better known than those of the male. The ovary is round or oval, usually lies by the side of the stomach, and the oviduct proceeding from it usually opens into the cloaca. The ovaries only develop a few eggs at a time, and the nearly mature eggs may be readily observed in the body of the animal when examined under the microscope. These animals produce two distinct kinds of eggs, which are similar in their primary formation, but which differ in their ultimate destiny—namely, thin-shelled summer eggs, and thick-shelled winter eggs. The young are liberated from the former immediately after their discharge, while they remain unhatched in the latter during the winter weather. As far as has hitherto been observed, the males, which are much fewer in number than the females, are developed only from summer eggs. Except in regard to their being totally devoid of a stomach or intestine, and in relation to the sexual organs (which in the male have been carefully examined by Mr Gosse in his Memoir, 'On the Dicoecious Character of the Rotifera,' in the *Philosophical Transactions* for 1857), the organisation of the males is similar to that of the females. The sexes are, however, so unlike that they would be taken for widely remote genera, if their actual hatching had not been observed; the males and the eggs from which they spring being

Fig. 1.—Male Egg, just laid.

much smaller than the females and the eggs from which they are produced. (In *Brachionus amphicerus*, the female eggs were $\frac{1}{16}$ th of an inch in

Fig. 2.—Female Egg, nearly mature.

length, while the male eggs were only $\frac{1}{32}$ th). The accompanying figures represent the male and

female of *Brachionus dorsalis* when newly born. The length of the latter an hour after birth was $\frac{1}{16}$ th of an inch, while the diameters of the empty shell were only $\frac{1}{32}$ th \times $\frac{1}{32}$ th of an inch—a marvellous increase in so short a period. 'Whether,' says Mr Gosse, 'certain individuals produce only male, and others only female young, or whether separate impregnations are required for the production of the separate sexes, I do not know; but from all my observations I gather that the development of the one sex never takes place coetaneously with that of the other; for male and female eggs are never seen attached to the same parent, and the immature eggs in the ovary invariably develop themselves into the same sex as those which are already extruded. The duration of life in the male is always very brief; I have never been able to preserve one alive

Fig. 3.—Male *Brachionus dorsalis*.

Fig. 4.—Female *Brachionus dorsalis*.

for twenty-four hours. Their one business is to impregnate the females, and for this momentary occupation no supply of loss by assimilation of food is wanted, and hence we can understand the lack of the nutritive organism.'

ROTCHÉ (*Mergulus* or *Cephus*), a genus of the Auk family (*Alcidae*), separated from the true auks on account of the thick, short, and indistinctly grooved bill. The COMMON R. (*M.* or *C. melanoleucus*, or *M. alle*, formerly *Alca alle*), known also as the LITTLE AUK, and as the SKA DOVE and GREENLAND DOVE, is about the size of a large pigeon; its general colour is black, but the belly is white, and there is a white mark upon each wing. It is very abundant in the arctic seas, and immense flocks are seen on the coasts of Greenland, Spitzbergen, Melville Island, &c. It is, however, truly oceanic in its habits, and scarcely visits the land except during the breeding season. It is a rare bird on the British coasts. Under the article AUK will be found figures of the Great and Little Auks.

ROTHE, RICHARD, one of the first speculative divines of Germany, was born at Posen in 1799, and became successively member, professor, director, and ephorus of the Theological Seminary of Wittenberg. In 1837, he was nominated Professor of Theology at the university of Heidelberg, which in 1849 he exchanged for Posen. In 1854, however, he removed again to Heidelberg. Vigorous grasp and independence of thought were his chief characteristics, but he never formed a school, in the strict sense of the term. One of his well-known works is the *System of Theological Ethics, or Moral Theology*—a complete system of speculative theology or theosophy. This work is to shew that religious truth is not a series of disputable propositions, but a divine morality; in a word, to translate the scholastic dialect of the creeds back into the living language of the Sermon on the Mount. Another remarkable book of his is the *Beginnings of the Christian Church*, which, by the peculiarity of 'stand-point' assumed by the author regarding church and state, evoked many fierce counter-treatises, like Baur's *On the Origin of Episcopacy*. R. died at Heidelberg in 1867. His lectures on *Dogmatik* were published in 1870; *Sermons*, in 1872; and *Quiet Hours (Stille Stunden)*, the same year.

ROTHENBURG AN DER TAUBER, a small ancient town of Bavaria, on the Tauber, 31 miles south-south-east of Würzburg. Pop. 5382, who manufacture woollen cloth, paper, and gunpowder, and trade in corn and cattle.

ROTHERHAM, a market-town in the West Riding of Yorkshire, 6 miles east-north-east of Sheffield, is situated on the slope of a hill on the right bank of the Don, immediately below the junction of that river with the Rother. On the middle of the ancient stone bridge that crosses the Don is a Gothic chapel formerly used as a prison. The Free Grammar School, founded in 1564, and restored in 1858, and the court-house, are handsome buildings. In the neighbourhood are numerous coal and iron-mines, which furnish materials for the manufactures, the chief of which are stoves, grates, nails, and engines. Pop. (1871) 25,892. The Union Poorhouse, completed in 1839, is a spacious structure, capable of holding 314 inmates. The Union comprises 27 townships or parishes.

In the vicinity of R. are Roche Abbey, erected in 1147, and the masonry of which is still in a perfect state; and Conisborough Castle, a massive ancient stronghold, which is still in a good state of preservation, but which will survive its natural decay in Scott's *Ivanhoe*.

RO' THESAY, a royal burgh, seaport, and favourite watering-place of Scotland, capital of the county of Bute, is beautifully situated on the north-east shore of the island of that name, at the head of a deep bay, 40 miles west of Glasgow by the river Clyde. The bay offers safe anchorage in any wind, and is spacious enough to contain the largest fleet. Owing to its numerous excellent schools and seminaries, hotels, shops, and warehouses, R. presents all the advantages of a town, while the beautiful bay, and the charming scenery of the island, render it a favourite resort for sea-bathing and summer residence. The sheltered position, and the extreme mildness of the climate, have made it the resort of large numbers of invalids, especially such as are affected with pulmonary disease. Several cotton mills are in operation; fishing is the employment of a number of the inhabitants, and ship-building is carried on to a small extent, and at the pier nearly all the Clyde steamers to and from the West Highlands regularly touch. The harbour is commodious and solidly built. Pop. (1871) 7800,

which increases indefinitely during the bathing season. Within recent years, a very handsome promenade has been constructed. In the middle of the town are the ruins of Rothesay Castle, which first receives historical mention in 1263. It has remained in ruins since 1685. The Marquis of Bute has done a great deal to render this ruin a picturesque object to visit, and is at present (1874) clearing away some of the old houses which had been allowed to crowd too near it.

ROTHSCHILD, MEYER ANSELM, baron of the Austrian empire, was born in the Jews' Alley, Frankfurt-on-the-Main, in 1743, and died in 1812. He was brought up to be a priest of the Hebrew faith. Being a man of good character, he was employed by the senate to raise a loan in order to save Frankfurt from pillage by the French republican army. He obtained a loan from the Landgrave (afterwards elector) of Hesse Cassel. The landgrave acquired immense sums by selling his subjects to fight for England and France. Napoleon, after the battle of Jena, pronounced the forfeiture of his estates, and a French army was on the march to his capital. He had accumulated in his palace vaults about a million sterling in silver, and sending for R. to Cassel, he offered him the free use of the treasure, without interest, if he would convey it to a place of safety. With the aid of his Jewish friends, R. succeeded in secreting the money, and thus saved it from the hands of the French. At this time he had five sons, three of whom—Anselm, Nathan, and Solomon—being grown up, he associated with himself in business. ANSELM remained with him at Frankfurt. NATHAN came to England in 1800, where he acted as agent for his father, first at Manchester, in the purchase of Manchester goods for the Continent. He then removed to London, where by the agency of his father large sums of money were placed at his disposal, and invested by him with so much judgment, that his capital multiplied with great rapidity. He was appointed, by the interest of the landgrave, agent for the payment of the £12,000,000 sterling, which, by the treaty of Toeplitz, Great Britain stipulated to pay to her German allies. A large profit accrued to the house by this transaction. Previous to R.'s death (which occurred in September 1812), he saw his five sons securely established as the monarchs of European finance—Anselm in Frankfurt, Nathan in London, Solomon in Vienna, James in Paris, and Charles in Naples; all united in the wealthiest co-partnership of the present, or probably any other age. Nathan, in London, is said to have known the result of the battle of Waterloo several hours before the English government, and the knowledge is said to have been worth £200,000 to him. The loans contracted by the firm during the great war with France were not more remarkable for their magnitude than their success. They never took a bad loan in hand, and hardly any good loans fell into other hands. In addition to their five principal establishments they have agencies in many other cities both of the Old and New World. On two or three occasions the Rothschilds have successfully exerted themselves to preserve the peace of Europe. Their losses from the French revolution in 1848, and from the depreciation in the funds and securities which followed the subsequent disturbances in various capitals of Europe, were estimated at the enormous figure of £8,000,000 sterling—a wild estimate, but proving the popular belief in the immense resources of the firm. Nathan, after his father's death, was considered the chief of the family. The emperor of Austria made him a baron of the Empire in 1822. He died in 1836, at Frankfurt, whither he had been

called by the marriage of his eldest son, Lionel, to his cousin Charlotte, daughter of the Baron Charles. Anselm, Solomon, and Charles all died in 1856, the first-named dying childless at Frankfurt, and leaving a fortune valued at from 40,000,000 to 50,000,000 florins.—Baron LIONEL DE R., eldest son of Nathan, and head of the London house, was born in London in 1808, and educated at Göttingen. He was early initiated by his father into the business of the firm, and steadily and successfully applied himself to extend its colossal operations. He was elected for London in 1847, and at each election claimed to take the oaths and his seat in the House of Commons. The latter words of the oath—'on the true faith of a Christian'—he insisted upon omitting, 'as not being binding on his conscience.' He was then desired to withdraw from the House, and patiently awaited the fate of the bill of Jewish Emancipation, which usually passed the House of Commons, and was rejected by the Upper House. In 1858 he was, on the motion of Mr Duncombe, placed on a committee which was to hold a conference with the House of Lords, and this was virtually the means of establishing Jewish emancipation. The Commons sent up another bill, and a general belief prevailed that if it were, like the rest, thrown out by the lords, Jewish members would be admitted by resolution of their own House, instead of by act of parliament. The lords gave way, merely taking measures to prevent the admission of Jews into the upper chamber. Baron R. thereupon (July 1858) took the oaths and his seat amid the cheers of the House. He continued to represent the city of London till 1868, when he was rejected, but was re-elected in 1869. His brother NATHAN, and two or three other members of the Hebrew faith, have since been elected to the House of Commons. As the members of each successive generation are received into the copartnership, and the cousins usually intermarry, and as their immense wealth is being continually augmented by a profitable business, the name and operations of the firm, as public-loan contractors, dealers in bullion, and bill-discounters, promise to last as long as some royal dynasties.

ROTIFERA. See ROTATORIA.

ROTTENBURG, a town in Würtemberg, seven miles south-west from Tübingen, is situated on the Neckar. Pop. 5996. The castle, built in 1216, is now the House of Correction. In the neighbourhood are extensive hop-fields, orchards, and vineyards. The Roman station Sumelocennia stood on the site of R., and remains of roads and viaducts have been found.

ROTTENSTONE, a mineral consisting chiefly of alumina, with about ten per cent. of carbonaceous matter, and a little silica. It is supposed to be formed by decomposition of shale. It is found in Derbyshire, England, in Wales, and near Albany, in the state of New York. It is brown; either grayish, reddish, or blackish. It is soft, and easily scraped to powder, and is well-known to housewives, being much used for cleaning and polishing brass and other metals.

ROTTERDAM (dam or dike of the Rotte), after Amsterdam, the largest city in the Netherlands, and a place of great commercial activity, is situated at the confluence of the Rotte with the Maas, in the province of South Holland. It forms a triangle with the apex to the north, and the base stretching along the river, ships from all parts of the world discharging their cargoes in front of the Boompjes, a splendid row of houses shaded with trees. The Hoog Straat, built on the dam or dike formed to repel inundations, divides the city into the Binnenstad and Buitenstad, the

former being north of that line, the latter extending southward to the Maas. Broad canals or havens, full of shipping, cut the Buitenstad into islands, and lofty houses face the quays on either side. The largest canals are the Leuvenhaven and Oudehaven, which trend inward from the Maas, and the Scheepmakershaven, Wijnhaven, Blaak, Haringvliet, and Nieuwhaven, parallel with the river. R. is rapidly extending in all directions. The population has doubled within 50 years, and on January 1, 1863, it amounted to 111,403—the Protestants numbering 73,256; Roman Catholics, 33,747; and Jews, 4410. During 1862, the births were 4281; rather more than 7½ per cent. being illegitimate. Pop., January 1, 1872, 123,677, or 53,411 males and 65,266 females.

The industries are varied, including sugar-refining, gin-distilling, the making of liqueurs, beer-brewing, iron-founding, soap-boiling, the manufacture of vinegar, cigars, patent oil, sail and hair-cloth, articles of gold and silver, ship-building, &c. The works of the Netherlands' Steamboat Co., at Feijnoord, employ 700 men. The shipping trade is extensive, 2486 vessels arriving from sea-ports in 1863, and 2590 departing. Of these, 503 sailing, and 970 steam-ships, came from ports in Great Britain and Ireland; 845 sailing, and 970 steam-vessels clearing out thither. A large traffic is carried on with Germany, Belgium, and the interior of the Netherlands, the steam-boat entries alone being 8762.

Refined sugar is extensively exported. Large quantities of butter, cheese, yeast, madder, flax, &c. fruits are annually sent to Great Britain; and immense numbers of cattle, calves, swine, and sheep.

R. has railway communication with the other cities of the Netherlands, Germany, and Belgium. It is about 20 miles from the mouth of the Maas, the great commercial highway between the open sea and the Rhine provinces of Prussia. The municipal government consists of a burgomaster, 4 ward-holders (aldermen or bailies), and 34 councillors. R. has 4 Dutch Reformed Churches, 1 French Protestant, and 1 English Episcopal, 1 English Presbyterian, and 1 Scotch church, 6 Roman Catholic chapels, and 1 Jewish synagogue. The schools are good, and subsidised by the municipality. There are 3 for gymnastics; a normal school; a school for training boys for sea, with (1863) 129 pupils; a medical school, with 44 students; an institute for the deaf and dumb, at which 93 boys and 52 girls are educated by 15 teachers, 64 of the pupils being admitted free; a grammar school called the Erasmus; and several institutions for arts, sciences, architectural drawing, and music. The medical school has an anatomical museum; the Batavia Society possesses a good collection of philosophical instruments, books, and models. The Museum Boijmans, with many valuable paintings and work of art, was destroyed by fire in 1863. The Exchange, built in 1722, is a plain rectangular building of hewn stone. The hospital, on the Oude singel, a handsome erection, with excellent internal arrangements, January 1, 1864, had 225 patients. The St Laurence Church, built at the end of the 15th c., is a spacious building, resting on 11 Gothic pillars, and ornamented with a high truncated tower, the top of which is reached by 22 steps. It has a splendid organ, and several beautiful marble monuments, in honour of De Witt, Adriaan Kortenaar, and other distinguished men. A brass statue of Erasmus, stands on the Great Market, the house in which he was born is pointed out in the Breede Kerk Straat, which leads to the Great Church. The city has been added to and improved, and the water-way to the sea deepened and altered.

(the works completed in 1872), so as to avoid the hindrances to the navigation which are caused by the sand-banks at the mouth of the Maas.

RO'TTI, an island in the Indian Archipelago, belonging to the Dutch, lies to the south-west of Timor, between 10° 39'—10° 56' S. lat., and 122° 57'—123° 29' E. long.; pop. 75,000. Its greatest length, from east to west, is 36 miles, and the breadth from Termano, on the north, to Tilly, on the south, about 11 miles. The surface, though hilly, is nowhere more than 600 feet above the sea, and the fertile soil produces a rich vegetation.

The most valuable product is the Lontar palm, the wine or juice of which, either used fresh or thickened by boiling, and preserved in pots, forms a leading article of food. Next in importance is the Gabang tree, which bears large quantities of fruit, in size and shape like apricots, the fibre yielding a good tow, and the pith a sort of sago. Coco-nut, plantain, banana, and mango-trees are abundant. There is a great variety of timber trees, as beautiful ebony, mahogany, and several sorts well adapted for ship-building. The Rottinese plant millet, tobacco, rice, &c. R. is famed for a small but noble and hardy race of horses, which are bought for exportation at about £1, 6s. each. There are many buffaloes, sheep, goats, swine, deer, fowls, &c. Edible nests, tripang tortoise-shell, and wax are articles of export. Horses, swine, palm-wine, syrup, sugar, and native sail-cloth are exported to Timor, and cotton fabrics, cotton, beads, iron, iron-work, powder, guns, and arrack received in exchange.

The Netherlands' Missionary Society have made considerable progress in Christianising the natives, who are a fine-looking race, originally, it is thought, from Java. See *Land en Zeevogten in Nederlands Indië*, door Johannes Olivier; *Reis door den Indischen Archipel*, door L. J. van Rhijn.

RO'TTWEIL, a small town of Wurtemberg, on a declivity on the left bank of the Upper Neckar, 38 miles east-north-east of Freiburg in Baden. It contains a beautiful exchange, a number of interesting churches, and two powder-mills. Its manufactures are silk, cotton, and woollen fabrics, and its corn-market is one of the most important in the kingdom. Pop. (1872) 5135.

It is the site of an ancient Roman colony, among the ruins of which was discovered, besides a large number of other valuable antiquities, now preserved in the buildings of the gymnasium, a now well-known piece of mosaic work, upon which, among others, are an excellent drawing of Orpheus, and a number of profile drawings of the larger kinds of game, of chariot-races, and of gladiatorial encounters.

ROTUNDA, a building with circular exterior and interior, such as the Pantheon of Rome.

ROTURIER (according to Duncange, from *rupturarius*, a peasant; *ab agrum rumpendo*), one of the ignoble classes, who, during the early period of the feudal system, were separated from the high-born by almost as broad a line of demarcation as that which divided liberty from servitude. When the feudal theory of knight's-service came to be recognised as the only principle of gentle tenure, the term *roturier* came to be applied to the part of the population who continued to hold by the older or allodial tenure.

ROUBAIX, a flourishing manufacturing town in the north of France, in the dep. of Nord, and six miles north-east of Lille. It has risen into importance only in the present century. Numerous mills and factories, as well as dye-works and tanneries, are in operation. R. rivals Elbeuf and Louviers for woollen cloths and carpets, and vies

with Laval and the rest of Flanders in linen manufactures. Pop. (1872) 67,775.

ROUBLE, RUBLE, or RUBEL, the unit of the Russian money system. Pieces of peltrey formed, in early times, the ordinary medium of exchange in Russia; but about the beginning of the 15th c., silver bars came more and more into use for larger payments, and to make up intermediate sums, pieces of the bars were cut off. It was in this cutting off, in Russian, *rubat*, that the name rouble originated. The present silver rouble is equivalent to 3s. 2½d. sterling, nearly. Half, quarter, fifth, tenth, and twentieth parts of a rouble are also coined in silver; and gold coins of nominally five roubles (demi-imperials, really worth 5 roubles 15 copecs), and three roubles (imperial ducats) are also in circulation. The present Russian state paper-money is at par with the coinage. The rouble is divided into 100 copecs.

ROUEN (Lat. *Rotomagus*), one of the principal manufacturing and trading cities of France, and the capital of the dep. of Seine-Inférieure, is situated on the right bank of the Seine, 87 miles north-west of Paris by railway. The ramparts have been converted into spacious boulevards, which, as well as the quays that line the river-banks, are little if anything inferior to the boulevards and quays of Paris. The deep waters of the Seine form a commodious port, which is generally crowded with ships of all nations, from vessels of 300 tons to the smallest river-craft. A stone-bridge and a suspension-bridge connect the Faubourg St Sever, on the left bank of the river, with the city, which is at once one of the most picturesque and one of the busiest and liveliest places in France. Some of the streets are well and regularly built, with fine modern stone houses; but the greater part of R. consists of old, ill-built, but picturesque streets and squares, with tall, narrow, quaintly-carved, wooden-bound, and gabled houses. Among the many beautiful Gothic churches for which it is noted, the finest are the cathedral and the church of St Ouen. The former, one of the noblest metropolitan churches of France, is a remarkably fine specimen of Gothic architecture. It is built in a cruciform shape, and has two towers at the sides of the west entrance, and a lofty tower (464 feet high) terminating in a cast-iron spire, which was erected after the destruction by fire in 1822 of the old wooden belfry, which bore the date of 1544. It was erected by Philippe-Auguste between 1200 and 1220, and contains, in its 25 highly-ornamented chapels, numerous monuments of great interest—among others, those of Duke Rollo of Normandy, and his son, William Long-Sword. The heart of Richard Cœur de Lion is preserved, together with numerous other relics, in the sacristy. The church of St Ouen, which is almost as large as the cathedral, is one of the most interesting buildings in R.; and in its present restored state, presents a pure and elegant specimen of Gothic architecture. Among the other buildings of R., the finest are the Palais de Justice, belonging to the 15th c., and built for the parliament of the province; the Hôtel de Ville, with its public library of 110,000 volumes, and its gallery of pictures; and the Hôtel Dieu, one of the largest of its kind. R. has numerous benevolent, educational, and scientific institutions; and next to Lyon, is perhaps the most important manufacturing town in the empire. The principal branches of industry are cotton manufactures, including the checked and striped cottons specially designated as *Rouenneries*, nankeens, dimity, lace, cotton-velvets, shawls, &c. R. has also extensive manufactories of hosiery, mixed silk and wool fabrics, blankets, flannels, hats, cordage, cotton and linen

ROUGE—ROUGE ET NOIR.

yarns, shot, steel, lead, chemicals, paper, &c. Among other branches of industry, we may mention ship-building, and machinery in various departments. R. is the seat of an archbishop, a High Court of Justice for the department, a Tribunal of First Instance, and of Commerce, &c. Pop. (1872) 92,838.

History.—As the original capital in France of the Northmen, who took possession of it in 842, and settled there in accordance with the agreement which Charles the Simple was compelled to make with their leader Rollo, R. presents special points of interest to Englishmen. It was the residence of the dukes of Normandy till Duke William, in 1066, on his conquest of England, transferred the seat of his court to London; and, till the time of Richard Cœur de Lion, it continued to be the capital of Normandy, and was the seat of government of the Norman possessions of William the Conqueror's successors; but in 1204, it was taken by siege by the French king, Philippe Auguste, and annexed with the main part of the duchy to the French crown. During the wars of Henry V. and Henry VI. of England, it was under the power of the English from 1419 to 1449, when it was retaken by the French under Charles VII. It was during this temporary period of its occupation by the English, that the heroic Joan d'Arc was burned alive (1431) as a witch in the square of the city, in which stands her statue, and which is called in memory of her, Place de la Pucelle.

ROUGE, a preparation of safflower, used to give an artificial colour to the cheeks, and, when properly prepared, said to be perfectly innocuous to those who use it. The colour is obtained through a long and elaborate process, by precipitating it from the safflower, by means of citric acid or lemon-juice, on to prepared cotton. It is then washed out of the cotton with a solution of soda, and again precipitated with citric acid; but previous to adding the acid, finely-powdered French chalk is added to the solution, which becomes coloured, and falls down, when the precipitation takes place, giving the necessary body, and a peculiarly silky lustre to the colouring matter. *Jeweller's rouge* is a preparation of iron formed by calcining sulphate of iron or green vitriol, until the water of crystallisation is expelled; it is then roasted in a strong heat, and afterwards washed with water, until it no longer affects litmus paper. *Liquid rouge* is the red liquor left in making carmine.

ROUGE CROIX, one of the pursuivants belonging to the heraldic establishment of England, generally allowed to be the most ancient, although the period of institution is uncertain. The title is derived from the red cross of St George, the patron saint of England.

ROUGE DRAGON, the title of a pursuivancy founded by Henry VII., on the day before his coronation. The name is taken from the supposed ensign of Cadwaladr, the last king of the Britons, ancestor of that monarch. The red dragon was also sometimes used by Henry VII. as a supporter.

ROUGE ET NOIR (Fr. 'red and black'), **TRENTE-UN** ('thirty-one'), or **TRENTE ET QUARANTE** ('thirty and forty'), is a modern game of chance, which is played by the aid of packs of cards on a table covered with green cloth. The table is of a form similar to that shewn in the figure. It is divided into four portions, each marked in the centre with a diamond, the diamonds being alternately red and black; and these quarters are further separated, two and two, by bands which cross the table at its narrowest part. At the end of the table are a series of concentric bands painted of a yellow colour (not represented in the

figure). The game is played as follows: one of the *tailleurs* (or dealers, who manage the table, take charge of the bank, and keep an eye on the players takes up his position at one side of the table, opposite to the *croupier* (another *tailleur*), and unseal

Rouge et Noir.

in the presence of the players, six packs of cards, which are first counted, then shuffled by several *tailleurs*, and returned to the first *tailleur*, who presents them to one of the players to be cut. This is performed by the insertion of a blank card in any part of the pack, which is then adjusted, and the game proceeds. Each player must stake his money on some one of the four chances, denominated *noir*, *rouge*, *couleur*, and *l'inverse*, which will be afterwards explained. After the stakes have been laid on the table (those for the *noir* being laid on either of the quarters marked with a black; and those for the *rouge*, on either of the quarters marked with a red diamond; those for the *'couleur'* on one of the transverse bands; and those for the *'inverse'* on one of the yellow circles at the end of the table), the *tailleur* takes a handful of cards from the top of the pack, and deals first for the *noir*, taking one card after another from the top of the handful and placing them on the table side by side, till the number of pips on them amounts to more than 30, when he stops. He then deals out another row in a similar manner for the *rouge*, till, as before, the number of pips amounts to more than 30. In reckoning the number of pips, the ace is counted as one, the other plain cards according to the number of pips, and the court-cards 10 each. It will thus be seen that the number to which each of the two rows of cards amounts, must be more than 30 and not more than 40. If the value of the first row is nearer 31 than that of the second, then the first row, or *noir*, wins, if the contrary is the case, then the second row, or *rouge* wins. *Couleur* wins if the first card tabled by the *tailleur* is of the winning colour; thus, for instance, if the first card laid down is a 'spade' or 'club,' and if *noir* wins, but if the first card dealt be not of the winning colour, then *inverse* wins, and *couleur* loses. Two (and no more) of the four chances can be winning chances at one time; and the winning players have their stakes increased by an equal sum from the bank, and then withdraw their stake as winnings, while the stakes of the losers are taken by the *tailleurs* to the bank in the centre of the table. When the value of the first, or *noir* row, is equal to that of the second, or *rouge* row, it is a *refait*, and the dealer must commence to deal anew from the cards remaining in his hand; when the *refait* occurs, the player may either withdraw his stake, or stake on a different chance, with the same or more or less money as he thinks proper. The game of Rouge et Noir would be an even one between the players and the bank, were it not for the following regulation: When the points dealt for the *noir* and the *rouge* each amount to 31 (i.e.

ROUGH-CAST—ROULETTE.

refait de Trente-et-un'), the half of all the stakes on each of the chances belongs to the bank, and this the players may either pay or have their stakes 'put in prison,' the next deal determining whether they shall belong to the bank or be restored to the player. If a second doublet of 31 occurs in the deal immediately succeeding, the stakes which were in prison are diminished by one half, which goes to the bank, and the other half is 'put into the second prison,' from which it requires two successive winnings of the player to regain them. The chance of 'un refait de trente-et-un' is about once in 64 deals.

This game superseded *Faro* (q. v.) and *Biribi* in France about 1789, but along with *Roulette* (q. v.), was forbidden by law in 1838.

ROUGH-CAST, a kind of coarse plaster mixed with gravel, which is applied to the exterior of walls to protect them from the weather. It is also called *Harling* in Scotland, where it is much used.

ROULERS, a town of West Flanders, Belgium, 19 miles south-south-west of Bruges. In the vicinity flax is extensively grown, and in the town itself linen is largely bleached and manufactured. Pop. 11,200.

ROULETTE (Fr. 'a little wheel'), a game of chance which, from the end of last century till the beginning of 1838, reigned supreme over all others in Paris. It continued to be played at German watering-places till 1872, when it ceased in terms of an act passed four years before. R. is still played at Monaco, in Italy. As much as £8000 a year used to be spent in the papers of Paris alone advertising this game, which is purely one of chance, and is played on a table (see fig.) of an oblong form, covered with green cloth, which has in its centre a cavity, of a little more than two feet in diameter, in the shape of a punch-bowl. This cavity, which has several copper bands round its sides at equal distances from each other, has its sides fixed, but the bottom is movable round an axis placed in the centre of the cavity; the handle by which motion is communicated being a species of cross or capstan of copper fixed on the upper extremity of the axis. Round the circumference of this movable bottom are 38 holes, painted in black and red alternately, with the first 36 numbers, and a single and double zero, as shewn in the figure; and these 38 symbols are also figured at each end of the table in order that the players may place their stakes on the chance they select. Along the margin of the table and at each end of it are painted six words, *pair, passe, noir, impair, manque, rouge*, which will be afterwards explained. Those who manage the table and keep the bank are called *tailleurs*. The game is played as follows: One of the *tailleurs* puts the movable bottom in motion by turning the cross with his forefinger, and at the same instant throws into the cavity an ivory ball in a direction opposite to the motion of the bottom; the ball makes several revolutions, and at last falls into one of the 38 holes above mentioned, the hole into which it falls determining the gain or loss of the players. A player may stake his money on 1, 2, or any of the 38 numbers (including the zeros), and shews what number or numbers he selects by placing his stake upon them; if he has selected a number or zero corresponding to the one into which the ball falls, he receives from one of the *tailleurs* 36 times his stake—viz., his stake and 35 times more—if he selected only 1 number, 18 times if 2 numbers, 12 times if 3 numbers, &c. The blank rectangles at the bottom of each of the 3 columns of numbers figured on the table, are for the reception of the stake of that player who selects a column (12 numbers) as his chance, and if the ball

enters a hole the number of which is found in his column, he is paid 3 times his stake. Those who prefer staking their money on any of the chances marked on the edge of the table, if they win, receive double their stake (their stake and as much more), and under the following circumstances: The 'pair,' wins when the ball falls into a hole marked by an even number; the 'impair,' if the hole is marked odd; the 'manque,' if the hole is numbered from 1 to 18 inclusive; the 'passe,' if it is numbered from 19 to 36 inclusive; the 'rouge,' if it is coloured red; and the 'noir,' if it is coloured black. If the ball should

Roulette Table.

fall into either of the holes marked with the single or the double zero, the stakes of those players who venture upon the 6 chances last described are either equally divided between the bank and the players, or as is more commonly the case, they are 'put in prison,' as it is called, and the succeeding trial determines whether they are to be restored to the players or gained by the bank. Should it so happen that at this trial the ball again falls into one of the two holes (the chance against its occurring is 360 to 1) marked with zeros, then half of the stakes in prison are taken by the bank, and the remainder are 'put into the second prison,' and so on. The *tailleurs* thus have an advantage over the players

ROUND—ROUND TOWERS.

in the proportion of 19 to 18. The player who bets upon the numbers labours under a similar disadvantage, for although the two zero-points do not affect him in the same way as the player who stakes upon one of the other 6 chances, still (supposing him to bet upon a single number) as the chances are 37 to 1 against him, he ought to receive 37 times his stake (besides the stake) when he does win, whereas he only receives 35 times that amount, a manifest advantage in favour of the bank in the proportion of 37 to 35.

ROUND, in Music, a short vocal composition, generally of a humorous character, in three or more parts, all written on the same clef. Each voice takes up the subject at a certain distance after the first has begun. The second voice begins the first part when the first begins the second part, and the third takes up the first part when the second begins the second part, the whole ending together at the mark of a pause, ♩, or a signal agreed on.

ROUNDEL, or **ROUNDELLE**, was a shield used by the Norman soldiers.—The word is also applied to the semi-circular bastions in early fortification, as introduced by Albert Dürer. This bastion consisted of a semi-circle of masonry about 300 feet in diameter, containing roomy casemates for the troops, and for artillery and musketry, with which the ditch and curtains were flanked.

ROUNDHEADS, a name given by the adherents of Charles I., during the English Civil War, to the Puritans, or friends of the parliament, who distinguished themselves by having their hair closely cut to the head, while the Cavaliers (q. v.) wore theirs in long ringlets.

ROUNDLE, or **ROUNDLET**, in Heraldry, a general name given to charges of a circular form, which, in English heraldry, have more special names indicative of their tinctures. A roundle or is called

Roundle.

a *Bezant*; a roundle argent, a *Plate*; a roundle gules, a *Tortleaux*; a roundle azure, a *Hurt*; a roundle sable, an *Ogress* or *Pellet*; a roundle purple, a *Golpe*; a roundle sanguine, a *Guze*; a roundle tenney, an *Orange*. In the heraldry of Scotland and of the Continent, it is, on the other hand, usual to design all roundles of metal bezants, and those of colour torteaux, adding the tincture. Thus the coat blazoned in England azure three plates, would be in the Scottish mode of blazon, azure three bezants argent.

ROUND ROBIN, a name given to a protest or remonstrance signed by a number of persons in a circular form, so that no one shall be obliged to head the list. The round robin originated in France, and the name is derived from the words *rond*, round, and *ruban*, a ribbon. The officers of the French government first used the round robin as a means of making known their grievances; and the same method has occasionally been used in the public and other services of this country.

ROUND TABLE, KNIGHTS OF THE. See ARTHUR and NOVELS.

ROUND TOWERS. Tall narrow towers tapering gradually from the base to the summit, and found abundantly in Ireland, and occasionally in Scotland, are among the earliest and most remarkable relics of the ecclesiastical architecture of the British islands. They have been the subject of endless conjecture and speculation among antiquaries, who have connected them with pagan times and pagan rites; but the controversies regarding them have to a certain extent been set at rest by

the investigations of Dr Petrie; and there can be now no doubt that they are the work of Christian architects, and built for religious purposes. They seem to have been in all cases attached to the immediate neighbourhood of a church or monastery, and like other early church-towers (as older invention than bells), they served as symbols of dignity and power—while they were also capable of being used as strongholds, into which, in times of danger, the ecclesiastics, and perhaps the inhabitants of the country around, could retreat with their valuables. After the introduction of bells, they were also probably used as bell-towers. About 115 towers of this description are yet to be seen in Ireland—20 of which are entire or nearly so; and Scotland possesses three similar towers, at Brechin, Abernethy, and St Eglisay in Orkney. They are usually capped by a conical roof, and divided into storeys, sometimes by yet existing floors of masonry.

Round Tower, Devenish, Ireland.
(From Ferguson's *Hand-Book of Architecture*.)

though oftener the floors have been of wattle. Ladders were the means of communication from story to story. There is generally a small window on each story, and four windows immediately below the conical roof. The door is in nearly all cases at a considerable height from the ground. The subject of the woodcut represents the tower at Devenish, in Ireland, which may be considered as a typical example of the class. It is 82 feet in height, and furnished with a conical cap. A battlemented crown occasionally supplies the place of the conical roof, and in one instance the base of the tower is octagonal. Dr Petrie is inclined to think that a few of these remarkable structures may be as old as the 6th c.; but this great antiquity has been questioned by later writers, particularly Dr Daniel Wilson, who considers it is borne out by the character of the architectural details, and would assign them all to a period ranging from the 9th to the 12th centuries. The source whence this form of tower was derived, and the cause why it was so long persisted in by the Irish architects, are points which have not yet been cleared up. Two round towers, similar to the Irish type

are to be seen in the yet extant plan of the monastery of St Gall in Switzerland, of the first half of the 9th c.; and, in the Latin description attached to the plan, they are said to be *ad universa superspicienda*. The church and towers as rebuilt at that date are no longer in existence; but the latter were probably introduced in honour of the founder of the monastery, who was the leader of a colony of Irish monks, who, early in the 6th c., carried civilisation and religion into the fastnesses of the Alps. The form thus introduced became traditional in West Germany in the succeeding Romanesque style, where we have it reproduced with but little modification at Worms Cathedral and elsewhere. See Dr George Petrie's *Ecclesiastical Architecture of Ireland anterior to the Anglo-Norman Invasion* (Dublin, 1845); Dr Daniel Wilson's *Prehistoric Annals of Scotland*.

ROUP, a Scotch legal term synonymous with Auction (q. v.).

ROU'SAY, or ROWSA, one of the Orkney Islands, between the island of Westray on the north, and Pomona on the south. It is 4 miles long, 3 miles broad, is hilly, and covered with heath in the centre, but has a margin of fertile land along the shore. Pop. (1871) 860.

ROUSSEAU, JEAN JACQUES, a French author, celebrated not less for the singularities of his character, and the misfortunes of his life, than for the brilliancy and sentimental enthusiasm of his writings, was born at Geneva, 28th June 1712. The family to which he belonged, was of French origin, but had been settled for more than a century and a half in the little republican city, where his father Isaac Rousseau was a watchmaker. Deprived of his mother before he was a year old, R.'s infancy was tenderly cared for by a sister of his father's. At the age of ten he was placed, along with a cousin, under the charge of a M. Lambercier, Protestant pastor of Bossey, near Geneva, with whom he remained two years. At fifteen, a profession was chosen for him after considerable deliberation—that of *procureur* ('attorney'), and he was sent to a M. Masseron, to acquire a knowledge of engrossing, but that gentleman quickly dismissed him as a hopeless subject. In 1725, he was apprenticed to an engraver of Geneva, named Abel Ducommun, a harsh and violent man, from whose vulgar tyranny the sensitive and impulsive youth took refuge in flight (1728). Henceforth, to the end of his harassed and melancholy career, he was a wanderer; resting for a brief space in many homes, and making many friends, but always driven from the former, and robbed (or thinking himself robbed) of the latter. His first protector was a Madame de Warens, in Savoy, by whose exertions he was placed at a charity-school in Turin. Here, however, he felt himself so miserable that he ran off, lived ambiguously for some time 'with the wife of a soldier,' but in spite of his 'innocent passion' was very properly kicked out of doors by the irritated husband on his return; after which he became a lackey in the house of the Countess of Vercelli, where (as stated by himself in his *Confessions*) he stole a silk ribbon, and then accused a maid of the theft—in consequence of which both were dismissed. Finally, after certain vagabond adventures he returned to his protectress, but again fell into irregular courses, whereupon Madame de Warens conceived the amazing idea of rescuing the youth (who was now in his 21st year) from the temptations of vice by becoming his mistress herself. To preserve appearances, however, R. always addressed her as *Mamma*. In 1736, the two went to live at Charmettes, near Chambéry. Here R. fell into a state of hypochondria, and went to Montpellier to place himself under medical

treatment, but on his way thither fell in with a young lady whose charms quite dissipated all his morbid delusions. On his return he found that Madame de Warens had consoled herself during his absence by another lover, whereupon he betook himself to Lyon, and lived as a house-tutor for three years. Thence he proceeded to Paris in the autumn of 1741—under the conviction that he had made certain grand improvements in musical notation (of which in fact he hardly knew the elements), and read a paper on the subject before the *Académie des Sciences*, but was told that his 'improvements' were 'neither new nor practicable.' However, he managed to live here in an obscure way until he got the appointment of secretary to M. de Montaign, French ambassador at Venice. After a stay of 18 months in the city of islands, he returned to Paris, and finding his superior intolerable, became intimate with Diderot, Grimm, D'Holbach, and Madame d'Épinay, the last of whom, in 1756, provided a charming retreat for him in the vicinity of Paris, called the *Hermitage*, where he lived with a young girl of low origin, named Thérèse le Vasseur, who bore him five children, all of whom were sent by him to the Foundling Hospital—perhaps the most scandalous act of his strange life. R. afterwards married Thérèse, who seems to have been a faithful and affectionate creature of small capacity. The causes of his rupture with the clique of Parisian philosophers and fine women, have been the subject of envenomed misrepresentation in France, but from the thorough and accurate researches of M. Morin (see *Essai sur la Vie et le Caractère de J. J. Rousseau*, Paris, 1851), it turns out that R. was really the victim of an elaborate and odious conspiracy on the part of men who betrayed the confidence that he reposed in them. The conduct of Grimm was especially shocking. Driven from the Hermitage in 1757, he again found a temporary asylum with the Duke and Duchess of Luxembourg; but, in 1762, he found it necessary to retire to Switzerland, and fixed himself at Motiers-Travers in Neuchâtel, where he obtained the protection of Marshal Keith, then governor of that Prussian province. The intrigues of his enemies pursued him even thither, and after certain paltry persecutions, lay and clerical, he accepted the offer of David Hume to visit England, where he arrived in 1766. Misunderstandings, however, ensued with the Scotch philosopher, and in the following year he returned to France, and was installed in the castle of Trye by the prince of Conti. He did not remain long there, nor did he enjoy peace. Calumnies of the grossest kind were circulated against him, and once more he sought security in precipitate flight. In 1770, he reappeared in Paris, where he lived in obscurity, but not in tranquillity, for eight years, when M. de Girardin offered him a refuge at his estate of Ermenonville, near the capital, in the beginning of 1778, and here the unhappy R. died on the 2nd July of the same year.

R.'s personal character is a puzzle to moralists. There is no denying the vices and meannesses which stained it: these rest on the most unimpeachable testimony—his own. They are set forth with copious and melancholy sincerity in his *Confessions*, and the very incidents that lead us to condemn him most severely would never have been known to the world had he not chosen to reveal them. But he does not exculpate himself (as many suppose); on the contrary, he covers himself often with bitter and sad reproaches. On the whole, we are inclined to believe that he was, at bottom, an honest, warm-hearted, humane creature—free from guile, but full of a feminine jealousy, aggravated by long persecutions into a species of insanity; volatile, but not faithless; an erring, but withal a lovable mortal.

His grand defect was in strength of will. 'A man in convulsions,' says Carlyle, speaking of R. (*Heroes and Hero-worship*), 'is not strong, though six men cannot hold him;' and all through his spasmodic life, and the splendid sentimentalism of his writings, we are conscious of a 'forcible feebleness,' a want of genuine intellectual power and insight. His opinions in a philosophical point of view are valueless; men of any vigour or acuteness care nothing for his notions about the social contract—influential though they once were during that period of crazy enthusiasm and sham speculation, the French Revolution—nor for his shallow panegyrics on the 'Savage State;' but when he paints the emotions of a tender and voluptuous love, the rose-coloured charm of his genius is irresistible. The most famous of his productions are *Discours sur l'Origine et les Fondements de l'Inégalité parmi les Hommes* (Amst. 1755); *Julie, ou la Nouvelle Héloïse* (1760); *Du Contrat Social, ou Principes du Droit Politique* (Amst. 1762); *Emile, ou de l'Éducation* (Amst. 1764); and *Les Confessions, suivies des Réveries d'un Promeneur Solitaire* (Geneva, 1782; posthumous); but besides these he wrote a vast number of miscellaneous essays, letters, and treatises. His *Œuvres Complètes* have gone through innumerable editions.

ROUSSETTE. See **KALONG**.

ROUSSILLON, formerly a province of France, was bounded on the N. by Languedoc, on the E. by the Mediterranean, on the S. by the Pyrenees, and on the W. by the county of Foix. It now forms the French department of the Pyrénées Orientales. In ancient times the capital was *Ruscio*, which stood in the vicinity of Perpignan.

ROUT, one of the absurd names given to a fashionable evening assembly in London towards the end of the 18th and early part of the 19th centuries. At these entertainments, as many as 2000 to 3000 ladies and gentlemen were invited, and when the apartments were not sufficiently spacious for the company, temporary rooms were erected in the rear of the house, and elegantly fitted up. Crowded assemblies of this kind are now known as 'soirées,' or 'at homes.' For an amusing account of them, we refer to Mrs Stone's *Chronicles of Fashion*, vol. ii. p. 262.

ROUX. The name of a material used by cooks to thicken soups and gravies; it is made either white or brown. The former is prepared by putting a quantity of butter into a well-tinned stew-pan, and dissolving it gently over the fire. It is kept over the fire until it begins to simmer, when fine flour is dusted in with a dredge, and carefully incorporated, the flour being added until it is sufficiently thickened. It is then poured into a jar, and is ready for use. The brown is made in the same way, except that it is kept a longer time over the fire, which gradually gives it a rich brown colour.

ROVE BEETLE, or COCKTAIL (*Staphylinus*), a genus of coleopterous insects, the type of a family, *Staphylinidae*, to very many of which the same English names are often extended; belonging to the section *Coleoptera Pentamera*, and tribe *Brachelytra*, of which a chief characteristic is the short square elytra, which leave the greater part of the abdomen exposed. The abdomen is soft and flexible, and these insects have a habit of turning up the point of it, particularly when annoyed, whence the name *Cocktail*. They feed on carrion; their larvæ, however, not unfrequently choose vegetable food, as young wheat, cutting the stem underground with their strong mandibles. The bite of some of the species is apt to cause bad sores. The species are

354

numerous. Many of them have a fetid odour.

Rove Beetle (*Staphylinus olens*).

a, insect with tail cocked; b, insect with wings extended; c, head, magnified to show the opened jaws and the structure of the mouth.—(Copied from Morton's *Cyclopædia of Agriculture*.)

few have odours resembling those of fruits and flowers.

ROVEREDO, a city of Austria, in the Tyrol, occupies a most beautiful and picturesque site in the Lagerthal, on the banks of the Leno, and close to the left bank of the Adige, 12 miles south of Trento railway. R., one of the most flourishing towns in the Tyrol, is the centre of the silk-trade. It contains 60 factories, in which 2300 hands are employed, and carries on besides some trade in wax and an active transit-trade. Pop. 8000. R. was the scene of a battle between the French and Austrians on the 3d and 4th of September 1796, in which the latter were defeated.

ROVIGNO, a trading-town and seaport of Italy, stands on a rocky promontory which forms a deep harbour 45 miles south of Trieste. The best local wine is grown in the vicinity, which is also abundantly productive in oil. 30,000 casks of oil are exported annually; and ship-building, the wool manufactures to which a seaport gives rise, and the tunny and sardine fisheries, are the chief branches of industry. Pop. 14,000.

ROVIGO, a Venetian city in Italy, stands on the Adigetto, 38 miles south-west of Venice. It is a handsome fortified city; has a cathedral, and contains some fine paintings, and a picture-gallery. The staple produce of the neighbourhood is grain and wine. Pop. 9910.

ROVING. See **SPINNING**.

ROWAN TREE, MOUNTAIN ASH.

Rowan, or Mountain Ash (*Pyrus aucuparia*).

QUICKEN TREE (*Pyrus aucuparia*; *Sorbus*).

sucuparia of many botanists), a tree abundant in Britain, especially in the Highlands of Scotland, and in many parts of continental Europe. It does not attain a great size, has in general a very straight erect stem, and is distinguished from the other species of *Pyrus* (q. v.) by pinnated glabrous leaves, terminated by a single leaflet, serrated leaflets, corymbs of small flowers, and small globose fruit. The wood is valued for its compactness. The inner bark and sapwood have a very peculiar smell. In the superstitions of the Scottish Highlands, and also of the Lowlands, a peculiar importance was assigned to the rowan tree, a mere twig of which was supposed to have great efficacy in scaring away evil spirits. It is very ornamental, especially when in fruit. The fruit (*Rowan berries*) is sometimes used for preserves. It has much acidity, and a peculiar bitterness. It is generally red; but there is a variety with yellow fruit; and a very nearly allied species, *P. Americana*, a native of North America, has purple fruit.

ROWE, NICHOLAS, a dramatic poet and translator, the contemporary and friend of Congreve, Addison, Steele, and the other wits of the Queen Anne period, was the son of a serjeant-at-law, and was born at Little Barford, in Derbyshire, in 1673. He was educated at Westminster, and studied law in the Middle Temple; but inheriting a small competency by the death of his father, he devoted himself to literature. Between 1700 and 1714, he produced eight plays, of which three were long popular, viz.—*Tamerlane*, 1702; *The Fair Penitent*, 1703; and *Jane Shore*, 1714. The character of Lothario in the *Fair Penitent* was the prototype of Lovelace in Richardson's *Clarissa Harlowe*, and the same is still the synonym for an accomplished rake. R. translated Lucan's *Pharsalia*, and his translation was so highly valued, that after his death his widow received a pension expressly on account of this service to literature rendered by her husband. He was also the first editor of Shakspeare, 1709. The popular talents and engaging manners of R. procured him many friends, and he was appointed to several lucrative offices. The Duke of Queensberry made him his Under-secretary of State. In 1715, he succeeded Tate as poet-laureate; and the same year he was appointed one of the land-surveyors of the customs of the port of London; the Prince of Wales conferred on him the office of Clerk of his Council; and the Lord Chancellor Parker made him Clerk of the Presentations. He died December 6, 1718, and was buried in Westminster Abbey.

As a dramatist, R. is characterised by an easy and elegant style of diction and versification, but is destitute of originality, subtlety, or force in the delineation of character or passion. In the construction of his dramas, 'there is not,' as Johnson remarks, 'much art;' but there is no extravagance or gross violation of taste or decorum, and he excels in scenes of domestic pathos and tenderness.

ROXBURGH, a county in Scotland, comprising the districts of Teviotdale and Liddesdale, with part of Tweeddale, extending in length about 40 miles, and in breadth 28 to 30 miles, is bounded on the E. and S. by Northumberland and Cumberland; on the S.-W. by Dumfriesshire; on the W. by Selkirk; and on the N. by Berwickshire. The physical aspect of the county is varied and picturesque, having the Cheviot and Lauriston hills bounding a considerable portion of its borders. The Cheviots do not rise to any great height, the highest not exceeding 2000 feet. The herbage is green to the summit, and affords valuable pasture to sheep. The interior of the county is generally composed of good soil; and the farms being mostly large, and held by men of

capital and skill, it is farmed to the greatest advantage. The chief river is the Tweed, which flows through the northern districts of the county. The Teviot runs through the county a distance of 40 miles, and falls into the Tweed at Kelso. There are several other streams of note, the Allan, the Slitrig, the Jed, the Gala, &c.

R. possesses an interesting history in connection with border feuds of former days; and it has many magnificent remains of monastic life and institutions, which, with its many legends and traditional stories, render it of much interest.

The proprietors are not numerous—the Dukes of Roxburghe and Buccleuch, the Marquis of Lothian, the Earl of Minto, and a few others holding a great proportion of it. The area is 670 sq. m., or 428,494 acres. To the eye of a traveller, R. is the county of Perth in miniature. The valued rent of it in 1674 was £26,222 sterling; the new valuation for 1873–1874 is £405,700, including railways. In 1873, the total acreage under all kinds of crops, bare fallow, and grass, was 89,889; there was of wheat, 3244 acres; of barley, 15,293; of oats, 32,720; rye, 96; beans, 618; peas, 165. The total number of acres under corn crops was 52,136. The parliamentary constituency in the same year was 1813. Pop. (1861) 54,119; (1871) 53,965. The county town is Jedburgh.

ROXBURGHE CLUB, a society of very considerable literary interest, called after John, Duke of Roxburghe, the celebrated collector of ancient literature. After the death of the duke, who died in 1805, his valuable library, rich in the old romances of chivalry and early English poetry—a very fine treasury in its way—was, in 1812, brought to that hammer which almost always in an unmerciful manner scatters the gatherings of book-collectors, and the large prices realised for some of the books were unprecedented. As a specimen, it may be stated that a copy of the first work printed by Caxton in 1471, the *Recuyell of the Histories of Troye*, sold for £1050, 10s. The largest sum, however (and perhaps the greatest ever paid for a single printed volume up till that time), was given by the Marquis of Blandford (afterwards Duke of Marlborough) for the first edition of Boccaccio's *Decameron*, which fetched £2260. In commemoration of the interest which the sale of this collection occasioned among literary antiquaries, the R. C. was instituted, for the purpose of printing a limited number of impressions of MSS. and rare works for the use of its members, to whom they are strictly limited. The R. C. has in this way issued a series of 76 very curious and interesting works, which are only, however, to be found in the collections of the members, or in a few of the larger public libraries. On the anniversary (June 17) of the sale of the copy of Boccaccio's *Decameron* above referred to, the Club holds a symposium in London.

The R. C. may be regarded as the parent of many literary societies subsequently founded for similar purposes, among which may be mentioned the Camden, Percy, Shakspeare, Cheetham, Wharton, and Surtees Societies, in England; the Bannatyne, Maitland, Abbotsford, and Spalding Clubs, in Scotland; and the Celtic Society in Ireland. The labours of these bodies in printing MSS. and fugitive black-letter tracts have added many important contributions to British literature.

ROXBURGHIAEAE, a natural order of plants, belonging to the Dictyogens (q. v.) of Lindley, twining shrubs with reticulated leathery leaves; and large, showy, solitary, foetid flowers; the perianth of four divisions, the stamens four, hypogynous, the ovary one-celled, the ovules numerous;

ROXBURY—ROYAL FAMILY.

the pericarp one-celled, 2-valved, with two clusters of seeds at the base; the seeds attached to long cords. The species are very few, natives of the hotter parts of the East Indies. The stems of *Roxburghia viridiflora*, a native of Chittagong, the Malayan Islands, &c., are sometimes 100 fathoms long. The roots are boiled and soaked in lime-water, to remove their acidity, and are then preserved in syrup, and eaten.

ROXBURY, a city of Massachusetts, U.S., $2\frac{1}{4}$ miles from Boston, built upon hills, and in hollows, which give it fine building sites and attractive scenery. Besides numerous elegant residences, churches, schools, banks, and newspapers, it contains many forges, steam-engine and boiler-factories, cordage-mills, and manufactories of cotton, wool, carpets, flax-cotton, organs, starch, glue, &c. Pop. (1870) 30,000.

ROY, WILLIAM, major-general in the British army, was born May 4, 1706, at Milton Head, in the parish of Carlisle, Lanarkshire. His early history is quite unknown, and the incidents of his professional career comparatively unimportant, but his name will always be remembered by succeeding generations as that of the first of British geodesists. After the great rebellion in 1745, he was employed in preparing for government a map of the Highlands, and finally of the whole mainland, which, however, owing to imperfect instruments, and the hurried nature of the survey, was only, to use R.'s own words, 'a magnificent military sketch.' R.'s next important operation was the measuring a base line (see **ORDNANCE SURVEY**) on Hounslow Heath, of 27,404½ feet, or about 5½ miles, which, though the first measurement of the kind in Britain which pretended to accuracy, was executed with such care, that, on being remeasured after R.'s death, the difference between the two results was found to be only 2½ inches. For this splendid labour, R. received the Royal Society's Copley medal. R.'s labours connected with the survey extended from July 1787 till September 1788, when he returned to London in ill health, which necessitated his removal to the warmer latitude of Lisbon in the winter of 1789; but he returned to London in the following April, and died there 1st July 1790. In 1767, R. was elected a Fellow of the Royal Society, to whose *Transactions* he contributed, in 1777, a paper entitled 'Experiments and Observations made in Britain, in order to obtain a Rule for Measuring Heights with the Barometer.' He had also, during his survey of Scotland, paid particular attention to the camps and other Roman remains in that country, and had completed an elaborate work on this subject, illustrated by drawings and plans, and by a copy of his map of the country. This work was published (1793) by the Society of Antiquaries (of which R. had been a member), to whom it had been presented by R.'s executors. R. was also surveyor-general of the coasts of Great Britain.

ROYAL ACADEMY OF MUSIC, an institution founded in 1823, by a number of musical amateurs, headed by the Earl of Westmoreland, for the purpose of affording to a certain number of pupils the opportunity of obtaining a first-rate musical education, and of enabling those who make music a pursuit to provide themselves with the means of honourable livelihood. The Academy is chiefly supported by contributions and subscriptions, the subscribers and contributors being divided into four classes, of whom the first three recommend and elect the students. A small sum is voted yearly by parliament for its maintenance. Of the scholars, some are boarders and some out-door pupils. The pupils are placed under the tuition of

chosen instructors in every branch of musical education. The Academy was incorporated by royal charter in 1830. Since its foundation, a number of its pupils have gone forth to the world as musicians of eminence, including among others Sir W. Sterndale Bennett (who is now Principal of the Academy), Messrs G. A. Macfarren, A. Sullivan, Blagrove, Brinley Richards, Madame Saint-Dolby, Miss Loder, &c. Concerts are given by the pupils, to which the public are admitted. See Cazalet's *History of the Royal Academy of Music* (Lond. 1854).

ROYAL ASSENT. See **PARLIAMENT.**

ROYAL FAMILY. In its more restricted signification, the royal family of Great Britain includes the Queen-consort and Queen-dowager, and the children or other descendants of the sovereign. In a larger sense, it comprehends all the British descendants of the royal house, or perhaps, more properly, as indicated by Blackstone, all who may by possibility succeed to the throne. With regard to the position and rights of a Queen-consort and Queen-dowager, see **QUEEN**. The husband of the Queen-regnant is not as such a member of the royal family; but the style of Royal Highness, and a precedence next to Her Majesty, were conferred on the late Prince-consort by statute. The Prince of Wales (q. v.), or heir-apparent to the throne, and the Princess of Wales, are distinguished by law from the rest of the royal family. By the statute of Edw. III., to compass the death of the Prince of Wales, or violate the chastity of the Princess of Wales, is high treason. The eldest daughter of the sovereign is styled the Princess Royal, and a violation of her chastity is, by the same statute, high treason. The heir-presumptive to the throne has a special rank or precedence as such, as his position may be altered by the birth of an heir-apparent.

The younger sons and daughters of the sovereign are entitled to a peculiar place in the House of Lords; statute 31 Henry VIII. c. 10 enacts that no person except the king's children shall presume to sit or have place at the side of the cloth of estate in the parliament chamber. On a reference by George II. to the House of Lords regarding the position and precedence of Edward, Duke of York, second son of his son Frederick, Prince of Wales, it was held that, under the description of the king's children, grandsons are included.

On a reference made to all the judges by George I., it was resolved that the education and care of the king's grandchildren, when minors, and the approval of their marriages, belongs to the king, even during their father's lifetime. This care of approval has more recently been held to extend to the heir-presumptive, and it is difficult to say how far it comprises also the remoter branches of the royal house. There are frequent instances of the crown's interposition in the case of nephews, nieces, and a few in the case of more distant collateral. Questions regarding the marriages of the royal family are now further regulated by the Royal Marriage Act (q. v.). The Prince of Wales besides the revenues of the Duchy of Cornwall has settled on him, by 26 Vict. c. 1, an annuity of £40,000, and the Princess of Wales £10,000, to be increased to £30,000, in case of her widowhood.

On the consolidated fund are charged £25,000 to the Duke of Edinburgh, £15,000 to Prince Arthur, £8000 to Princess Frederick-William of Prussia, £6000 to Princess Ludwig of Hesse, £6000 to Princess Christian of Schleswig-Holstein, £6000 to Princess Louise, Marchioness of Lorne, £6000 to the Duchess of Cambridge, £6000 to her daughter, the Grand Duchess of Mecklenburg-Strelitz, £12,000 to

ROYAL GEORGE—ROYAL SOCIETY.

the Duke of Cambridge, and £5000 to Princess Teck, formerly Princess Mary of Cambridge.

ROYAL GEORGE, a British man-of-war, of 108 guns, the sudden sinking of which in Portsmouth harbour with all on board, 29th August 1782, created a widespread feeling of sorrow and commiseration. The R. G. was the principal vessel of Lord Howe's fleet, and while she was undergoing repairs near the keel, she was too much heeled over, so that the water rushing through the port-holes of the depressed side, speedily filled her, and she sank with all on board, including the admiral, Kempenfeldt, the captain, officers, crew, and about 300 women and children, who happened to be on board at the time—1100 in all. Of these, however, 200 were saved; but a small vessel, which happened to be anchored near, was drawn into the vortex occasioned by the R. G.'s descent, and swallowed up; and other vessels were also placed in imminent danger. Captain Waghorn, who escaped, was subsequently tried by court-martial for negligence and carelessness in the careening operation, but was acquitted. This calamitous event has been celebrated in an elegy by Cowper. Many of the guns were fished up soon afterwards, and several schemes were projected for the raising of the ship bodily, but without success, until, in 1839, the mass was blown to pieces by the explosion of large metal cases filled with gunpowder. Most of the valuables which had been in the ship were brought up, and the brass guns which were recovered sufficed to defray the cost of the operation.

ROYAL MARRIAGE ACT. Act 12 Geo. III. c. 2 enacts that no descendant of the body of Geo. II. other than the issue of princesses married into foreign families, shall be capable of contracting marriage without the previous consent of the sovereign, signified under the Great Seal; and any marriage contracted without such consent is declared void. But such descendants, if above the age of 25, may, after twelve months' notice given to the Privy Council, contract and solemnise marriage without consent of the crown, unless both Houses of Parliament shall, before the expiration of the year, expressly declare their disapproval of such intended marriage. The penalties of *Præmunire* (q. v.) are attached to all persons who shall solemnise, assist, or be present at any such marriage. This act was passed in consequence of the marriage of the Duke of Gloucester, brother of George III., with the Countess Dowager of Waldegrave, and of the Duke of Cumberland with the widow of Colonel Horton and daughter of Lord Irnham. The marriage of the late Duke of Sussex in 1793 to Lady Augusta Murray, daughter of the Earl of Dunmore, was declared by the Prerogative Court to be a violation of the Royal Marriage Act, and therefore null and void, in August 1794; and the claims of their son, Sir Augustus d'Este, were declared invalid by the House of Lords in 1844. The Royal Marriage Act is heartily disapproved by many as impolitic and despotic, and as tending to immorality and scandalous conduct, and was not passed without great resistance in parliament. But the influence of the government was then too strong for public opinion.

ROYAL-MAST, the fourth mast from the deck, and usually the highest carried. It is most commonly made in one piece with the top-gallant-mast. It carries the royal-yard, which bears a sail called the 'royal.' The royal-mast is surmounted by the truck, at which the pendant or other flag is displayed when necessary.

ROYAL SOCIETY (OF LONDON). The origin of this Society may be traced back to those stirring years of civil strife that brought in the Commonwealth. Clubs for political, theological, and sec-

tarian purposes were then numerous and active; and in the year 1645, 'divers worthy persons, inquisitive into natural philosophy, and other parts of human learning, did, by agreements, meet weekly in London on a certain day, to treat and discourse of such affairs.' Among these worthy persons were certain medical men, Dr Wilkins, afterwards bishop of Chester; Foster, professor of astronomy in Gresham College; Wallis, the mathematician; and others, including a learned German from the Palatinate; and out of their meetings arose the now world-famous Royal Society. Wallis records that the subjects discoursed of were 'the circulation of the blood; the valves in the veins; the *venæ lacteæ*; the lymphatic vessels; the Copernican hypothesis; the nature of comets and new stars; the satellites of Jupiter; the oval shape of Saturn; the spots in the sun, and its turning on its own axis; the inequalities and selenography of the moon; the several phases of Venus and Mercury; the improvement of telescopes, and grinding of glasses for that purpose; the weight of air; the possibility or impossibility of vacuities, and nature's abhorrence thereof; the Torricellian experiment in quicksilver; the descent of heavy bodies, and the degrees of acceleration therein; and divers other things of like nature.'

In 1662, the persevering philosophers were, through the 'grace and favour' of Charles II., incorporated by charter, in which they were described as the Royal Society of London for the Promotion of Natural Knowledge. The king gave them also a mace, and subsequently granted two other charters conferring additional powers and privileges. They are inscribed in a handsome volume known as the Charter Book, which, containing, as it does, the sign-manual of the founder, of other royal personages, and of nearly every Fellow elected into the Society, presents a collection of autographs unequalled in the world.

Through many difficulties, the young society pursued their way. Their meetings were interrupted by the great fire and the plague; but in March 1664—1665, they published the first number of the *Philosophical Transactions*, and thus commenced a record of their labours and researches, and at the same time a history of science of the highest value, comprising now (1874) one hundred and sixty-three quarto volumes. Besides this, the Society publish an octavo serial entitled *Proceedings*, in which an account of the ordinary meetings is set forth. This was commenced in 1800, and is now in the twenty-second volume. Another publication, in six large quarto volumes, is the *Catalogue of Scientific Papers*, containing the titles of scientific papers published in all parts of the world from 1800 to 1863. This great work, invaluable for purposes of reference, was compiled at the cost of the Society, and they are now continuing the compilation for the ten years 1864—1873. These works are not restricted to the Fellows, but are sold to the general public.

By increase of numbers—including scientific men on the continent, who were elected as foreign members—the Society widened their sphere of usefulness. They promoted the publication of Newton's *Principia* and optical works; they lent instruments to Greenwich Observatory in its early days, and were appointed visitors of that establishment by Queen Anne—a function which they still exercise; they aided travellers and scientific investigators; through force of circumstances, they became the advisers of the government on scientific subjects; Cook's celebrated voyage to observe the transit of Venus was undertaken at their instance; and from the voyage of the *Endeavour* down to the voyage of the *Challenger*, it would be difficult to

and is thus the most electro-positive of the known elements.

We have included the notice of Cæsium with that of R. in this article, because its recent discovery prevented it from being considered in its proper alphabetical place. For the same reason, we may here briefly notice another metal, INDIUM, similarly discovered during the last two years, by Reich and Richter, in the Freiburg arsenical ores. Its most striking property, and that which led to its discovery, is the indigo-blue line which all its compounds (in so far as they have been investigated) shew in the spectroscope. Its eq. is 37, its sp. gr. varies from 7.1 to 7.3; its colour is between that of tin and silver; it is exceedingly soft and very ductile; and its fusing-point is about that of lead.

RUBRICS (Lat. *rubrica*, from *ruber*, red), in classic use, meant the titles or headings of chapters in certain law-books, and is derived from the red colour of the ink in which these titles were written, in order to distinguish them from the text. In mediæval and modern use, the name is restricted to the directions which are found in the service-books of the church, as to the ordering of the several prayers, and the performance of the sometimes complicated ceremonial by which they were accompanied. The same name, together with the usage itself, is retained in the Church of England Prayer-book; and in all these, even where the direction has ceased to be printed in red ink, the name rubric is still retained. Where red ink is not employed, the rubric is distinguished from the text by italics, or some other variety of print. In the Catholic Church, a considerable controversy exists as to whether the rubrics of the missal, the ritual, and the breviary, are to be considered preceptive, or only directive—a question into which it would be out of place to enter. A similar controversy has existed at various times in the English Church. The science of rubrics is with Catholics a special branch of study, the chief authorities on which are Gavanti, Merati, Cavalieri, and other more compendious writers.

RUBRUQUIS, WILLIAM DE, one of the most distinguished of mediæval travellers, was born early in the 13th c.—probably about 1228. He entered, while very young, into the Franciscan order, and being hindered in his favourite scheme of missionary labour in the Holy Land, he was sent by Louis IX. of France into Central Asia, for the purpose of forming an alliance with Sartach, the son of Batû Khan of Kiptchak, a supposed Christian sovereign, against the infidels who held the Holy Land. Taking Constantinople as the starting-point, R., with two companions, also Franciscans, sailed for Soldain—now Soujac—near Cherson, made his way across the steppes between the Dnieper and the Don, and crossing the latter river, reached, August 2, 1253, the camp of Sartach, who was now discovered not to be a Christian, and by whom they were sent forward to his father, Batû. When they reached the encampment of Batû, on the Volga, near its mouth, that prince refused to treat with them, and sent them forward to the Tartar emperor, Mangû Khan, whom they reached on the 27th December. At this rude court they remained for several months, and accompanied it about Easter to Kara-korum, where they found a few Europeans. Some time afterwards, R., being charged with having spoken of the emperor as an infidel, although he defended himself courageously, was compelled to return, but was treated with a certain degree of rude consideration. Proceeding along the banks of the Volga, he penetrated the difficult defiles of the Caucasus, proceeded through Armenia, Persia, and Asia Minor, to Syria, arriving at Tripoli in August

1255, having spent two years and a half in his eastern travel. As King Louis, by whom the mission had been accredited, had meanwhile returned to France, R. requested permission to follow him, in order to report the result; but fortunately for science, the Franciscan provincial refused to permit him to leave the East, and directed him to report in writing. To this fortunate severity we owe the interesting and curious account which he drew up, and of which a lucid summary will be found in Lardner's *Cyclopædia, Inland and Maritime Travels*, vol. i. p. 261, and following. Of the later history of R., the only fact known is, that he was still living in 1293, when Marco Polo was returning from the East. His narrative is among the most plain and sober in its tone of all that have come down to us from the adventurous voyagers of the 13th century.

RUBUS, a genus of plants of the natural order *Rosaceæ*, suborder *Potentilleæ*, distinguished by a 5-lobed calyx without bracts, and the fruit formed by an aggregation of small drupes adhering to each other upon a long *torus*. The fruit is eatable in all, or almost all, the species, which are very numerous, and natives chiefly of the colder parts of the northern hemisphere, although some are natives of warm climates, and are occasionally to be seen in our hothouses. Some of them are herbs with perennial roots, some are shrubs with subligneous—often (e.g. biennial—stems, and they have digitate, pinnate, or lobed leaves. They cause great difficulty to botanists, the varieties being extremely numerous, and the specific distinctions very uncertain. The RASPBERRY (q. v.) and BRAMBLE (q. v.) are well-known fruits. The CLOUDBERRY (q. v.) also belongs to this genus. Besides these, and the species most nearly resembling them, and which have been described along with them, notice may be taken of *R. spectabilis*, a shrubby species, with leaves of three leaflets, and fine large dark purple fragrant flowers produced singly on long terminal flower-stalks. It is native of the banks of the Columbia River. The fruit is about the size of a raspberry, dark yellow acid, and somewhat astringent, making excellent tarts.—*R. saxatilis*, sometimes called the *Strawberry Bramble*, is a perennial herbaceous plant, with slender stem, leaves of three leaflets, small greenish-yellow flowers, and pleasant fruit of very few large drupes. It is a native of stony places in mountainous parts of Britain.—*R. arcticus* is a small herbaceous plant with creeping roots, slender stems 2–6 inches high, each with three or four leaflets which have three leaflets; the flowers large and deep rose colour, and a purplish red fruit of exquisite flavour. This interesting plant is a very doubtful native of the Highlands of Scotland, but is very abundant in Norway and Sweden, Siberia, and other arctic countries. In Siberia, it is known by a name signifying *Prince-berry*. A syrup, jelly, and a wine are made of it. The fruit is highly esteemed; but although the plant grows very well in our gardens, it seldom bears fruit.

RUBY, a gem much prized, and only inferior in value to the diamond, or perhaps also to the emerald. It is regarded by mineralogists as a distinct species, but as a mere red-coloured variety of Sapphire (q. v.) or of Spinel. The *Bala* is a rose-red. The Almandine R. is tinged with violet or brown. The finest red rubies are generally known as *oriental rubies*, and are indeed brought from the East, chiefly from Ceylon and the Burmah empire. The best generally come from the neighbourhood of Syriam, in Pegu. In Ceylon, rubies are found in remarkable abundance in alluvial deposits, which have been searched for them for ages, and the natives seem never to have thought of dig-

in the rock of the mountains; but Dr Gygas found innumerable small rubies, in a state of decomposition, falling to powder, in a stratum of gray granite with iron pyrites and molybdena; and Sir James E. Tennent thinks that mines might be opened with confidence of success. Sir Alexander Burnes describes a ruby-mine at Badakshan, in Bactria. Tavernier states that the throne of the Great Mogul was adorned with 108 rubies, of from 100 to 200 carats each. The king of Arracan is said to have possessed a R., in the form of a six-sided prism, about an inch in diameter, terminated by a six-sided pyramid. But the greatest R. ever heard of was that possessed by the king of Ceylon, which, according to Marco Polo, was a span in length, as thick as a man's arm, and without a flaw. Kublai Khan sent an ambassador to demand this R., offering the value of a city as its price; but the Ceylonese monarch refused to sell it. What has become of it is not known.

RÜCKERT, FRIEDRICH, a German lyric poet, was born May 16, 1789, at Schweinfurt, and died in January 1866. He received his education at the gymnasium of his native town, and studied at Jena University. In 1826, he was nominated Professor of Oriental Languages at Erlangen; went in 1840 to Berlin, as professor and privy-councillor, but resigned that position in 1849, and lived on his estate of Neuses in Coburg. R. began his literary career under the pseudonym of Freund Raimar with his *Deutsche Gedichte* (German Poems, Heidelb. 1814); and *Napoleon, eine politische Komödie in drei Stücken* (Napoleon, a Political Comedy in three Parts, Stuttg. 1816). Under his own name he published: *Kranz der Zeit* (A Wreath of the Time, Stuttg. 1817); *Oestliche Rosen* (Eastern Roses, Leip. 1822); *Gesammelte Gedichte* (Collected Poems, 6 vols., Erl. 1834—1838). As fruits of his oriental studies are to be considered his translations of Hariri's *Makamen*, under the title *Die Verwandlungen des Abu-Seid* (The Transformations of Abu-Seid, 2 vols. Stuttg. 1826); of the Indian tale, *Nal und Demajanti* (Frank. 1828); *Hamasa, oder die Aelteste Arabische Volkslieder* (Hamasa, or the oldest Arabic Ballads, 2 vols. Stuttg. 1846); and *Amrilaikais der Dichter und König* (Amrilaikais, the Poet and the King, Stuttg. 1847). Original poems of R., also relating to the East, are: *Morgenländ. Sagen und Geschichten* (Eastern Tales and Stories, 2 vols. Stuttg. 1837); *Erbauliches und Beschauliches aus dem Morgenländ* (2 vols. Berl. 1837); *Rostem und Suhrab* (Erl. 1838); *Brahmanische Erzählungen* (Brahmanic Tales, Leip. 1839); *Die Weisheit des Brahmanen, ein Lehrgedicht in Bruchstücken* (The Wisdom of the Brahman, a Didactic Poem in Fragments, 6 vols. Leip. 1836—1839); *Leben Jesu* (The Life of Jesus, Stuttg. and Tüb. 1839). The titles of his dramas are: *Saul und David* (Erl. 1843); *Herodes der Grosse* (2 vols. Stuttg. 1844); *Kaiser Heinrich IV.* (2 vols. Frank. 1845); *Cristoforo Colombo* (2 vols. Frank. 1845). R. was one of the most learned, versatile, and sprightly lyricists of modern times. He tried all sorts of metres, the Greek hendecasyllabic, the old Norse alliterative verse, the old German couplet, the *Nibelungen* strophe, the popular ballad, the delicate yet stately measure of the eastern gazelle (sonnets), and every kind of European quatrains, distiches, &c.; and he succeeded in all. Perhaps his fancy and wit were more remarkable than his depth of lyric feeling, yet the simple pathos of such pieces as the *Aus der Jugendzeit* could hardly be surpassed.

RUDD. See RED-EYE.

RUDDER, in a ship or boat, is that part of the

steering apparatus which is in immediate contact with the water. It is shaped as at A (fig. 1), hung

Fig. 1.

Fig. 2.

A, brace; B, pintle.

to the stern-post by pintle and brace hinges (fig. 2), and the upper end passing into the vessel, is acted on by the tiller. So long as the rudder, AB (fig. 3), is in a straight line with the keel, the water which glides past the vessel acts equally on both sides, producing equilibrium; but if the rudder be turned, as AB', it will be relieved from the pressure on the side DC, while that on the side DE will act with greater force, and cause the ship to revolve round the centre of gravity, G. When the head has turned sufficiently, as to D', the rudder is again put in line with the keel, see HELM.

Fig. 3.

RUDDIMAN, THOMAS, the greatest of Scottish grammarians, was born in Banffshire, at a place called Raggel, in the parish of Boyndie, October 1674. He received the rudiments of his classical education at the parish school, where he already gave promise of his future proficiency. At 16 years of age, he went to King's College, Aberdeen, where he took his degree of M.A. four years later. On leaving the university, he was engaged as tutor in a private family, in which capacity he remained a year, and thereafter became parish schoolmaster of Laurencekirk. Here he accidentally made the acquaintance of the celebrated physician and Latinist, Dr Archibald Pitcairne, who was so impressed with R.'s learning and sagacity, that he exerted his influence, and succeeded in getting him appointed assistant-keeper of the Advocates' Library, Edinburgh. His new office gave him ample opportunity for prosecuting his favourite studies, but the remuneration was so small, that, in 1707, he was compelled to commence business as an auctioneer. It was at this time that he began his career as an editor by publishing an edition of Volusenus's (Florence Wilson's) *Dialogue on the Tranquillity of the Mind*, to which he prefixed a life of the author. In 1709, he published Arthur Johnston's *Poetical Paraphrase of the Song of Solomon*, and the same author's *Cantica*—both in Latin. In 1714 appeared his well-known work—by which his name will always be honourably perpetuated among Scotchmen—*Rudiments of the Latin Tongue*, a text-book from which, under a great variety of forms, his countrymen still continue to be initiated into classical literature. In 1715, he published his great edition of Buchanan's works (2 vols. folio); and in that year, exchanged the calling of an auctioneer for the more congenial one of printer. In this capacity he was assisted by his brother, who became his partner, and had been originally bred

to the business. Some years afterwards, he was appointed printer to the university of Edinburgh. In 1725, he published the first part of his great grammatical work, his *Grammatica Latina Institutiones*, which is devoted to the Etymology of the language; and in 1732, the second part, which treats of the Syntax. His philological reputation rests mainly on this work, which has been re-edited in Germany by Stallbaum, and is repeatedly referred to in the Latin Lexicon of Freund. He also prepared an elaborate treatise on Prosody, of which, however, he published only an abridgment. His next appointment was that of principal keeper of the Advocates' Library. In this capacity he published a magnificent edition of Anderson's *Diplomata et Numismata Scotiæ* (1 vol. folio), and prefixed a learned introduction in Latin. Controversy with men such as Benson, who contrasted the Latin verse of Johnston unfavourably with that of Buchanan, and with Logan on the hereditary right of the kings of Scotland to the crown, consumed a great part of his time, but did not so pre-occupy his thoughts as to prevent him from publishing, in 1751, an edition of Livy in 4 vols. 12mo, a gem of typography, and still known as the 'immaculate' edition, from its entire exemption from errors of the press. R. died in Edinburgh, January 19, 1757, in his 83d year. In politics, he was, like his friend Pitcairne, an ardent Tory and Jacobite; and in private life, a most upright and estimable man. Besides the publications already noted, he edited the translation of Virgil's *Æneid* by Bishop Gawain Douglas, and appended a very valuable glossary (folio, 1710). He also founded the *Caledonian Mercury* newspaper, and published or edited a multitude of minor tracts and books. His life has been written by George Chalmers, the antiquary (1 vol. 8vo, 1794).

RU'DENTURE, the moulding, in form like a rope or staff, filling the flutings of columns, usually one-third of the height. It is sometimes plain, and sometimes ornamental.

RÜDESHEIM, a small town of Germany, in Nassau, on the right bank of the Rhine, opposite Bingen, and 16 miles west-south-west of Mainz. In the vicinity is grown one of the most aromatic and fiery of the Rhine-wines (q.v.) called the *Rüdesheimer*; about 650 casks are produced yearly. Pop. 2500.

RUDOLF, or **RODOLF**, of Hapsburg, the founder of the imperial dynasty of Austria, which for a time was that of Germany, was born in 1218, and was the son of Albert Count of Hapsburg and Hedwig of Kyburg-Züringen. R. early exhibited great personal daring and military skill, and acquired celebrity in his native canton of Aargau for the prowess and ability with which he repulsed the many bands of banditti who infested the district. The death, in 1264, of his uncle, Hartmann of Kyburg, to whose rich heritage he succeeded, raised him from the condition of a poor noble to the rank of an influential lord of extended territories, which included the greater part of Aargau, and various domains in the cantons of Bern, Lucerne, Zug, and Zürich. The able manner in which he governed these dominions, and exercised the functions of Protector of the Waldstätter or Forest Cantons, attracted the notice of some of the great electoral princes of Germany; and on the death of the Emperor Albert in 1273, R. was elected his successor, chiefly through the instrumentality of his powerful friend, the Archbishop of Mainz. The ratification by Pope Gregory XI. of R.'s title was obtained at the cost of various concessions, as, for instance, the renunciation of all jurisdiction in Rome, and of all feudal superiority over Spoleto and the Marches of Ancona; together with the cession of all right on the part of

the emperor and his successors to interfere in ecclesiastical elections, or in the internal administration and management of the German Church. By this agreement, the feuds were appeased which had existed for nearly 200 years between the empire and the see of Rome, and R. was able to turn his attention to the settlement of the internal disturbances of Germany. His chief enemy was Ottocar, king of Bohemia, under whom he had once served against the Prussians and Hungarians, and who now refused to do homage to him. Fortune, however, favoured R. in the war with the Bohemian king, who, after a first defeat, again rose in arms against the empire, but was ultimately defeated and killed in battle (1278), when the emperor seized all the Austrian territories which Ottocar had possessed. Wenceslaus, the son of the slain king, having lost no time in tendering homage for the kingdoms of Bohemia and Moravia, the cause of the war was at an end, and peace being restored, R. thenceforth devoted himself to the organisation of the state. His great merit was in breaking the arbitrary power of the nobles, by compelling them to demolish the fortresses and strongholds, by means of which they carried on plundering expeditions against one another, and defended themselves from the power of the law; and we are told that in one year he condemned to death 30 refractory nobles who had long disturbed the public peace, and raised to the ground double that number of strongholds. He also granted charters to many trading towns and municipalities, and thus gave considerable impetus to trade. The policy of his rule generally was indeed so greatly to favour the burgher and working classes, and to repress the tyranny of the powerful nobles, that his reign presented in this respect a favourable contrast to those of his predecessors, and the respect in which he was held by all ranks, bears the strongest testimony to his admirable qualities as a ruler. R. died in 1290, and was succeeded in Austria by his son, Albert I., Duke of Austria. See Schönknecht's *Geschichte Rudolf's von Habsburg* (2 vols. Leipz. 1843—1844).

RUDOLF or **RODOLF** II., eldest son of the Emperor Maximilian II. of Germany, was born in 1552, and educated at the Spanish court by the Jesuits. On the death of his father in 1576, he succeeded to the imperial crown, after having, during the lifetime of his father, been proclaimed king of the Romans. This first reigning namesake of the great progenitor of the Austrian dynasty did not add to the dignity or greatness of the Hapsburg family; and the whole of his reign of 36 years was marked by persecutions and intolerance on his side, and by discontent and even insurrection on that of his subjects. His bigotry and intolerance in forcing Protestants the free exercise of their religion led them to ally themselves with their co-religionists in the Low Lands and in France (1608), and by implicating the empire in foreign wars, augmenting taxation, and increasing the monetary difficulties of the state. R., who was gloomy, taciturn, and bigoted, had not the qualities necessary to secure the good-will of those around him, and he died, unregretted by his subjects, 20th January 1612, leaving no issue, and bequeathing to his brother Matthias, who succeeded him, an impoverished and distracted state. R.'s taste for astrology and the occult sciences, and his anxious desire to discover the philosopher's stone, led him to extend his patronage to Kepler and Tycho Brahe, whose study of astronomy was thought specially to qualify them for that much-coveted discovery; and his patronage which R. extended to the Danish discoverer, when the latter was obliged to leave his own country, through the jealousy of his brother-

RUDOLSTADT—RUFF.

nobles, has proved one of the few claims possessed by R. to the grateful remembrance of late times. The important astronomical calculations begun by Tycho, and continued by Kepler, which are known as *The Rudolphine Tables*, derive their name from this emperor, who originally undertook, but subsequently failed, for want of means, to defray the expenses incidental to the undertaking. See Kurz's *Geschichte Oesterreichs unter Kaiser R.* (Linz. 1821).

RUDOLSTADT, the chief town of the principality of Schwarzburg-Rudolstadt, is charmingly situated in a hill-girt valley, on the left bank of the Saale, 18 miles south of Weimar. Pop. (1872) 7084.

RUDRA is, in Vedic Mythology, a collective name of the gods of the tempest, or Maruts, Rudra (in the singular) being the name of their father. (See John Muir's *Contributions to a Knowledge of the Vedic Theogony and Mythology*, in the *Journal of the Royal Asiatic Society*, new series, vol. i. part 4, London, 1864.) In later and Puranic mythology (see HINDU RELIGION and PURANA), Rudra (the terrible) is a name of Siva, and the Rudras are his offspring. 'From Brahmā's forehead,' the *Vishnu-Purāṇa* relates, 'darkened with angry frowns, sprang Rudra, radiant as the noontide sun, fierce and of vast bulk, and of a figure which was half male, half female. "Separate yourself," Brahmā said to him, and having so spoken, disappeared: obedient to which command, Rudra became twofold, disjoining his male and female natures. This male being he again divided into eleven persons, of whom some were agreeable, some hideous, some fierce, some mild; and he multiplied his female nature manifold, of complexions black or white.' See Wilson's *Vishnu-Purāṇa*.—The word *rudra* apparently comes from the Sanscrit *rud*, weep; but as the sense of this radical does not yield any satisfactory clue to the meaning of the deity called Rudra, the *Purāṇas* invented a legend, according to which Rudra received this name from Brahmā, because, when a youth, he ran about crying aloud; and when asked by Brahmā why he wept, replied that he wanted a name. 'Rudra be thy name,' rejoined Brahmā: 'be composed; desist from tears.' In this legendary etymology there is, moreover, a punning on the similarity between *rud*, cry, and *dru*, run—an illustration of one of the sources whence the later mythology of India derived some of its boundless stock of absurd myths.

RUE (*Ruta*), a genus of plants, of the natural order *Rutaceæ*, having a short 4—5-parted calyx, 4 or 5 concave petals, affixed by a claw, 8 or 10 stamens, and a 4—5-lobed germen, with 8 or 10 nectariferous pores at the base. The species are natives of the south of Europe, the north of Africa, the Canary Isles, and the temperate parts of Asia. They are half shrubby; and have alternate, stalked, repeatedly pinnate leaves with translucent dots, the flowers small, and in terminal corymb. COMMON R., or GARDEN R. (*R. graveolens*), grows in sunny stony places in the countries near the Mediterranean. It has greenish-yellow flowers, and glaucous evergreen leaves with small oblong leaflets, the terminal leaflets obovate. It is not a native of Britain, but is frequently cultivated in gardens. It was formerly called *Herb of Grace* (see *Hamlet*, act iv. scene 5), because it was used for sprinkling the people with holy water. It was in great repute among the ancients, having been hung about the neck as an amulet against witchcraft in the time of Aristotle. It is the *Peganon* of Hippocrates. R. is still employed in medicine as a powerful stimulant, but the leaves must be used fresh, as they lose their virtues by drying. The smell of R., when fresh, is very strong, and to many very disagreeable; yet the Romans used it much for flavouring food, and

it is still so used in some parts of Europe. The leaves chopped small are also eaten with bread and butter as a stomachic, but they must be used

Common Rue (*Ruta graveolens*).

sparingly, as they are acrid enough to blister the skin if much handled, and in large doses act as a narcotic poison. All their properties depend on an acrid volatile oil, which is itself used for making *Syrup of Rue*, eight or ten drops of oil to a pint of syrup; and this, in doses of a teaspoonful or two, is found a useful medicine in flatulent colic of children. The expressed juice of R., mixed with water, and employed as a wash, promotes the growth of the hair.—Some of the species found in the north of India resemble Common R. in their properties, and are used for the same purposes.

RUFF (*Machiles pugnax*), the only known species of its genus, is a bird of the family *Scolopacidae*, and like snipes and many others of the family, an inhabitant of marshy places. It is found in most of the northern parts of the world, migrating southwards in autumn, and northwards in spring. It is

Ruff and Reeve (*Machiles pugnax*).

found in England and in Ireland, but not in Scotland, probably because there are few localities in that country suitable to it. In size, the R. is considerably larger than a snipe, and is about a foot in entire length, from the point of the bill to the tip of the tail. The tail is short and pointed. The wings are long and pointed. The legs are long and slender, the *tibia* naked for some distance above the tarsal joint. The bill is straight, rather

RUFFE—RUHNKEN.

slender, as long as the head. The neck of the male is surrounded, in the breeding season, with a ruff of numerous long feathers, whence probably the English name. The males are remarkable for diversity of colours, no two specimens being ever similar; but ash-brown prevails, spotted or mottled with black; the head, ruff, and shoulders are black, glossed with purple, and variously barred with chestnut. The female (the *Reeve*) is mostly ash-brown, with spots of dark-brown, much more uniform in colour than the male. Their nest is usually situated on a tussock in a moist, swampy place, and is formed of the coarse grass which surrounds it. The eggs are four in number. The R. is taken for the table in spring, but the young birds taken in autumn are very preferable. They are often fattened after being taken, and are fed on bread and milk with bruised hemp-seed. After being fattened, they are sent to market. They feed readily when quite newly caught, and fight desperately for their food, unless supplied in separate dishes, which is therefore the regular practice of the feeders, who find it also advantageous to keep them in darkened apartments. The R. is gradually becoming scarcer in England, owing to the destruction of its favourite haunts, the fens, by drainage.

RUFFE, or POPE (*Acerina cernua*), a very pretty little fish of the Perch family (*Percidae*), abundant in the lakes, slow rivers, and ditches of many parts of the middle of Europe and of

Ruffe or Pope (*Acerina cernua*).

England. It is not found in Scotland. It is never more than five or six inches long. In shape, it resembles the common perch, but has only a single dorsal fin. The R. is highly esteemed for the table. It is very easily caught, a small red worm being used as bait.

RUFFLE is a low vibrating sound, less loud than a roll, produced by drummers. It is used as a compliment to general officers and at military funerals.

RU'GBY, a market-town of England, in the county of Warwick, and 15 miles north-east of the town of that name, is pleasantly situated on a rising ground on the left bank of the Avon, and is reached by five different railways. It derives its importance and celebrity wholly from its grammar-school, founded by Lawrence Sheriff, a London shopkeeper, in 1567. The buildings of the school, consisting of a fine Elizabethan quadrangle, with cloisters, and an elegant detached chapel, are of brick, with stone-work round the windows and at the angles and cornices. The chapel contains among other monuments of head-masters, that of the late Dr Arnold. In 1865, the school was attended by 500 pupils. The endowment of the school produces about £5000 a year, and it offers 20 exhibitions of values varying from £40 to £80 a year, and tenable for four years. A park of eleven acres is set aside for foot-ball, cricket, and

other games. The railways and the school give rise to almost all the trade of the town. Pop. (1871) 7385.

RU'GELEY, a market-town in the county of Stafford, on the right bank of the Trent. There are iron-works in the town, and collieries in the vicinity. Pop. (1861) 4362.

RÜ'GEN, the largest of the islands of Germany, belongs to Prussia, and lies in the Baltic, off the coast of Pomerania. Greatest length, 33 miles; greatest breadth, 28 miles; area, 423 sq. miles. Pop. 45,000. It is separated from the mainland, with which at one time it was probably connected, by a strait, about a mile in width. The island is so deeply indented on all sides by the sea, that it seems to be formed of several narrow tongues of land attached to each other, and to which the name of peninsulas has been given. On the peninsula of Jasmund is the precipitous cliff called the Stubbenkammer, the highest point of which (420 feet) is called the King's Seat, because Charles XII. witnessed from this spot a sea-fight between the Swedes and Danes, August 8, 1715. From this peak, a flight of 600 steps, cut in the rock, leads to the beach below. In the vicinity is Hertha Lake, believed to be the place where, according to Tacitus, the goddess Hertha (Earth) was worshipped. The soil of the island is productive, cattle are reared, and the fisheries around the island are carried on with profit. The scenery of R., which is everywhere pleasing, and is frequently grotesque and romantic, together with the facilities for sea-bathing, attract numerous visitors. Chief town, Bergen, in the middle of the island, with (1862) 3647 inhabitants.

RUHNKEN, DAVID, born 2d January 1723 at Stolpe, in Pomerania, received his academical education first at the Königsberg gymnasium, where he distinguished himself not only in classical learning, but even in music and drawing, and afterwards at Wittenberg University, where he spent two years in the assiduous study of ancient literature, history, and jurisprudence. He graduated 1743; after which he went to Leyden, where for six years he prosecuted his classical studies under the guidance of Hemsterhuis, and bestowed particular attention on the Greek writers, nearly all of whom he read. He devised a new edition of Plato, collected the scholia of that author, and published an excellent edition of Timæus's *Lexicon Vocum Platoniarum* (Leyd. 1754; re-edited in a much improved form, 1789). He went in 1755 to Paris, where, for a whole year, he examined the MSS. of the Royal Library and of the Library of St Germain. Hemsterhuis then got him appointed as lector (reader) in the university of Leyden, in which capacity he was the assistant and colleague of his great master. In October 1757, he introduced his series of lectures by a discourse, *De Græcæ Artium et Doctrinarum Inventrice* (Leyd. 1757). For four years he discharged the duties of his office with a skill and success that raised him in public esteem as one of the most learned men in Holland. In 1761, he succeeded Oudendorp in the chair of Eloquence and History. In 1767, he lost his friend and master Hemsterhuis; and in his capacity as rector of the university, delivered a splendid tribute to the deceased in his *Elogium Tiberii Hemsterhuisii* (Leyd. 1768). In 1774, he succeeded Gronovius as librarian to the university, which he enriched with a multitude of valuable books and MSS. He died 14th May 1798, and in gratitude to his memory, the city of Leyden purchased his great library, and gave his widow an annuity of 500 florins.

R. will long be remembered as one of the best scholars and critics of the 18th century. His fine taste and sagacity, aided by an astonishing memory

and vast learning, enabled him to illustrate the authors of antiquity with wonderful success. He was also a brilliant prælector, for which he was no doubt indebted to the extreme lucidity and grace of his Latin style. A list of his works would occupy much space. In addition to those already noted, we may mention his edition of vol. ii. of Alberti's *Metaphysics*; his edition of Rutilius Lupus; of Velutius Paternulus; of Muretus, &c. He contributed to the editions of the classics by other scholars, such as Ernesti and Schweiglæuser, and thereby accumulated a vast amount of valuable material in the shape of correspondence and miscellanea. His life has been written by his famous pupil Wyttenbach (Leyd. 1799; new and improved edition, Leips. 1822, and Frieberg 1846).

RUHR, a river of Prussia, an affluent of the Rhine, rises about a mile from Winterberg, in the east of Westphalia, and flowing in a west-north-west direction, enters the plain of the Rhine at Mühlheim, and joins the great river at Ruhrort, two miles north-west of Duisburg. Entire length 143 miles.

RUHRORT, a small town of Rhenish Prussia, on the right bank of the Rhine, 63 miles north-east of Aix-la-Chapelle by railway. It has the best harbour on the Lower Rhine, possesses many large ship-building docks, is the seat of an immense coal-trade with Holland—the coal being derived from large beds of the mineral on the banks of the Ruhr—and carries on a large carrying-trade in corn, timber, and wool, and in miscellaneous articles. A large fleet of steamers, with passengers and traffic, ply from R. up to Strasburg, and down to Holland. A railway crosses the Rhine here, and passengers and goods are carried across the river in the carriages, and without being put to the trouble of shifting their seats, by means of a large steamer, the deck of which is fitted with rails. On each side of the river is a tower, 120 feet high, connected with the railway, and furnished with a powerful engine, by means of which the railway carriages are lowered to the water on one side, and lifted to the railway on the other. Pop. (1872) 7740.

'**RULE BRITANNIA**,' one of the national anthems of Great Britain, which has been described by Southey as 'the political hymn of this country as long as she maintains her political power.' Its original appearance was in a masque entitled *Alfred*, the words by James Thomson the poet, and David Mallet, and the music by Dr Arne, which was performed for the first time on August 1, 1740, before Frederick, Prince of Wales, at his residence at Cliefden. The words of the ode are believed to be the composition of Mallet. *Alfred* was altered by Mallet in 1751, when three stanzas of *Rule Britannia* were omitted, and three others, by Lord Bolingbroke, substituted for them; but it is the ode in its original form that has taken root.

RULE NISI, in the English and Irish courts of law, is a technical term denoting the first step in an interlocutory application to the court, such as an application for a new trial. The usual course is for the party who takes the initiative to move, *ex parte*,

for a rule nisi, i. e., an order of the court that something shall be done, *unless* the opposite party, within a certain time, usually three or six days, shew cause, i. e., some good reason why the thing proposed should not be done. When the party obtains a rule nisi, he sends a copy of it to the other party, who must then, at the time appointed, shew cause, and if the cause is deemed sufficient, the rule is discharged, i. e., the application is refused; if the cause is insufficient, the rule is made absolute, i. e., the opposite party is bound to do the thing asked, otherwise he will be liable to some disadvantage or sometimes to imprisonment, according to the nature of the subject matter.

RULE OF FAITH, the name given in polemical theology to what is regarded as the code from which the faith of Christians is to be drawn. One of the most vital of modern religious controversies is that which turns upon the question: What is the Christian rule of faith? We can but undertake to state the conflicting views. The Reformers, as a body, laid it down as a first principle, that the Word of God alone, by which they meant the written word, or the Scriptures, could safely be accepted as a rule of faith. If the Fathers could be received at all, it is only in the light of witnesses, and fallible witnesses, to the ancient interpretation of the Scriptures. This doctrine appears to be much modified in the English Church of the Laudian period, and by the successors of that school, the modern Tractarians, who admit the 'consent' of the Fathers as an authoritative interpretation of the Scriptures. Roman Catholics, on the contrary, while they admit that God's word alone is the rule of faith, yet contend that the Scriptures are not to be considered as the only depository of God's word. Much of our Lord's teaching to his apostles was not committed to writing in these authentic Scriptures; and as the teaching of Christ, wherever found, is God's word, even as much as what is written in the Scriptures, they hold that if it be possible to find such teaching elsewhere than in the Bible, the teaching so found is to be held as part of the rule of faith. Now they hold that the traditions of the church, contained in the writings of the Fathers, the decrees of councils, the decretals of popes, are a depository of Christ's teaching, less accessible, it is true, but when unanimous, not less certain than the Scripture itself; and of this certainty of such unanimous interpretation, they regard the church as at all times the authoritative expositor.

Protestants acknowledge the authority of the oral teaching of Christ himself, and of his apostles, or others speaking by inspiration; but in respect of the want of any authoritative or trustworthy record, they deny that any such teaching, not recorded in the Scriptures, is of any value to us. As to the right of the church to expound authoritatively, they deny it altogether.

RULE OF THE OCTAVE, a well-known formula of musical progression, which shews the method of accompanying or harmonising the ascending and descending scale.

RULE OF THREE—RUMINANTIA.

RULE OF THREE is the technical term for that rule in arithmetic, otherwise called Proportion (q. v.), which teaches the finding of a fourth number proportional to *three given numbers*. The term 'rule of three' has been in use from the commencement of the 16th c.; and from the great utility of the operation in commercial transactions, it received, almost from the commencement, the name of the **GOLDEN RULE** (q. v.). To the ordinary 'rule of three' was added the *backer rule*, or 'rule of three inverse' (corresponding to inverse or Reciprocal [q. v.] proportion), and the 'double rule of three,' in which two or more ratios are given as determining the number to be found.

RUM, a mountainous island of Argyleshire, belongs to the group of the Inner Hebrides, 15 miles north-north-west of Ardnamurchan Point. It is 8 miles long, about $7\frac{1}{2}$ miles broad; area upwards of 30,000 acres, only about 6 per cent. of which is under cultivation. Pop. (1851) 162; (1871) 81. The island is a mass of high sharp-peaked mountains, rising in Ben More to the height of 2320 feet.

RUM, a kind of spirit made by fermenting and distilling the 'sweets' that accrue in making sugar from cane-juice. The scummings from the sugar-pans give the best rum that any particular plantation can produce; scummings and molasses, the next quality; and molasses the lowest. Before fermentation water is added, till the 'sett' or wort is of the strength of about 12 per cent. of sugar; and every ten gallons yields one gallon of rum, or rather more. The flavour of rum depends mainly on soil and climate, and is not good where canes grow rankly. Pine apples and guavas are at times thrown into the still, but on the great scale, no attempt is made to influence flavour artificially. The finest-flavoured rums are produced by the old-fashioned small stills. The modern stills, which produce a strong spirit at one operation, are unfavourable to flavour. The colour of rum is imparted after distillation by adding a certain proportion (varying with the varying taste of the market) of caramel, or sugar melted without water, and thus slightly charred. Rum is greatly improved by age, and old rum is often very highly prized; at a sale in Carlisle in 1865, rum known to be 140 years old sold for three guineas per bottle. It forms a very important part of our colonial produce: the quantity imported in 1863—1864 was no less than 7,194,738 gallons, and the revenue derived from it was £1,738,399. It is distilled both in the East and West Indies.

RUMA, a small town of Austria, in the crown-land of the Temeser Banat and Servian Wojwodschafft, on an affluent of the Save, 35 miles north-west of Belgrade. The chief industry is wine-culture, and the rearing of horses. Pop. 7500.

RUMFORD, BENJAMIN THOMPSON, COUNT, an American inventor, was born at Woburn, Massachusetts, March 26, 1753. Having received the rudiments of education at a common school, he entered a merchant's office at Salem, at the age of 13, and got his living as a clerk and school teacher, while he studied medicine and physics. In 1770, he was engaged as teacher of an academy at Rumford, now Concord, the capital of New Hampshire; and in 1772, married a rich widow of that place, and was made major of militia by the English governor. The jealousy of officers over whom he had been promoted, and charges of disaffection to the royal cause, at this period of the outbreak of the American revolution, drove him from Rumford to Boston, where he became acquainted with General Howe; and when General Washington compelled the surrender of Boston, Thompson was sent to England

as bearer of dispatches. In London, he so won the favour of the government by his intelligence, as to be appointed Under-secretary of State in the Colonial Office. On a change of ministry, however, he returned to America, and fought in the royal cause. When it failed, he entered the service of the king of Bavaria, by whom he was knighted; and in 1784, he was settled at Munich as aide-de-camp and chamberlain to the reigning sovereign. In this post he exhibited the energy of his mind and the fertility of his invention. He reorganised the army and improved its tactics. In 1790, he suppressed beggary throughout the kingdom, took measures for improving the breeds of horses and cattle, and laid out a park for Munich. He rapidly rose to the offices of major-general, councillor of state, lieutenant-general, minister of war, and was created Count of the Holy Roman Empire, when he chose Rumford, where his fortunes had begun, as his titular designation. In 1795, he visited London, where he was treated with much attention, and finding that his opinion was sought after on technological subjects, he published the results of his experience and the records of his labours in Bavaria. Having long and carefully studied the phenomena of heat, he set himself to devise a remedy for the smoky chimneys, which were one of the greatest nuisances at that time in England; and discovered the principles upon which fireplaces and chimneys have since been constructed. Other cases in which greater economy of the application or production of heat could be obtained, as cooking-ranges, stoves, &c., engaged much of his attention. On his return to Bavaria, he was appointed President of the Council of Regency, and soon after, Minister Plenipotentiary to the Court of St James; but the British government, holding to the doctrine of inalienable allegiance, refused to recognise him in that capacity. He declined an invitation to visit America, where he was greatly admired, in spite of his loyalty. He finally settled in Paris; devoted himself to improvements in artillery and illumination; founded a professorship, in Harvard College, of the Application of Science to the Arts of Livaria; married the widow of Lavoisier; and died at Auteuil, near Paris, August 21, 1814, after making many important bequests to the Royal Society in London, the American Academy of Sciences, and Harvard University.

RU'MILL. See **TURKEY**.

RUMINANTIA, in the zoological system of Cuvier, and of almost all recent naturalists, the name given to an order of Mammalia called *Proboscidea* by Linnaeus, an extremely well defined natural order, among the individuals of which the habit of *rumination* or chewing the cud is universal and almost peculiar. The *R.* are all strictly and exclusively herbivorous, and exhibit a great similarity of structure. They have no incisors in the upper jaw, the front of which is occupied by a callosous pad. 'The grass is collected and rolled together by means of the long and movable tongue; it is firmly held between the lower cutting teeth and the pad of the cartilaginous upper lip assisting in this; and then by a sudden nodding motion of the head, the roll of herbage is either torn or cut off, or partly both torn and cut.'—Youatt. In the lower jaw there generally appear to be eight incisors; but the two outer are more properly to be regarded as canines, and in the *Camelidae*, they assume the ordinary canine form. Some of the *R.* have canines in the upper jaw, and some are destitute of them. In front of the molar teeth, there is a large vacant space in both jaws. The molars are situated on each side in each jaw; their surface exhibits

crescent-shaped ridges of enamel. The head is elongated, the neck is always of considerable length, the eyes are placed at the side of the head, and the senses of smell and hearing, as well as of sight, are extremely acute. The head is in many R. armed with horns, which in some are found in both sexes, in some only in the male, whilst in others they are wholly wanting; and the absence of them characterises varieties of some species, as the sheep and ox, in which they are ordinarily present. The horns differ very much in different families, even in their structure, some being hollow (true *horns*), some solid (*antlers*). All the four limbs are terminated by two large toes, which are hoofed. Behind the hoof are always two small spurs, rudimentary toes. The metacarpal and the metatarsal bones are united into one, called the *cannon bone*. The legs are rather long, and the spinal column is very flexible. The brain of the R. is small, and they do not exhibit much intelligence; nor are they distinguished by any remarkable instincts; and though easily tamed, they are scarcely susceptible of any kind of training or education. Very few, however, of the numerous species of R. have been truly domesticated, and probably much is yet to be done in this way.

The R. are generally gregarious; they are distributed over almost the whole world; but none are natives of Australia. They are found both in the warmest and the coldest regions. The flesh of all the R. is fit to be used for human food; the fat (tallow) hardens more on cooling than the fat of other animals, and even becomes brittle. The fat, hide, horns, hoofs, hair, bones, entrails, blood, and almost all parts are useful to man.

The intestines are long in all the Ruminantia. The caecum is also long. The complex stomach, adapted to rumination, requires a more particular description. The stomach consists of four distinct bags or cavities. The first of these, into which the gullet or oesophagus enters, is, in the mature animal, by far the largest, and is called the *Paunch* (Lat. *rumen*). Into this the chief part of the food passes. It is lined with a thick membrane, presenting numerous prominent hard papillae, secreting a fluid in which the food is soaked. The second cavity is the *Honeycomb Bag* (Lat. *reticulum*), so called from its being internally covered with a net-work of cells, like those of a honeycomb. In Scotland, it is known as the *King's Hood*. This second cavity, or stomach, has also a direct communication with the oesophagus, and fluids seem in general to pass immediately into it, but sometimes or partly also into the other cavities; and it is here that the cells for retaining water are chiefly found in the camel. The third cavity, or stomach, is the *Manyplies* (Lat. *psalterium*), so called because its lining membrane forms many deep folds, like the leaves of a book, beset with small hard tubercles. This also communicates directly with the oesophagus, by a sort of prolongation of it. The leaves of the membrane seem to serve for the absorption of superfluous fluid from the food. Finally, the food passes into the fourth cavity, which is of a more elongated form than any of the others, and is next in size to the first. This is called the *Reed* or *Rennet* (Lat. *abomasus*). It may be considered as the true stomach, homologous—if any one of the four parts can be so regarded—to the simple stomach of mammals in general. It is lined with a velvety mucous membrane in longitudinal folds. It is here that the gastric juice is secreted. In young animals, it is the largest of the four cavities, and it is only when they pass from milk to crude vegetable food that the paunch becomes enlarged, and all the parts of the complex stomach come fully into use. It seems to be by

a power of what may be called instinctive volition, that the animal directs what passes through the gullet into the first cavity, the second, or even the third. It has been found by M. Flourens, who made many experiments on this subject, that the food consumed by ruminants passed chiefly into the first cavity, but part of it also at once into the second, and even, when it was given in a *mashed* or in a much comminuted state, into the third.

The particular means by which hastily swallowed food is brought from the paunch, formed into pellets at the base of the oesophagus, and brought up into the mouth for rumination, or second and more thorough mastication, are not yet very thoroughly understood, notwithstanding the patient investigations of M. Flourens. He ascribes the formation of the pellets, however, to the action of the muscular duct which connects the oesophagus with the second and third stomachs, and the power which the animal has of closing or opening at will the orifices of these cavities.

Chewing of the cud is very generally performed in an attitude of repose, and evidently affords great pleasure to the animal.

The R. are arranged by naturalists in seven families, all very natural—*Camelidae* (see CAMEL), *Moschidae* (see MUSK), *Cervidae* (see DEER), *Cameloparidae* (see GIRAFFE), *Antelopidae* (see ANTELOPE), *Bovidae* (q. v.), and *Capridae* (q. v.). The most important genera and species are separately noticed.

RUMP PARLIAMENT. In order to bring about the condemnation of Charles I., Oliver Cromwell, on 8th December 1648, sent two regiments, under the command of Colonel Pride, to coerce the House of Commons. Forty-one members of the Long Parliament who were favourable to accommodation were imprisoned in a lower room of the house, 160 were ordered to go home, and only 60 of the most violent of the Independents were admitted. The clearance was called *Pride's Purge*, and the privileged members ever afterwards passed by the name of the *Rump*, forming, as it were, the rag-end of the Long Parliament. This assembly, in conjunction with the army, brought about the arraignment, trial, and condemnation of Charles I. Five years later, the Rump Parliament, forgetting that it was but the creature of the army, attempted to make a stand against certain demands on the part of the soldiers. The result was that Cromwell filled the House with armed men; the Speaker was pulled out of the chair, the mace taken from the table, the room cleared, the door locked, and the parliament declared to be dissolved. Supreme in the three kingdoms, Cromwell convoked an assembly which assumed the title of Parliament, and acquired from the name of one of its most prominent members, a leather-seller, called Praisegod Barebones, the name of the *Barebones Parliament*. The Barebones Parliament, after subsisting five months, was dissolved, and Cromwell, raised to the dignity of Protector, convoked two parliaments, and dissolved them for refusing to sanction his measures. On Oliver Cromwell's death, and Richard's succession to the Protectorate, the military malcontents coalescing with the Independents in Richard's parliament, declared the expulsion of the Rump illegal, and restored that assembly to its functions. With the revival of the Rump, its quarrel with the army revived; and the troops, again surrounding Westminster Hall, expelled it on 13th October 1659, a provisional government of officers assuming the direction of affairs. But the general dissatisfaction having led to a coalition between the Presbyterians and Royalists, the army, unable to carry on the government, was reduced to the necessity of once more restoring the Rump, which had been twice ignominiously

RUM SHRUB—RUNES.

expelled. The advance of Monk, however, with the army of Scotland led to a general cry throughout the country for a free parliament. A number of the members who had been excluded by Pride's Purge reappearing in the House, placed the Independents in the minority; and on 16th March 1660, the despised and derided Rump at last solemnly decreed its own dissolution. The most prominent members of the Rump Parliament were Vane and Hazlerig.

RUM SHRUB, a liqueur in which the alcoholic base is rum, and the other materials are sugar, lime or lemon juice, and the rind of these fruits added to give flavour. Almost every maker has his own receipt, and much credit is assumed by each for his own especial mixture.

RUNCORN, a thriving market and manufacturing town and river-port of Cheshire, on the left bank of the Mersey, 12 miles south-east of Liverpool. There is a station of the North-western Railway on the Lancashire side of the river, and the town is the terminus for the Bridgewater and the Mersey and Irwell Canals. It is a free port, has a custom-house, and contains iron-foundries, soap and chemical works, ship-building yards, &c.; and in the vicinity are collieries, and slate and freestone quarries. Large quantities of freestone are shipped for distant ports. In 1864, 4566 vessels, of 278,000 tons, entered and cleared the port. Pop. (1851) 8049; (1861) 10,434; (1871) 12,443.

RUNES, the earliest alphabet in use among the Teutonic and Gothic nations of Northern Europe. The exact period of their origin is not known. The name is derived from the Teutonic *rán*, a mystery, whence *runa*, a whisper, and *helrún*, divination; and the original use of these characters seems to have been for purposes of secrecy and divination. The resemblance which some of the runic characters bear to the Phœnician alphabet and others derived from it, has led to the supposition that they were first introduced by Phœnician merchants who traded with the coasts of the Baltic; and while the mass of the people were allowed to possess but a very partial acquaintance with them, the priests systematised them, and retained a full knowledge of them in their own hands, no doubt finding them useful in establishing a reputation for superior power and intelligence. Scandinavian and Anglo-Saxon tradition agree in ascribing the invention of runic writing to Ódin or Wodin. The countries in which traces of the use of runes exist include Denmark, Norway, Sweden, Iceland, Germany, Britain, France, and Spain; and they are found engraved on rocks, crosses, monumental stones, coins, medals, rings, brooches, and the hilts and blades of swords. Runic letters were also often cut on smooth sticks called *rán-stäfas*, or mysterious staves, and used for purposes of divination. But there is no reason to believe that they were at any time in the familiar use in which we find the characters of a written language in modern times, nor have we any traces of their being used in books or on parchment. We have an explanation of the runic alphabet in various MSS. of the early middle ages, prior to the time when runes had altogether ceased to be understood.

The systems of runes in use among the different branches of the Teutonic stock were not identical, though they have a strong general family likeness, shewing their community of origin. The letters are arranged in an order altogether distinct from that of any other alphabetical system, and have a purely Teutonic nomenclature. Each letter is, as in the Hebrew-Phœnician, derived from the name of some well-known familiar object, with whose initial letter

it corresponds. Runes being associated in the popular belief with augury and divination, were, to a considerable extent, discouraged by the early Christian priests and missionaries, whose efforts were directed to the supplanting of them by Greek and Roman characters. But it was not easy suddenly to put a stop to their use, and we find runic continuing to be employed in early Christian inscriptions. This was to a remarkable extent the case in the Anglo-Saxon kingdoms of Northumbria, Mercia, and East Anglia, where we have traces of runic writing of dates varying from the middle of the 7th to the middle of the 10th century. Its continued prevalence in this particular district has been accounted for by the fact that, after the death of Edwin and the flight of St Paulinus, the restoration of Christianity in Northumbria was effected by missionaries of the Irish school, whose predecessors had adopted the policy, not, like Augustine and his brethren, of destroying the monuments of pagan antiquity, but of allowing them to remain and consecrating them by marking them with the symbols of Christianity. Runes are said to have been laid aside in Sweden by the year 1001, and in Spain they were officially condemned by the Council of Toledo in 1115.

The different systems of runes, all according to a certain point, have been classed as the Anglo-Saxon, the German, and the Norse, each containing different subordinate varieties. The Norse alphabet is generally considered the oldest, and the parent of the rest. It has 16 letters corresponding to our *f, u, th, o, r, k, h, n, i, a, s, t, b, l, m, g*; but has no equivalent for various sounds which exist in the language, in consequence of which the sound of *k* was used for *g*, *d* for *t*, *b* for *p*, and *u* and *y* for *o*; *o* was expressed by *au*, and *e* by *ai*, *i*, or *ia*; and the same letter otherwise was made to serve for more than one sound. Other expedients came, in the course of time, to be employed to obviate the deficiency of the system, as the addition of *d* and the adoption of new characters. But the system received a fuller development among the Germans and Anglo-Saxons, particularly the latter, whose alphabet was extended to no fewer than forty characters, in which seem to have been embraced more nearly than in any modern alphabets, the actual sounds of a language. Till recently, the Norse runes had been most studied; but of late the Anglo-Saxon have become the subject of considerable attention. The following table exhibits the best known forms of the Anglo-Saxon, German, and Norse runic alphabets, with the names and the power of the several letters:

The Anglo-Saxon runes, as here given, are derived from a variety of MS. authorities, the most complete containing forty characters, while some only extend as far as the twenty-fifth or twenty-eighth letter. Neither the name nor the power of some of the later letters is thoroughly known, and they are without any equivalents in the Norse runic system. The German runes are given from a MS. in the conventual library of St Gall in Switzerland. Though the various runic alphabets are not alike copious, the same order of succession among the letters is preserved, excepting that, in the Norse alphabet, *laugr* precedes *madr*, although we have placed them otherwise, with the view of exhibiting the correspondence of the three systems. The number of characters in the Anglo-Saxon alphabet is a multiple of the sacred number eight; and we have the evidence both of a Swedish bracteate containing twenty-four characters, and of the above-mentioned St Gall MS., that there was a recognised division of the alphabet into classes of eight letters—a classification which forms the basis of a system of secret runes noticed in that MS. Of these secret runes, there are several varieties specified: in particular 1. *Iis-runa* and *Lago-runa* (of which specimens exist in Scandinavia), consisting of groups of repetitions of the character *iis* or *lago*, some shorter

and some longer, the number of shorter characters in each group denoting the class to which the letter intended to be indicated belonged; the number of longer ones, its position in the class. 2. *Haal-runa*, where the letters are indicated by characters with branching stems, the branches to the left denoting the class, and those to the right the position in that class. There is an inscription in secret runes of this description at Hackness in Yorkshire. 3. *Stof-runa*, in which the class is indicated by points placed above, and the position in the class by points below, or the reverse.

The best known inscriptions in the Anglo-Saxon character are those on two gravestones at Hartlepool in Northumberland, on a cross at Bewcastle in Cumberland, and on another cross at Ruthwell in Dumfriesshire. The inscription on the west side of Bewcastle cross, which we give as a specimen of Anglo-Saxon runes, is a memorial of Alcfrid, son of Oswiu, who was associated with his father in the government of the kingdom of Northumbria, in the 7th century.

Runes.

It has been thus deciphered into the Anglo-Saxon dialect of the period:

+ THIS SIGBECUN
 SETTÆ HWÆTRED
 EM GÆRFÆ BOLDU
 ÆFTÆR BARE
 YMB CYNING ALCFRIDÆ
 GICEGÆD HEOSUM SAWLUM.

Or in modern English:

This memorial
 Hwætred set
 and carved this monument
 after the prince
 after the king Alcfrid,
 pray for their souls.

The inscription on the Ruthwell cross, after being long a puzzle to antiquaries, was first deciphered in 1838 by Mr John M. Kemble, an eminent Anglo-Saxon scholar. It is written alternately down one side of the stone and up another, and contains a portion of a poem on the subject of the Crucifixion. Mr Kemble's interpretation received a very satisfactory confirmation by the discovery of a more complete copy of the same poem in a MS. volume of Anglo-Saxon homilies at Vercelli.

Mr D. H. Haigh, whose researches have added much to our knowledge of Anglo-Saxon runes, has endeavoured to set up for them a claim of priority

defeat, the consequences of which had a most disastrous effect upon the fortunes of the Royalist party. His conduct at Naseby, and his hasty surrender of the city of Bristol, irritated the king, who forthwith deprived him of his command, and requested him to leave England without delay. In 1648, however, he was recalled and appointed to the command of the royal fleet. In this new vocation he acquitted himself with much daring and somewhat more caution, and for three years he kept his ships afloat, after escaping the blockade in which he had been held for a twelvemonth off the Irish coast by the great parliamentarian Admiral Blake; but in 1651, the latter attacked the prince's squadron, and burned or sunk most of his ships. With the few vessels still remaining to him, R. escaped to the West Indies, where, in concert with his brother Maurice, he led a bucaneeering life, maintaining himself and his men by seizing upon English and other merchantmen. After a few years spent in this manner, R. managed to elude the vigilance of Cromwell's captains, and made good his way to France, where he remained till the restoration of his cousin, Charles II. R. served with distinction under the Duke of York, and in concert with the Earl of Albemarle, against the Dutch, and died in 1682 in the enjoyment of various offices and dignities, being a privy councillor, a member of the Admiralty, governor of Windsor Castle, &c. The last ten years of his life were spent in retirement in the pursuit of chemical, mechanical, and physical researches, for which he evinced considerable aptitude. Although it is certain that he did not discover the art of engraving in mezzotinto—the real inventor of which appears to have been a German, Von Tregen, whose early works bear the date of 1642—R. no doubt improved the mechanical mode of the art, which he described and illustrated for the Royal Society of London in 1662, after he had completed several interesting engravings on the new principle. The glass bead known as Prince Rupert's Drop (q. v.) derives its name from the prince.

RUPERT'S LAND, so called from Prince Rupert (q. v.), who was one of the founders of the Hudson's Bay Company, was formerly the official designation of that extensive tract which forms the basin of Hudson's Bay and Strait, and is bounded on the west, south, and north by the water-sheds of the Arctic, St Lawrence, and Atlantic rivers. The western boundary is from Deer Lake to a point a little to the west of the Red River Settlement (q. v.). In 1870, the territory held by the Hudson's Bay Company was admitted into the Dominion of Canada, a portion of R. L. falling within the province of Manitoba. The whole of the vast territory known as R. L. slopes inwards towards Hudson's Bay, and is well supplied with navigable rivers. The mountains of this region, which are chiefly on the boundaries, are of primitive rock, and a great portion of the country is densely wooded. The soil is rich, but on account of the severity of the climate—which is not only of a generally low temperature, but exceedingly variable in summer and autumn—the cereals and other alimentary plants are not cultivated to any extent; in fact, they are only planted in the neighbourhood of the trading posts of the Hudson's Bay Company (q. v.) and in the agricultural settlement on Red River, in the south-west. In the north, the vegetation and climate are those of the polar regions. The chief dependence of the inhabitants of R. L. for food and clothing is on the animal kingdom, which is here most abundantly represented. Beavers are still found, and bears, otters, martens, and muskrats are abundant, their skins forming the chief

commercial product of the country. There are also abundance of foxes of various colours, bears, wolverines, Canadian lynxes, &c. Among the animals used for food are the wapiti, reindeer, moose, and other species of deer; the musk-ox, hares, and an immense variety of wood-fowl and other birds. The numerous rivers and lakes are abundantly stocked with fish. The population, which is scanty, is composed of British or Canadians, and aboriginal tribes.

RUPIA is a somewhat severe form of skin-disease. It is characterised by flatish, distinct *bulle* or blebs containing a serous, purulent, or sanious fluid, which becomes changed into thick scabs. Several varieties of this disease have been established by dermatologists. In its simplest form, the blebs are not preceded by any inflammatory symptoms, are about an inch in diameter, and contain a fluid which is originally thin and transparent, but soon thickens, becomes purulent, and dries into brown ragged scabs, which are elevated in the centre. The scabs are easily separated, and leave ulcerated surfaces on which several successive scabs usually form before healing ensues. In a more severe form, known as *Rupia prominens*, the scab projects so much in the centre as to resemble a limpet-shell in form.

Rupia is a chronic disease, and is usually limited to the limbs, the loins, and the nates. It is not contagious, and generally attacks persons debilitated by old age, intemperance, bad living, or previous diseases, especially small-pox, scarlatina, and syphilis. The general treatment consists mainly in the administration of tonics, such as quinine, mineral acids, ale, wine, animal food, &c. Some writers strongly recommend the tincture of argemone; and there is no doubt that certain cases which will not yield to tonics, rapidly improve when treated with iodide of potassium. The local treatment consists in puncturing the blebs as soon as they arise, in removing the scabs by poulticing, and in applying a slightly stimulating application, such as a solution of nitrate of silver—to the adjacent ulcers. The disease is frequently tedious and obstinate, but the patient almost always ultimately recovers.

RUPPIN, *NEU*, a town of Prussia, in the province of Brandenburg, on a small lake of the same name, which communicates by water with the Elbe, 38 miles north of Potsdam. It contains a Catholic lunatic asylum, and 10,000 inhabitants, who are engaged in brewing, spinning, and the manufacture of linen and woollen cloths.

RUPTURE. See **HEENTIA**.

RURAL DEAN, an official, ordinarily a beneficed clergyman, appointed in a diocese to maintain in a certain district, called a deanery, a supervision over the condition of churches, church furniture, glebe houses, schools, the appliances for public worship, and all other things appertaining to the service, and to report on all to the bishop; an occasion may arise.

RURIK, who is considered to have been the founder of the Russian monarchy, was, according to most authors, a 'Varangian' of Scandinavian origin, who was invited by the Slaves of Novgorod to come and rule over them; according to others, he was the chief of a tribe of Norse colonists who was located near the Gulf of Finland, and, after a long contest, succeeded in subduing the northern Slaves and some neighbouring tribes of Finns; when Kostomarov attempts to prove that he was a Lettish anian. That he was either a Scandinavian or of Scandinavian origin, there seems to be very little doubt, and it is as generally maintained that he accompanied by his brothers, Sindri (Sineus) and

Truvor, he, at the head of a small army, took possession of the country to the south of the Gulf of Finland, Lakes Ladoga, Onega, and Beloe in 861 or 862, and laid the foundation of a monarchy. His brothers afterwards settled, the one at Bielo-ozero, and the other at Izborsk; but dying without issue, their principalities were united to Novgorod by Rurik. Novgorod was made the seat of government in 864 or 865, and the various insurrections of his Slav subjects were quenched in blood, Vadim, their leader, whose valour is celebrated by the ancient chroniclers, perishing by R.'s own hand. To secure himself and his descendants in their newly-acquired territory, R. invited various colonies of Varangians to settle in the country, and after reigning peaceably from this time, he died in 879. During his reign, some of the Varangians attempted a land expedition against Constantinople, but renouncing the scheme, settled on the banks of the Dnieper, and founded the little state of Kiev. The family of R. reigned in Russia till the death, in 1598, of Feodor, son of Ivan the Terrible, when, after a brief intestine contest, it was succeeded by the nearly allied House of Romanoff (q. v.). Many noble families of Russia, such as Odojefski, Obolenski, Dolgorouki, Lfot, Belosselaki-Belosserski, and Gagarin, are legitimately descended in the male line from R.; and the princes of Romodanofski-Ladyzhenski are legitimate descendants in the female line.

RUSA, a genus of *Cervida*, or subgenus of *Cervus* (see DEER), containing a number of species of deer, natives of the forests of the East Indies, which may be described as stags with round antlers, a snag projecting in front just above the base of each, and the top forked, but the antlers not otherwise branched. They are generally of large size, and among them are some of the finest kinds of Asiatic deer. The GREAT R. (*R. Hippelaphus*) is supposed by some to be the *Hippelaphus* of Aristotle; but his description is not complete enough to identify the species. It is a native of Java, Sumatra, &c., and is about the size of a large stag, with brown rough hair, the neck with a long mane.—The SAMBUR or SAMBOO (*R. Aristotelis*) of India is a

Sambur (*Rusa Aristotelis*).

similarly large and powerful animal, and no Indian deer is more sought after by European sportsmen. It also is supposed by some to be the *Hippelaphus* of Aristotle. The colour is sooty brown, and the male has a mane. It is solitary in its habits, and delights in low forests where water abounds.—The Axis (q. v.) is very nearly allied to this genus.

RU'SCUS. See BUTCHERS' BROOM.

RUSH (*Juncus*), a genus of plants of the natural order *Juncaceae*, having a glume-like (not coloured)

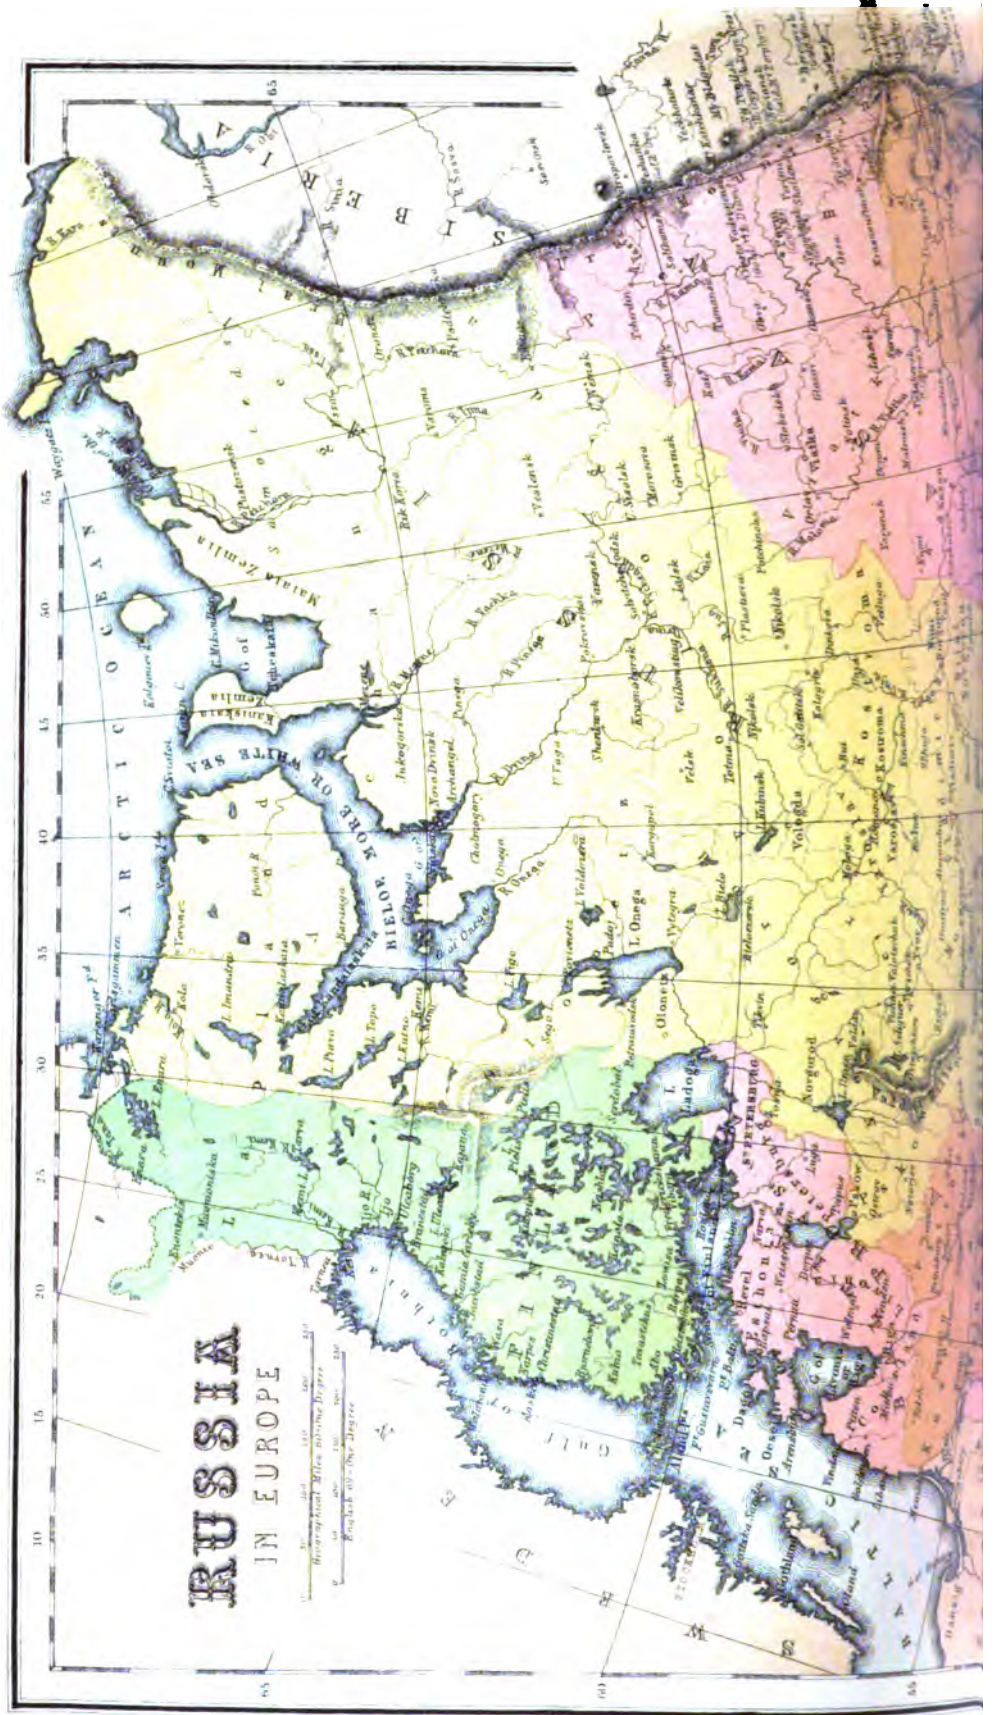

perianth, smooth filaments, and a many-seeded, generally 3-celled capsula. The species are numerous, mostly natives of wet or marshy places in the colder parts of the world; some are found in tropical regions. Some are absolutely destitute of leaves, but have barren scapes (flower-stems) resembling leaves; some have leafy stems, the leaves rounded or somewhat compressed, and usually jointed internally; some have plane or grooved leaves on the stems; some have very narrow leaves, all from the root. The name R. perhaps properly belongs to those species which have no proper leaves; the round stems of which, bearing or not bearing small lateral heads of flowers, and popularly known as *Rushes*, are used for plaiting into mats, chair-bottoms, toy-baskets, &c.—The Soft R. (*J. effusus*) is a native of Japan as well as of Britain, and is cultivated in Japan for making mats. In ruder times, when carpets were little known, rushes were much used for covering the floors of rooms; to which many allusions will be found in early English writers. The stems of the true rushes contain a large *pith* or soft central substance, which is sometimes used for wicks of candles. There are 20 or 22 British species of R., some of which are very rare, some found only on the highest mountains, but some are among the most common of plants. They are often very troublesome weeds to the farmer. Thorough drainage is the best means of getting quit of them. Lime, dry ashes, road scrapings, &c., are also useful. Tufts of rushes in pasture are a sure sign of insufficient drainage. Many marshy and boggy places abound in some of the species having leafy stems and the leaves jointed internally, popularly called *Sprots* or *Sprits*, as *J. acutiflorus*, *J. lamprocarpus*, and *J. obtusiflorus*. They afford very little nourishment to cattle; but are useful for making coarse ropes for ricks, &c., which are stronger than those made of hay.

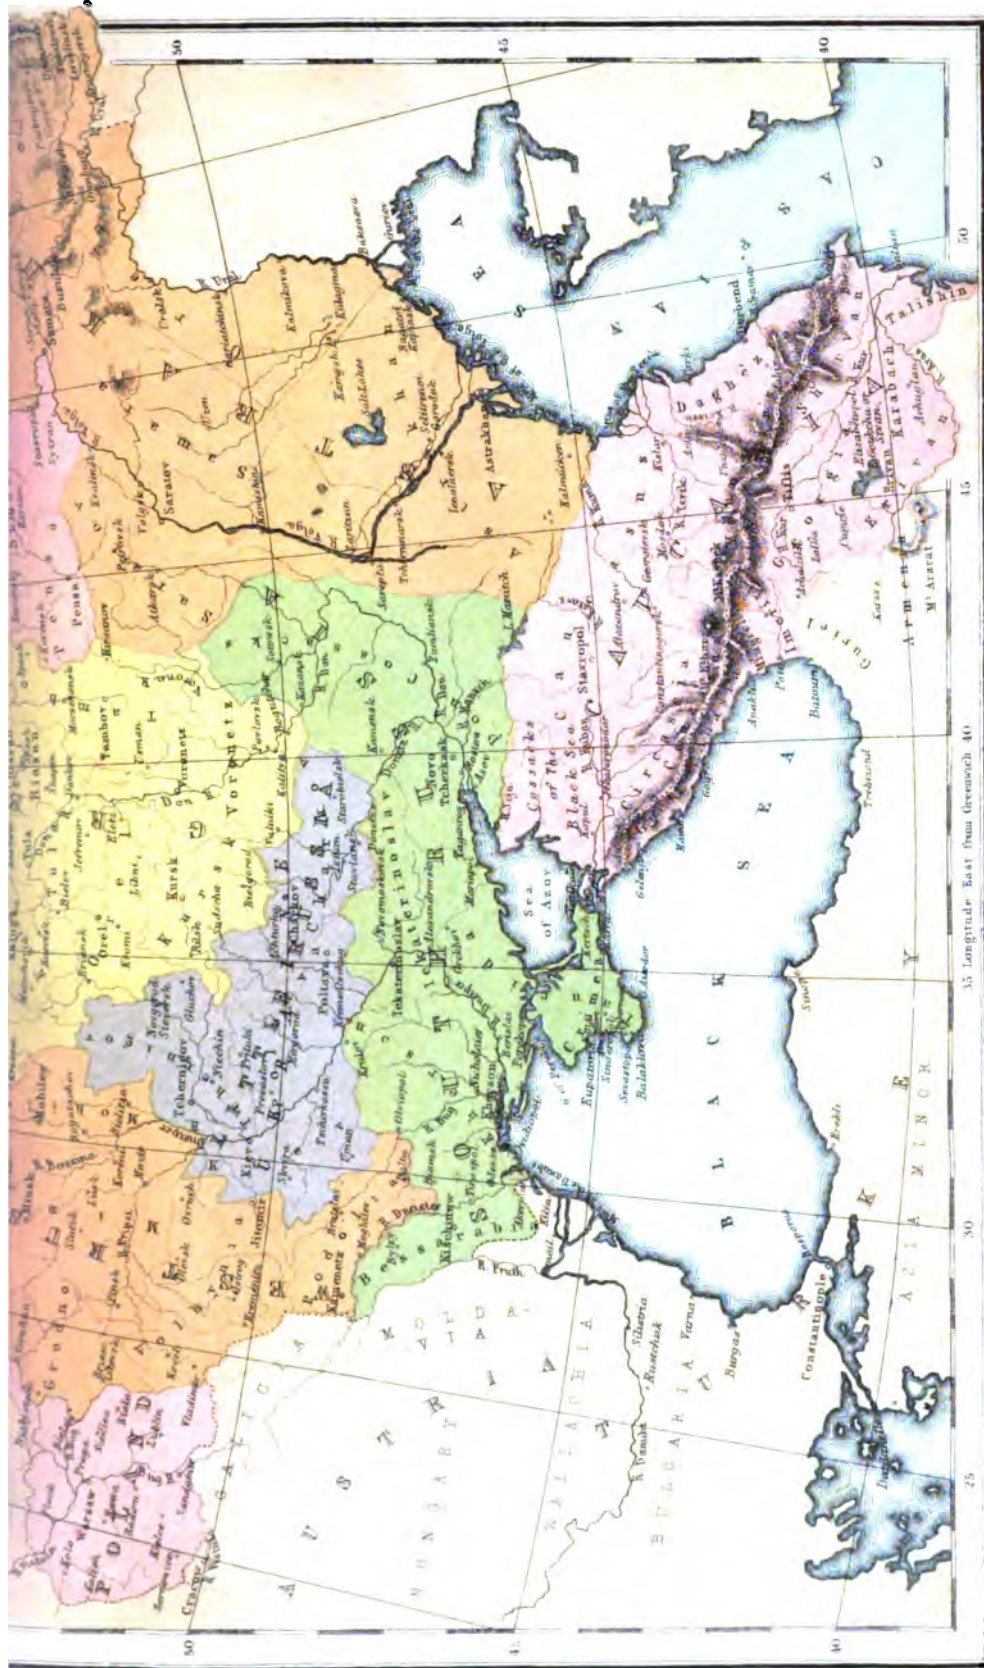

RUSH, BENJAMIN, M.D., an American physician, was born near Philadelphia, December 24, 1745, was educated at Princeton College, studied medicine in Philadelphia, London, Edinburgh, and Paris, and in 1769 was made Professor of Chemistry in the Philadelphia Medical College, and became a contributor to medical literature. Elected a member of the Continental Congress, he advocated and signed the Declaration of Independence. In 1777, he was appointed Surgeon-general and Physician-general of the continental army. His duties did not prevent him from writing a series of letters on the constitution of Pennsylvania, which was changed by his influence. He resigned his post in the army, because he could not prevent frauds upon soldiers in the hospital stores. In 1785, he planned the Philadelphia Dispensary, the first in the United States; and was a member of the convention which ratified the Federal constitution. Retiring from politics, he became Professor of the Theory and Practice of Medicine in the Philadelphia Medical College; and was so successful in the treatment of yellow fever in 1793, that he was believed to have saved the lives of 6000 persons. His practice, in consequence, became so large that he prescribed for 100 patients a day, whom he saw even at his meals. Virulently attacked by Cobbett, who published a newspaper in Philadelphia, he prosecuted him for a libel, and recovered 5000 dollars damages. His medical works produced honours from several European sovereigns. The chief of them were *Medical Inquiries and Observations, Diseases of the Mind, Medical Tracts, Health, Temperance, and Exercise*. In 1779, he was appointed Treasurer of the United States Mint, which post he held until his death in Philadelphia, April 19, 1813.

Utrecht. In more recent years he has given to the world from the family archives, the *Correspondence of John, fourth Duke of Bedford*, which throws much light on the secret history of the early part of George III.'s reign; the *Life, Diary, and Letters of Thomas Moore*, in pursuance of a promise made to the poet several years before; the *Correspondence of Charles James Fox*, and *Life and Times* of that great Whig statesman. Having now noticed his career as an author, we may briefly pass in review his long, honourable, and consistent career as a politician. In 1813, he was elected for the family borough of Tavistock, and vigorously but vainly opposed the repeal of the Habeas Corpus Act in 1817. He made his first motion in favour of parliamentary reform in 1819, and continued to bring the subject almost annually before the Lower House, until he stood forward as a minister of the crown to propose the great measure of 1831. He was also the strenuous advocate of the repeal of the Test and Corporation Acts, Roman Catholic Emancipation, and other measures of civil and religious liberty. In 1828, he carried by a large majority his motion for the repeal of the Test and Corporation Acts, although it was opposed by the Duke of Wellington's government. In 1829, he supported the Catholic Emancipation Bill. At the general election of 1830, caused by the death of George IV., the rallying cry of Parliamentary Reform sent many additional Liberals into the House of Commons. The 'Great Duke' was driven from office; and Earl Grey being appointed prime minister, proceeded to form a cabinet pledged to peace, retrenchment, and reform. R. did not receive a seat in the cabinet, but he was appointed to the lucrative office of Paymaster of the Forces, and was one of the four members of the government to whom Earl Grey intrusted the task of framing the draft of the first Reform Bill. The great and imperishable honour next devolved upon R. of proposing the bill (March 1, 1831). The fortunes of the measure belong to the history of the time; suffice it to say, that on the 4th of June 1832, the bill obtained the royal assent, and that the country was saved from the throes of revolution and civil war, which at one period appeared imminent. R. left office with the Melbourne government (which had succeeded to that of Earl Grey) in November 1834. In March 1835, he brought forward a motion in favour of taking into consideration the temporalities of the Irish Church. It was opposed by the government, but after three nights' debate, was carried by 322 votes against 289. On the 4th April, he carried a resolution in committee in favour of appropriating any surplus which might remain, after fully providing for the spiritual wants of the members of the Irish Church, to the general education of all classes of Christians. The report of the committee having been affirmed by the whole House, the government of Sir Robert Peel was dissolved, and that of Lord Melbourne restored. R. now became Home Secretary, with a seat in the cabinet. On the 5th of June 1835, he brought in an important bill for the reform of the municipalities of England and Wales, which was carried after some mutilation, and secured an effective reform of municipal institutions. Next session, he proposed and carried the government plan for the commutation of tithes in England. Also a bill for a general registration of marriages, births, and deaths, the value of which, in social and statistical inquiries, can scarcely be overrated; and a bill for the amendment of the marriage laws, which enabled dissenters to be married in their own chapels. He likewise passed an English Church Reform

Bill, making a new distribution of episcopal dioceses and incomes. In 1837, he carried a series of bills for further amending the criminal law, by which capital punishment was finally removed from forgery and all offences except seven. An Irish Tithe Bill was also passed, but the 'appropriation clause' being always rejected by the Lords, R. was obliged to accept the bill divested of the clause. He exchanged the seals of the Home for those of the Colonial Office, when the Canadians broke into rebellion in 1839, and sent over Lord Durham, who recognised the right of the Canadians to self-government; and who, with his successor, Lord Sydenham, brought the Canadians into loyal and harmonious relations with the mother-country, which have never since been disturbed.

In 1841, R. proposed a fixed duty of 8s. per quart on foreign corn, and a reduction of the duties on sugar and timber. Being defeated by the opposition, the Melbourne government appealed to the country without success; and R. and his colleagues made way for the administration of Peel. In a general election, he challenged the verdict of the city of London upon the free-trade measures of the government, by boldly leaving Stroud, and standing for the city. He was elected by the narrow majority of nine votes, and continued to represent the city until his elevation to the peerage. In November 1845, R. wrote a letter from Edinburgh to the electors of the city of London, announcing his conversion to the total and immediate repeal of the corn laws. This letter led to the resignation of the Peel cabinet; and R. was commissioned by the Queen (December 11, 1845) to form an administration, which at first he failed to do through the antipathy of Earl Grey to Lord Palmerston, and Sir Robert Peel being recalled to power, had the honour of carrying the repeal of the corn laws. His Irish Coercion Bill, however, being defeated by the combined Whigs and Protectionists, he resigned; and R. became nominally what he had been really during the greater part of the Melbourne administration—prime minister. In 1846, a series of assassinations in Ireland compelled him to propose a more stringent coercion act than that of the previous session. In 1847, he had to deal with the Irish famine; and in 1848, with a miniature Irish rebellion. The paper bull, parcelling England into dioceses, extorted from R. an indignant protest, first in the form of a letter to the Bishop of Durham, and next in the Ecclesiastical Titles Bill of 1851, prohibiting the assumption of territorial titles by Roman Catholic prelates. R.'s advice to the Queen to dismiss her Foreign Secretary and his ancient colleague, Lord Palmerston, for communicating, without consultation with his colleagues, his approval of the French *état d'état*, precipitated the downfall of the R. administration, and in February 1852 he ceased to be First Lord of the Treasury. Lord Derby made an unsuccessful attempt to carry on the government; and in the succeeding cabinet of the Earl of Aberdeen, R. consented, December 1852, to fill the post of Foreign Secretary with the leadership of the House of Commons. In the session of 1854, he brought forward a new Reform Bill, but was most reluctantly compelled to resign it in consequence of the Crimean War. He was next appointed Commissioner to the Congress of Vienna, and incurred so much unpopularity by recommending terms of peace, and a plan of counterpoise suggested by Austria, that he was forced by the pressure of unfavourable opinion to leave the ministry (July 1855). He voted against the government on Mr Cobden's motion against Lord Palmerston's Chinese policy, which led to a dissolution. When the second administration of Lord Palmerston

W & R CHAMBERS LONDON & EDINBURGH

RUSSELL—RUSSIA.

was formed (June 1859), R. became for the second time Foreign Secretary, which office he held until 1865. He threw the moral influence of his name and the nation he represented into the scale of Italian unity and independence. He uttered warnings and remonstrances against the annexation of Savoy and Nice by France, which gave great offence to the government of the Emperor Napoleon by their frankness and candour. He ably preserved British neutrality in the civil war between the Federal and Confederate States of America. He wrote spirited dispatches expressive of the indignation with which the British government regarded the despotic acts of Russia in Poland; but he incurred many reproaches from the Poles and their sympathisers in France and England, for withdrawing from the Austrian and French alliance when war with Russia appeared imminent. More recently, he took an active but not a successful part in the Sleswig-Holstein dispute, which the peculiar policy of the French emperor brought to nothing. R. has always taken a prominent part in promoting the education of the people, and, with the assistance of Lord Lansdowne, laid the foundation of the present system of national education, supported by parliamentary grants, and administered by the Committee of Privy Council for Education. He brought forward for many years a measure admitting the Jews to parliament, which passed in 1858 upon a compromise suggested by the Earl of Lucan. But the question with which he has ever been identified in the public mind is parliamentary reform. He brought in a Reform Bill in 1852, a second in 1854; moved the resolution which procured the condemnation of the Derby Reform Bill in 1859; and in 1860, brought in another government bill, which failed to pass. In 1861, he was called to the Upper House, and exchanged the courtesy title of 'Lord John,' by which he had been so long known, for that of Earl Russell. On the death of Lord Palmerston in 1865, Earl R. became prime minister for the second time. In 1866 he and Mr Gladstone introduced a Reform Bill, which was rejected, and the ministry shortly thereafter resigned. Since then, Earl R. has been an active but unofficial member of the Liberal party in the House of Lords. Though his voice is weak and his delivery affected, Earl R. is an admirable and successful debater. His language is plain and terse; and his speeches sometimes rise to a high order of oratory. His indomitable self-reliance and tenacity of self-assertion were sarcastically painted by the Rev. Sydney Smith, who called him the 'Lycurgus of the Lower House,' and said that he was 'utterly ignorant of all moral fear.' Since the works mentioned above, Earl R. has published a new edition of his *Essay on the Constitution*, selections from his speeches and despatches, and various addresses; and, in 1873, the veteran statesman entered fearlessly on a new field, and gave us his *Essays on the Rise and Progress of the Christian Religion*.

RUSSIA, EMPIRE OF, extending over a large proportion of the northern regions of the globe, includes the eastern part of Europe, the whole of Northern Asia, and a part of Central Asia. Lat. 38° 30'—78° N.; long. 17° 19' E.—190° E. (170° W.). The portion of North America which formerly belonged to R. was ceded to the United States in 1867. R. is bounded on the N. by the Arctic Ocean; on the E. by the Pacific Ocean; on the S. by the Chinese empire, Turkestan, Caspian Sea, Persia, Asiatic and European Turkey, and the Black Sea; and on the W. by Austria, Prussia, the Baltic, and Sweden. The area of R. amounts to very nearly 8,000,000 square miles, and is more than double the entire area of Europe. The empire thus covers nearly

1/4th of the surface of the globe, and more than 1/4th of the land superficies of the planet. The population of this vast area was in 1867 estimated to amount to upwards of 82,000,000. The following table gives the areas and populations of the 50 governments of European Russia, and of the other Russian dominions:

Name of Government.	Area in Eng. square miles.	Population in 1867.
1. Archangel,	236,595	275,779
2. Astrakhan,	81,969	573,954
3. Bessarabia,	14,006	1,052,018
4. Courland,	10,550	597,288
5. Don Army, Province of the,	61,900	1,010,135
6. Ekaterinoslav,	26,128	1,281,482
7. Esthonia,	7,607	322,608
8. Grodno,	14,952	958,852
9. Jaroslavl,	13,751	999,383
10. Kaluga,	11,870	984,255
11. Kazan,	23,714	1,670,337

* Incorporated with Russia in 1863.

† In 1871.

The Russian Sea-board.—The northern shores of the Russian territories, which are washed by the Arctic Ocean, are deeply indented. The White Sea (q. v.), an immense arm of the Arctic Ocean, penetrates 350 miles into the mainland, and is subdivided into the gulfs of Onega and Archangel or Dwina. The other chief inlets on the north of R. are the Kara Sea and the gulfs of Obi and Yenisei. Westward from Nova Zemla (usually, but less correctly, spelled Zembla), the Arctic Ocean is navigable for three months of the year; east from that island, the sea, even at the mildest season, is encumbered with floating icebergs. The chief islands in this ocean are the Kolguef, Waigat, Nova Zemla, and Spitzbergen Isles. The eastern shores of R. are washed by the Pacific, subdivided

into the Behring, Okhotsk, and Japan Seas; and the islands belonging to this country in these seas are Sakhalin, and the northern part of the Kuriles. On the south are the Black Sea (q. v.) and the Sea of Azov (q. v.), the latter communicating with the former by the Strait of Kertch, and so shallow that it is navigable for small craft only. Of the Caspian Sea, R. commands the whole, with the exception of the south shore, which belongs to Persia. The northern and eastern banks of the Caspian are the seats of the chief fisheries of the empire. On the north-west of R. are the Baltic Sea, with the gulfs of Riga, Finland, and Bothnia; and in these waters, the islands of Aland, Esel, and Dago belong to the empire. The freezing of the water near the shores of the Baltic renders the navigation of this sea impracticable during five months of the year, although a few ports are accessible throughout the whole year. Possessing means of easy communication with the most fertile governments of the interior, and sustaining chiefly the commerce of the Russian empire with the other parts of Europe and with America, the Baltic is of the highest commercial importance.

Surface, Hydrography, and Soil.—European Russia consists of a vast plain bordered with mountains. On the east are the Ural Mountains (q. v.), forming a broad range of no great elevation, ending on the north on the shores of the Arctic Ocean, and on the south in a range of elevated plains on the left bank of the Volga. On the south-east of the great plain is the lofty range of the Caucasus (q. v.), crossed by the Pass of Derbend and the so-called Military Georgian Road. The Crimean Mountains, a continuation of the Caucasian chain, rise to 5000 feet in their highest summit. The districts in the south-west of R., between the Vistula and the Pruth, are covered by hilly ranges from the Carpathian Mountains (q. v.), which in Poland are known as the Sandomir Mountains. The Finland Mountains, on the north-west, are ranges of granite rocks, embracing numerous lakes, and not rising higher than 600 feet. The Alaunsky table-land, which connects itself with the Ural Mountains by a chain of hills in latitude about 62° N., is the key to the configuration of European Russia. From this table-land, with an elevation of about 1200 feet, the country, with gradually declining slopes, falls away in four directions—north to the Arctic, north-west to the Baltic, south to the Black, and south-east to the Caspian Sea. The sloping country on the north of the Alaunsky heights is called, from its eastern and western limits, the Ural-Baltic table-land; that on the south of the same dividing heights is called, for the same reason, the Ural-Carpathian table-land. The Alaunsky heights form the great water-shed, and regulate the course of all the great rivers of the Russian empire. To the north, they throw off the Petchora, the Northern Dwina, and the Onega; to the south, the Dniester, Bug, Dnieper, Don, and Kouban; to the south-east, the Volga, with its great affluents the Oka and Kama. The Western Dwina, the Niemen, and the Vistula, fall into the Baltic Sea. The important rivers of R. receive separate notice under their own names. At the foot of the north-west slope from the central terrace, is the lake-country of European Russia, and the great lakes (which are noticed separately) are Ladoga, Onega, Ilmen, Peipus, and Pskov. The plain of European Russia naturally divides itself into three tracts or zones, each of which differs from the others in the nature and quality of its soil. The northern zone extends between the Arctic Ocean and the Ural-Baltic table-land, the middle zone between the Ural-Baltic and the Ural-Carpathian table-lands, and the

southern zone between the Ural-Carpathian table-land and the Black and Caspian Seas. The soil of the northern zone is marshy, and the climate inclement. In its middle part, between the rivers Onega and Mezen, and especially along the banks of the Northern Dwina, forests of fir-wood and large tracts of fodder-grass occur. Toward the east of this tract, the woods disappear, and vast marshy, frozen the greater part of the year, cover the country. The middle zone reaches south-west to the government of Volhynia and the south of Poland, and north-east to the Ural Mountains. In the west, it consists of an extensive hollow, covered with woods and with marshes, the chief of which are those of Pinsk (q. v.). In the middle part of this zone, the soil is partly heavy and covered with mould, and toward the north, sandy. Beyond the Oka, luxuriant meadows abound; and on the east, beyond the Volga, this tract forms an extensive valley, covered with a thick layer of mould, abounding in woods, and rising into hills in the vicinity of the Ural range. The southern zone consists of steppes extending along the shores of the Black and Caspian Seas. The steppes of the Black Sea have mostly a mouldy soil, covered with grass; but in the south-east, shifting sands and salt marshes predominate. The steppes of the Caspian consist of sand, salt marshes, and salt lakes—the Elton lake, yielding nearly 4,000,000 puds (about 1,290,000 hundredweights) of salt annually, being the most remarkable.

Constitution and Administration.—The government is an unlimited monarchy, the head of which is the emperor, who unites in himself every authority and power—that is to say, is the head of the military, the legislative, and the judicial system, and is also the ecclesiastical chief of the orthodox Greek Church. The order of succession is by primogeniture, hereditary in heirs-male, and in default of males. Every military or civil officer of the crown is required to take an oath of allegiance. The expenses of the imperial palace amount to about £1,200,000 annually; the crown appanages, constituting the private property of the imperial family, yield an annual revenue of £700,000. The council of state is the highest branch of the executive, and comprehends the legislative, judicial, and administrative powers. The president and members—among whom are always included the ministers of the crown—are appointed by the emperor. A secretary of state, whose duty it is to report the opinions of the council to the emperor, is attached to this body. The estimates of expenditure and income, and every proposition introducing an addition to, or a modification of, the laws, is considered and revised by this council, which, for the more orderly discharge of its functions, is divided into three sections: 1. Law; 2. Civil and Ecclesiastical; 3. Executive and Finance. The main function of the council is that of superintending the general administration, of watching over the execution of the laws of the realm, and of proposing alterations of the same when necessary. The second of the great branches of government is the senate, whose functions are partly deliberative and partly executive. It is the Imperial Court of Justice for the empire, controlling all the inferior tribunals; and besides its legal duties, examines into the state of the public revenue and expenditure. The senate is divided into several committees or departments, of which five sit at Petersburg and two at Moscow. The third of the great branches of government is the Holy Synod, superintending the religious affairs of the empire. Its decisions have no force till approved by the emperor. The fourth and highest board of government is the Committee of Ministers, the highest administrative body. It is divided into

nine departments, which have under their management the Court; Foreign Affairs; War; the Navy; the Interior; Public Instruction; Finances; Crown Domains; Public Works; and has besides a general board of control. All of these great boards centre in the private cabinet of the empire. Except the departments of Foreign Affairs and the Imperial Court, all these branches of the central administration are represented in the provinces. European Russia is divided into 50 provinces, over each of which is a governor, appointed by the emperor, and who is the head of the civil administration of the province or government. Some provinces, although administered by governors, are united under the superintendence of a governor-general. This arrangement is rendered necessary owing to the immense extent of the empire, and the governor-generalships are generally remote frontier regions. Of late years (especially since 1862), reforms have been effected throughout all the various branches of the government. Reforms in the municipal and rural administration of the provinces, which give increase of self-government, have been for some time in operation. Several important legal reforms—indeed, an entirely new legal system, incorporating oral testimony and trial by jury, with the present system of Russian jurisprudence, and opening the business of the courts to the public eye—were laid before the public in a published form in 1864, and have since been carried out. By the Russian law, capital punishments are only inflicted for high-treason or *lesse-majesté*. Corporal punishment by the Knout (q. v.) was abolished in 1863. The severest punishments inflicted for violations of the law are labour in the galleys, in the public works, deportation to the mines of Siberia, &c. There are prisons in every town throughout the empire, but the prison-system is still primitive, rude, and ill-administered.

Distinctive Rank of Classes.—The nobility occupy the highest place in the social scale, enjoy many special privileges, such as freedom from poll-tax, and form in every province a separate body, headed by a marshal, chosen by and from themselves. Till 1871 they were also free from the conscription. Functionaries, officials, artists, and clergy possess almost as many privileges as the nobility. In 1868, a most important measure was passed, by which the clerical character was declared to be no longer hereditary, and the sons of the secular clergy, hitherto bound to some ecclesiastic or monastic service, were set free to choose their own career. The next class is that of the merchants. The burghers and peasants constitute the lowest class, and are subject to claims of service and to personal taxation. Each class enjoys, to a certain extent, the right of self-administration in its own affairs. Each apportions its taxes, and chooses some of its own functionaries. The recent emancipation gave freedom to 20,000,000 peasants or serfs, who, prior to the year 1861, being governed exclusively by their owners, enjoyed very limited civil rights. Communal government is the fundamental principle of all the rights of the peasant class. In general, the lands allotted to the peasants are not their individual property, but belong to the commune, and are shared among all its members.

National Debt.—The national debt must be regarded as divided into two parts, one of which represents the loans made abroad, and the other the loans made at home. There are 13 foreign loans, the first of which was contracted in 1822, and the last in 1873, having a nominal value of £130,010,000. The interest due on home and foreign loans was estimated at £11,833,092 in 1872. There is besides paper-money, issued by government, in circulation to the value of £13,748,802.

Revenue and Expenditure.—The following table shews the amount and the details of the revenue and expenditure for the year 1872:

REVENUE.	
1. Direct Taxes (including Poll-tax),	£14,887,697
2. Indirect Taxes (including those derived from Spirits, Salt, Tobacco, Beet-sugar, Customs, and Stamps),	34,118,422
3. State Monopolies (drawn from Mines, Money, Post-office, Telegraphs),	2,987,611
4. State Domains,	5,458,083
5. Miscellaneous Receipts,	6,327,174
6. Revenue of the Trans-Caucasus,	750,782
7. 'Receites d'Ordre,'	2,690,842
8. Extraordinary Receipts,	948,674
Total,	£68,139,285

EXPENDITURE.	
1. Public Debt,	£11,833,092
2. Superior Institutions of the State,	244,942
3. Holy Synod,	1,288,483
4. Ministry of the Imperial Household,	1,226,531
5. " Foreign Affairs,	343,226
6. " War,	21,452,618
7. " Marine,	2,945,105
8. " Finances,	10,623,946
9. " Imperial Domains,	1,313,404
10. " Interior,	5,821,457
11. " Public Instruction,	1,541,868
12. " Public Works,	3,072,153
13. " Justice,	1,449,850
14. Audit of the Empire,	274,063
15. General Direction of Studs,	94,880
16. Expense of Poland for administration of Justice,	111,222
17. Civil Government of the Trans-Caucasus,	769,955
18. 'Non Valeurs,'	136,986
19. 'Dépenses d'Ordre,'	2,664,150
20. Extraordinary Expenses,	948,674
Total,	£68,056,509

Army.—The institution of a standing army took place in R. towards the close of the 17th c. under Peter the Great. Before that time, military levies were raised for longer or shorter periods, to suit the exigences of the moment; although a small permanent force was in existence from very early times. The strength of the army was, until 1871, chiefly maintained by conscription under imperial ukase, and the conscripts were taken from the class of peasants or burghers who are liable to the poll-tax. In January of that year a system of military reorganisation was instituted. There is an annual conscription to which all men who have completed their 21st year, and are not physically incapacitated, are liable. Substitution is prohibited. The period of service in the army is fifteen years, six in active service, and nine in the army of reserve. During the latter period, the soldier is liable to service only in time of war. To enable the educated classes to free themselves from compulsory conscription, young men, sufficiently educated, may enter on a short period of service from their 17th year. On the 1st January 1863, the standing army, including the guard, consisted of 31,110 generals, staff, and commissioned officers, and 818,105 privates and non-commissioned officers. This force is divided into 608 battalions of infantry, 313 squadrons of cavalry, and 182 batteries of artillery. Besides this establishment, there were 300,000 irregular troops, consisting of Cossacks, Kirghiz, Circassians, and other contingents, who are liable to military service in lieu of paying taxes. By the law of 1871, it is enacted that now, as formerly, military service will be performed under special laws by the Cossacks, the non-Russian inhabitants of certain portions of the empire, and the inhabitants of the Grand Duchy of Finland. Of these, the Cossacks are, in case of necessity, bound all to render military service. Ordinarily, the Cossacks constitute 54 regiments of irregular cavalry. The

RUSSIA.

Russian army, on the peace footing, consisted, in 1873, of 15,344 officers, and 370,913 men, distributed into upwards of 164 regiments of infantry, 52 of cavalry, 50 brigades of artillery, 5 battalions of engineers. (For further details see *ARMIES, MODERN*.) The expenditure for the army, as set down in the estimates for 1872, was £21,452,618.

Navy.—The Russian boundaries were first advanced to the sea under Peter the Great, and from the genius of that monarch the Russian navy sprang. Besides the naval depôts on the Baltic, the Black, and the Caspian Seas, there are also naval establishments on the shores of the North Pacific and on the Amur. In 1873, Russia had 160 war-vessels in the Baltic Sea, 32 in the Black Sea, and 72 distributed over the Caspian Sea, the Sea of Aral, and the Siberian waters. In all, there were 261 ships with an aggregate burden of 223,000 tons, 25 being iron-clads. The expenditure for the navy was, in 1872, £2,845,105.

Religion and Churches.—Toleration of all religions which do not violate public morality or good order, exists in R., and not to profess the orthodox Greek faith, the national religion, does not disqualify for the enjoyment of any civil rights. The law does not allow those who already belong to the established faith to secede from it; and if, in a household, either of the parents be a member of the Greek Church, all the children must be brought up within that communion. The emperor is head of the church, the affairs of which he directs by means of a synod composed of the chief prelates, who are summoned from their dioceses to attend its meetings (see *RUSSIAN CHURCH*). The direction and regulation of all other religious communities emanates from a department in the offices of the Minister of the Interior. In 1871, there were in European R., exclusive of Finland and Poland, 53,139,247 orthodox Greeks; 922,079 Raskolniks; 37,136 Gregorian Armenians; 2,882,991 Roman Catholics; 2,234,112 Protestants; 1,829,100 Jews; 2,358,766 Mohammedans; and 255,503 heathens. In 1861, there were 614 orthodox convents, 137 of which were occupied by women. There were 5648 monks, and 4879 lay-brothers; 2931 nuns, and 7669 lay-sisters; 50,394 priests and deacons, and 63,421 other persons, who were employed in religious services in the 50,165 orthodox churches. For the education of the clergy, there are 4 academies, 50 seminaries, and 201 schools, in which 54,000 persons are trained. The churches, convents, and the ecclesiastical departments in general, are maintained by government.

Public Instruction.—The department of public instruction in R. is presided over by a ministry, although many of the schools are directed by other departments. The greater number of these establishments are supported out of the imperial treasury. The empire, excepting Finland, is divided into eight educational districts, each of which has a university—namely, St Petersburg, Moscow, Dorpat, Kiev, Kharkov, Kazan, Wilna, Odessa, and Warsaw. Of the students—who do not reside within the universities—the poorest are allowed stipends for their maintenance, and the candidates for admission as students must have passed satisfactory examinations in the courses of instruction gone through at the gymnasias. Degrees are conferred in law, medicine, philology, mathematics, natural history, and the oriental languages. Degrees in theology are granted at Dorpat to students of the Lutheran faith. The professors are appointed and paid by the government. Four institutions, the law school and lyceums of St Petersburg, Nijni, and Jaroslavl, are specially devoted to legal science. The gymnasias, schools of the second class, about 100 in number, are

found in the provincial towns. Besides the universities and gymnasia, there are numerous district schools; but the means of instruction, though rapidly increasing, are very insufficient. In 1853, there were only 3000 village schools; in 1863, the number had increased to 34,075. There are also numerous special schools for instruction in mining, in wood-craft, civil engineering, navigation, &c. The military schools form a separate system. The cadets are transferred from the military gymnasia to the 'military schools,' in which they qualify to fill the posts of commissioned officers. Three academies, for the staff, the engineers, and the artillery, are devoted to the higher branches of military science. Theological education for the orthodox church is superintended by the clergy. Official tables for 1863 state that the number of schools in R. was 56,999, attended by 1,325,810 pupils, male and female.

Literary and Scientific Institutions, Museums, Press, &c.—Many of the most important institutions in R., as the Academy of Sciences and the Pulkovo Observatory, flourish in or near St Petersburg (q. v.). There are, however, throughout the empire numerous institutions and societies for the promotion of the arts and sciences. The Imperial Library at St Petersburg, with upwards of a million volumes, is one of the finest in the world. The press of R. not yet much developed, is subject to special censorship, which, though rigorously exercised under the reign of Nicholas I., is now, under the milder government of Alexander II., considerably less strict. Each year gives evident proof of the rapidly increasing taste for literature and mental culture in Russia. In 1863, there were published within R. and in the Russian tongue, 1652 volumes; in the next year the number had increased to 1831. In 1865, there were 324 periodicals, about a half of which issued from the metropolitan press.

Charitable Institutions are for the most part supported by government; and although their number is increasing annually, the scarcity of large national institutions—especially public hospitals—is painfully felt. Medical assistance can only be obtained in the provinces with the greatest difficulty, owing to the distances of the towns and the sparseness of the population. The founding hospitals of St Petersburg and Moscow receive annually about 15,000 abandoned infants and orphans.

Public Roads and Canals.—The want of good roads and ready means of communication are particularly felt in R., where the distances are great, and the population so scanty. To keep the roads in repair, is a work of the greatest difficulty here, for two reasons—the first, a difficulty in concentrating a sufficient amount of labour where the labourers are so few, and so widely dispersed; and the other, the melting of the snows and overflowing of the rivers in spring. During four or five months of the year, the soil is thickly covered with snow, which, when it becomes hardened by the frost, offers an excellent, an easy, and a universal means of transit. On the return of mild weather, however, the snow melting, sinks into and softens the earth, which is also overflowed by the rivers. The roads being thus flooded, are rendered almost wholly impassable for traffic till the soil dries. In autumn, the usual rains fall, and the earth is again soaked, so that the time for easy communication during the summer is very short. In the reign of Nicholas, only 2800 miles of railway had been constructed; but in January 1872, the mileage of railways in operation had risen to 9112, while upwards of 1430 miles were in construction. Several of the chief cities of the empire are connected by means of macadamised causeways.

RUSSIA.

which are now generally kept in good repair. The other towns are connected by ordinary track-roads, which are generally impracticable in spring and autumn. Owing to the generally bad character of the surface, and to the abundance of the rivers which traverse it, the water-communications of this empire are very important as commercial highways, though the vast transit-trade of the country is not confined to them alone. The transport of merchandise across the broad expanse of the empire, is much facilitated by canals, which have here become an important and a peculiar institution. The four seas surrounding European Russia are connected by canals: 1. The Caspian is connected with the White Sea by the canal of the Prince of Wirtemberg, between the river Schekma, an affluent of the Volga, and the upper waters of the Northern Dwina. 2. The Caspian and Baltic are connected by three systems of canals. See *VOLGA*. 3. The Black Sea is connected with the Baltic by three lines of canals—those of Beresina, Oginsky and Dnieper, and Bug, between the affluents of the Dnieper and those of the Western Dwina, Niemen and Vistula.

Postal Service.—This service was inaugurated in 1664. In 1863, there were forwarded 21,837,793 private letters, and 21,791,520 official documents. The income was about 7,960,000 roubles; the outlay, 4,240,000 roubles. In 1872, the number of offices was 2129. The number of postage stamps sold in the same year was 27,448,063.

Electric Telegraph.—Notwithstanding the immense extent of the surface of R., and the distance from each other of its principal towns, these are now nearly all united by lines of electric telegraph. In November 1872, upwards of 36,100 miles of telegraphs had been laid by the Russian government. In the end of November 1871, the telegraph line through Siberia, connecting St Petersburg with China and Japan, was finished, and a telegram forwarded from Nagasaki to the Russian capital. In 1869, there were sent 1,888,849 telegraphic messages to places within R., 391,743 to places abroad, and 120,818 official despatches.

Population.—The population of the empire is spread with great irregularity over the surface. In European Russia, its average is less than 35 per Eng. sq. m.; in the Caucasus, more than 28; in Siberia, $\frac{1}{2}$; in Poland, 112; and in Finland, 14 per Eng. sq. mile. These figures, however, cannot be taken as a correct illustration of the actual distribution of the masses over the enormous surface of the country; for, upon comparison, the degree of the density of the population of European Russia is found to vary greatly in the different governments. The government of Moscow contains 166 inhabitants per Eng. sq. m.; while that of Archangel contains only $\frac{1}{4}$. The central and south-west governments of this part of the empire are the most densely peopled. The town residents are 9 $\frac{1}{2}$ per cent. of the whole population of European Russia; 7 $\frac{1}{2}$ per cent. of that of the Caucasus; and 5 per cent. of that of Siberia. Russian society is divided into five classes, and of these the nobility forms 1.49 per cent.; the clergy (including their families) 1.01 per cent.; the bourgeois (tiers état), 8.60; the peasants, 62.56; and the military, 6.35 per cent. Irrespective of Asiatic and American Russia, we find that in Europe this empire comprises a greater variety of races than any other European state. It is not, however, like Austria, a composite community, speaking various idioms, and having different physical characteristics and political interests. In European Russia, the predominant race is the Slavonian, and the Russian 'element' and language prevail almost universally. The 50,500,000 Russians who inhabit

Europe are dividable into—1. Great Russians (33,935,000), inhabiting Central Russia. 2. Little Russians (12,015,000), located in the south-west. To the latter may be added the Cossacks (1,600,000), who are spread along the rivers Don, Kouban, Terek, Ural, Tobol, the Lake of Baikal, and the Amur. 3. White Russians (2,950,000), in the western provinces. The other Slavonic races are Poles (4,640,000), in the kingdom of Poland, and partly in the west provinces (where they form only 10 $\frac{1}{2}$ ths per cent. of the population); Servians and Bulgarians in Bessarabia and New Russia. The Finnish race (3,800,000), which occupies, under different names, the north and north-east of European Russia, and the north-west of Siberia, has in great part adopted Russian language and manners. The Lithuanians and Letts (2,460,000) dwell mostly between the Niemen and Dwina. The Turkish Tartarian race (5,700,000), in the south-east, and partly in Siberia, comprises Tchuvashes, Tartars of Kazan, Kirghiz, &c. The Mongols (376,000), comprising Kalmucks and other races in the south-east of European Russia, and in the east of Siberia. Besides these races, there are Roumains and Walachs (770,000), in Bessarabia and New Russia; Persians, Kurds, Armenians, &c. (480,000), near the Caspian Sea; Germans (920,000), distributed over the whole empire, but found in the greatest numbers in the Baltic provinces; Swedes (200,000), in Finland; Greeks (52,000), in the south; Bohemians—i.e., Gipsies (50,000)—chiefly in Bessarabia; Jews (2,014,000), mostly in Poland and the west provinces; Caucasians (1,830,000), Samoids in the north of R., and many other tribes in East Siberia and Russian America.

Climate.—Owing to its vast extent, the Russian empire presents great varieties of climate. At Archangel, the mean temperature of the year is 32° F.; at Yalta, in the Crimea, 52°; and at Kutais, in the Caucasus, 58°. Consisting of an immense area of dry land, the climate of the empire is essentially continental; and the climate of localities in its interior is much more rigorous than that of places on the western shores of Europe in the same latitudes. The mean temperature of Edinburgh and Christiania is higher than that of Moscow and Kazan. The rigour of the climate of the empire increases not only with the latitude, but as you advance eastward; thus, the mean winter temperature of the town of Abo, on the Gulf of Bothnia, is the same as that of Astrakhan—viz., 23° F.; although the former is in lat. 61°, and the other in lat. 47°, or 14° nearer the equator. The difference of the mean summer temperature under the same latitudes is, on the contrary, not very considerable. The isothermal line of Astrakhan (60° F.) passes through Lublin in Poland and Ekaterinoslav. In the east, the maximum heat is even greater than in the west; and such heat-loving plants as the water-melon are grown more successfully in the south-east of R. than in the west of Europe, under the same latitude. The dryness of the atmosphere increases in the direction from north-west to south-east. On the banks of the Baltic, the average number of rainy and snowy days is 150, and the annual rainfall is 20 inches, while near the Caspian the number of such days is 70, and the rainfall only 4 inches. The climate of R. is in general healthy; but there are several places where diseases seem to be localised, as the shores of the Frozen Ocean, where scurvy is common, the marshes along the Niemen and Vistula, where the Plica Polonica (q. v.) is the chief disease, and the marshy lands on the Black, Azof, and Caspian seas, where ague always prevails.

Manufactures.—Manufacturing industry in R. may be said to date from the reign of Peter the

Sineous (Sindf), and Truvor, accepted the invitation, and at the head of a band of armed followers (*droujina*) took possession of the territory of Novgorod. Oleg (879—912), who exercised authority as regent to Igor, Rurik's son, took Kiev, and made it the capital of the embryo empire, subduing the neighbouring tribes, and even successfully attacking the Byzantines. Igor (912—945) did nothing of note, but his widow and successor, Olga (945—957), was a wise and able ruler. She was baptised in 955 by the patriarch of Constantinople, and abdicated soon after in favour of her son *Sviatopolk* (957—972), a warlike monarch and a pagan, who was treacherously murdered by a neighbouring tribe with whom he was at war. On his death, the principality was divided among his three sons, and the quarrels usual in such cases followed, and continued till *Vladimir* (980—1015), the youngest son, became sole ruler. The Normans now definitively became amalgamated with the Slavonic race. Vladimir's reign is the 'heroic' epoch of Russian history; and the glories of the court, and the valiant feats of the warriors of the 'sunny Prince Vladimir,' have been handed down through ages in legend and song. His successful wars extended the boundaries of R. to Lake Ilmen on the north, to the mouths of the Oka and of the Khoper (an affluent of the Don) on the east, to the falls of the Dnieper on the south, and to the sources of the Vistula on the west. He became a convert to the Greek faith, and in 988 was baptised with his followers; his example being shortly followed by the whole nation, for whose spiritual guidance and supervision a metropolitan was established at Kiev. He followed the evil example of his father in dividing his dominions, and after his death a civil war broke out among his four sons, in which *Jaroslav*, prince of Novgorod, was ultimately (1036) successful. This prince did much to civilise his subjects by building towns, founding schools, and especially by ordering the compilation of the first Russian code of laws (the '*Rousskaia Pravda*'), the most prominent item of which was the limitation of the right of family feud, a limitation which was changed into total abolition after his death in 1054, by his sons, who shared the principality among them. Each of these petty princes in turn divided his portion of territory among his sons, till the once great and united realm became an agglomeration of petty states quarrelling with each other, undergoing absorption by a more powerful neighbour, or being redivided. This state of anarchy, confusion, and petty warfare dates from the death of Jaroslav in 1054, and continued, more or less, till 1478. The principal among the subdivisions of R. during this period were, according to Russian authorities, *Soussdal*, which occupied the upper and central parts of the basin of the Volga, and from which, in the beginning of the 13th century, sprang the principalities of *Tver*, *Rostof*, and *Vladimir*; *Tchernigof* and *Seversk*, which occupied the drainage-area of the Desna (an affluent of the Dnieper), stretching to near the sources of the Oka; *Riazan* and *Murom*, along the Oka basin and the sources of the Don; *Polotsk*, including the basins of the Western Dwina and Beresina; *Smolensk*, occupying the upper parts of the basins of the Western Dwina and Dnieper; *Volhynia* and *Galicia*, the first drained by the Pripet, the second lying on the north-east slope of the Carpathian Mountains, which were united in 1198; *Novgorod*, by far the largest of all, which occupied the immense tract bounded by the Gulf of Finland, the Lake Peipus, the upper parts of the Volga, the White Sea, and the Northern Dwina; and the grand-duchy of *Kief*, which, from its being formerly the seat of the central power, exercised a

sort of supremacy over the others. Novgorod, however, from its size and remoteness, as well as from certain privileges which had been granted to it by Jaroslav, was almost independent of the grand-duchy. The citizens of Novgorod chose their own dukes, archbishops, and in general all their dignitaries, and proved the superiority of their system of self-administration by increasing in power and wealth year by year. One of the chief factories of the great Hanseatic League was established in Novgorod in the 13th century. In fact, so great was its fame throughout R., as to give rise to the proverb, 'Who can resist God and the mighty Novgorod.' The princes of these states had each his standing army, and were continually quarrelling; but the people were less oppressed than would naturally be expected under such circumstances, on account of the establishment in each state of a 'common council' or *veche*, which exercised an important influence in state affairs, and without which the prince was almost powerless. This period was also marked by the gradual amalgamation of the different Slavonic races into one, the present Russian race, a process doubtless aided by the universal dissemination of Christianity, which assimilated their various languages, manners, and customs. The chief of the grand dukes of Kiev were *Vladimir*, surnamed '*Monomach*' (1113—1125), whom chroniclers are never tired of lauding as a model prince, and one whose authority was acknowledged almost as paternal by the princes of the other provinces. In 1163, the ruler of Vladimir took possession of Kiev, and proclaimed himself grand duke. In 1222, the Mongol tide of invasion had swept westwards to the Polotza, a nomadic tribe who ranged over the steppes between the Black Sea and the Don, and whose urgent prayers for aid were promptly complied with by the Russian princes; but in a great battle, fought (1223) on the banks of the Kalka (a tributary of the Sea of Azov), the Russians were totally routed. The Mongol invasion, did not follow up their victory; but twelve years afterwards, Batu Khan, at the head of half a million of Kiptchak Mongols, conquered the east of Russia, destroying Riazan, Moscow, Vladimir, and other towns. The heroic resistance of Prince George of Vladimir cost the lives of himself and his whole army on the banks of the Sit. The Mongol conqueror's victorious career was, however, arrested by the impenetrable forests and treacherous marshes to the south of Novgorod, and he was forced to return to the Volga. In 1240, he ravaged the south-west, destroying Tchernigof, Galich, and Kiev; ravaged Poland and Hungary, defeating the Poles at Wahlstatt, and the Hungarians at Munkacs, but being checked in Moravia, and receiving at the same time the news of the khagan's death, he retired to Sarai on the Akhtuba (a tributary of the Volga), which became the capital of the new khanate of Kiptchak. Thither the Russian princes repaired to swear allegiance to the khagan, and take part in the humiliating ceremonies which the barbarous conqueror exacted from his tributaries. The taxes of R. were farmed out by the khagan's contractors, who were generally oriental merchants, and they were collected by the aid, when necessary, of the khan's soldiers. But in later times (from the most of the 14th and 15th centuries), when the fiery energy of the Mongols was on the decline, the taxes were collected by the Russian princes and sent to Sarai. The Mongol invasion had a very evil influence on the political, social, and commercial life of R.; it totally destroyed the elements of self-government, which had already attained a considerable degree of development, arrested the progress of industry, literature, and the other elements of civilisation, and threw the country

more than 200 years behind the other states of Europe. The principalities of Kief and Tchernigof never recovered this crushing blow, and the seat of the metropolitan was removed to Vladimir. Their decline, however, made room for the rise of Galicia to pre-eminence in Western R., and under the rule of a series of wise princes it preserved greater independence than any of the Russian principalities, till, in the latter half of the 13th c., it was taken possession of by Kasimir III. of Poland; and about the same time Volhynia was joined to the grand-duchy of Lithuania. The rise of this latter state was much favoured by the prostration to which the Russian princes were reduced by the Mongol invasion, and after a flourishing existence of several centuries, during which it extended in power, so as to include Livonia proper, and the Russian provinces of White R., Volhynia, Podolia, and the Ukraine, it was joined in 1569 to Poland. On the north of Lithuania arose in the beginning of the 13th c. another power, the Livonian Knights Sword-bearers, who took possession of Livonia, Courland, and Esthonia, as well as some portions of the territory of Novgorod and Pskov. The grand-ducal title passed after the Mongol invasion from Kief to Novgorod, and afterwards to Vladimir, where the celebrated Alexander Nevsky (q. v.) (1252-1263) waved the sceptre. In the beginning of the 14th c. Eastern R. consisted of the principalities of Novgorod, Nijni-Novgorod, Tver, Riazan, and Moscow, and long and bloody contests took place between the two most powerful of these, Tver and Moscow, for the supremacy. At last, under the guidance of Ivan Kalita (1328-1340), the founder of the system of administrative centralisation which prevailed even to the time of Peter the Great, Moscow became the chief grand-duchy. This result was due to various causes, of which the central position of Moscow, the prevalence there of the law of primogeniture, the favour of the Mongol khan, the sympathy of the church, whose head the metropolitan had removed thither from Vladimir in 1325, and the weakness of most of the other princes, were the chief. Ivan's son and successor, Simeon the Proud (1340-1353), followed in his father's footsteps, as did also the regency which administered the government during the reign of the weak-minded Ivan II. (1353-1359), and the minority of his son, Dmitri (1359-1389). Dmitri conquered Nijni-Novgorod, carried on war with success against Tver and Riazan, and profited by the weakness of the Mongol khanate, which was now divided into the various hordes of Nagaisk, Crimea, Kazan, and Astrakhan, to make the first attempt to shake off the shameful yoke under which the Russians had laboured so long. His brilliant victory over the Khan Mamai on the banks of the Don (1380), which conferred on him the epithet of Donakoi, was the first step to liberation; but the succeeding khan, Taimur, revenge, burned Moscow, exacted a heavy tribute from the people, and rivetted their bonds more firmly than ever. Vassili I. (1389-1425) obtained recognition of the principality of Nijni-Novgorod with the full consent of the khan, and conquered Novgorod and Murom. During his reign, R. was twice invaded by the Tartars, first under Timur, and then under Edijel, and was at the same time attacked by the Livonians. Vassili II. the Blind (1425-1462) reigned during a period marked with continual civil wars among the various princes for the grand-ducal throne; but from this period the power of power in Eastern R. rapidly disappeared, eternal troubles ceased, and the re-united realm emerged from union the power of casting off the barbaric yoke. These results were achieved by Ivan

III. (1462-1505), surnamed 'the Great,' who availed himself of every opportunity for abolishing the petty principalities which owed him allegiance as grand-duke, and manœuvred so skilfully, that some of the princes voluntarily surrendered their rights, others bequeathed their lands to him; while others, as the prince of Tver, were reduced by force of arms. The heaviest task of all, however, was the reduction of Novgorod, but so vigorously did Ivan carry out his schemes, that in 1478 this last of the great principalities was added to his empire. He then took advantage of the dissensions between Achmet, khan of the Golden Horde, and Mengli-Gherai, khan of the Crimean Horde, to deliver R. from its state of servitude by uniting with the latter; their combined arms destroying the power of the former in 1490; and the kingdom of Astrakhan, which rose on its ruins, was wholly unable to cope with the now powerful monarchy. He next turned his attention to the western provinces, which had formerly belonged to the descendants of St Vladimir, but were now in the hands of the Lithuanians, under whom the adherents of the Greek Church were bitterly oppressed by the Catholics, and accordingly hailed the advance of Ivan's army as a deliverance from persecution. The battle which followed was in favour of the Russians, but was productive of no results of any importance. Ivan married (1472) Sophia, a niece of Constantine Palæologus, the last Byzantine emperor, and introduced the arts of civilisation through the medium of architects, founders, coiners, miners, &c., whom he brought from Italy, and the result of whose labours is seen in the Kremlin and the Cathedral of the Assumption (Ouspenski Sobor). He also fortified many towns, introduced to his court the splendour of Byzantium, assumed the title of Czar of all the Russias, adopted the arms of the Greek empire, and united the existing edicts into a body of laws, the *Soudebnik*. Vassili III. (1505-1533) followed closely his father's policy, made war upon the Lithuanians, from whom he took Smolensk, and incorporated with his dominions the remainder of the small tributary principalities. His son, Ivan IV. (1533-1584), known afterwards as 'The Terrible,' became monarch at the age of three years, and the country during his long minority was distracted by the contentions of factious bojars who strove for power. Fortunately, however, on his attaining his majority in 1547, he found two wise and prudent counsellors, Sylvestre and Adascheff, who, along with his queen, Anastasia Romanoff (see ROMANOFF), exercised over him a most beneficent influence. The interior administration was remodelled, the 'soudebnik' of his grandfather was reformed and amended, the *streltzi*, the first standing army in R., were established, and printing introduced. His arms were everywhere victorious; the strongly fortified city of Kazan was captured in 1552, and the kingdom of which it was the capital was annexed to his empire, and the kingdom of Astrakhan shared the same fate soon after. The marauding Tartars of the Crimea were held in check, and the Knights Sword-bearers attacked and driven from Livonia and Esthonia. About this time a remarkable change came over Ivan's character, which seems to have been in some way connected with the death of his wife, Anastasia. He became suspicious of every one, believed himself surrounded with traitors, banished his two counsellors, Sylvestre and Adascheff, and persecuted the bojars, many of whom perished on the scaffold, while others fled to foreign countries. His insane rage fell upon whole towns; thousands of people were destroyed in Tver, Novgorod, and Moscow; and, finally, he murdered his eldest son. Stephen

Bathory, king of Poland, meantime wrested Livonia from him, and the Crim-Tartars made an irruption northwards, and burned Moscow. It was during the reign of this monarch that Western Siberia was conquered for R. by the Cossack Ermak. See SIBERIA. His son, *Feodor* (1584—1598), was a feeble prince, who intrusted his brother-in-law, Boris Godounov, with the management of affairs. Godounov was a man of rare ability and intellect, and proved himself an able administrator. The Russian dominion in Siberia was consolidated, numerous towns and fortresses were erected in the south as barriers against the Crim-Tartars, the Greek Church in R. was declared independent of the patriarch of Constantinople. Feodor was the last reigning monarch of the house of Rurik, for he died childless, and his only brother, Dmitri, was murdered in 1591 by order of Godounov, according to popular rumour. After the death of Feodor, representatives of all classes were convoked at Moscow to elect a new sovereign, and their choice fell on *Godounov* (1598—1604). The mysterious death of Prince Dmitri favoured the appearance of pretenders to his name and rank, the first of whom, a supposed monk of the name of Gregory Otrepiëff (see DEMETRIUS), was defeated by Godounov, but on the sudden death of the latter he was crowned in 1605. A revolt, headed by Prince *Vassili Shouisky* (1606—1610) soon broke out, the czar was murdered, and Shouisky elevated to the vacant throne. But a second false Dmitri now appeared, and Sigismund of Poland, taking advantage of the confusion thus produced, invaded R., proclaimed his son Vladislav czar, and took possession of Moscow (1610), carrying away the czar to die in a Polish prison. At the same time hordes of Tartars, predatory bands of Poles, and gangs of robbers devastated the provinces, and the wretched country was reduced almost to the verge of complete disorganisation. But the clergy nobly stood forth to save the state from ruin, and Minin, a common citizen of Nijni-Novgorod, so worked up the feelings of his fellow-citizens that they volunteered for military service, and chose as their leader the Prince Pojarsky, a man of distinguished valour. Pojarsky retook the capital, drove the Poles out of R., and convoked an assembly of representatives, who unanimously chose for their czar *Michael Feodorovich Romanoff* (1613—1645). See ROMANOFF. The first care of the new monarch was to put an end to the revolt of the Don Cossacks, who had set up the son of the first false Dmitri as czar, and to the depredations of the robber-gangs in the south-west of Russia. In 1617, he concluded a treaty with Sweden, by virtue of which that power received the coasts of the Gulf of Finland and a considerable pecuniary indemnity, in consideration of Philip, the brother of the Swedish monarch, renouncing his claims to the Muscovite throne. In 1618 and 1634, he purchased peace from the Poles at the cost of Smolensk and a portion of Seversk. Having thus freed himself from all danger of foreign interference, he directed his attention to the internal administration, which, especially the courts of justice, was reduced to a deplorable condition, and to aid him in this necessary task, he summoned a general council of representatives at Moscow. *Alezei* (1645—1676), his son and successor, being a minor, the nobles seized the opportunity of increasing their power and exercising oppression and extortion over their inferiors, till rebellions broke out in various districts. Other causes of discontent were the heaviness of the taxes, the oppression of the serfs, the depreciation of the currency, which was changed from silver to copper, and the secession from the Russian Greek Church of those who disapproved of the changes and corrections in the

books and liturgy of the church introduced by the patriarch Nikon. These malcontents were accordingly persecuted, and fled, some to the north of R. and others to the Ukraine, where they founded many colonies, and still exist apart under the name of 'Old Ritualists' (*Staro-obriadzy*). A general council which was now convoked to deliberate on the means of restoring peace to the country, revised the existing laws, and composed (1649) a new code—the 'Sobornoe Ulozhenie,' which granted to every subject the right of direct appeal to the czar. Till on the highways were abolished, the English and other foreign merchants were deprived of the privilege of free-trade with R., and the silver currency reintroduced. The chief events in foreign policy were the acquisition of Little Russia, by the voluntary submission of the Cossacks (see POLAND); a consequent war with Poland, in which R. acquired Smolensk and the greater part of White Russia; and a war with Turkey, which continued till after the accession of *Feodor* (1676—1682), when it was terminated (1681) by the treaty of Bakhchisarai, by which Turkey gave up all claims to Little Russia. After Feodor's death, the general council of the land, in accordance with his last wishes and their own predilections, chose his half-brother Peter as czar, but his half-sister Sophia, an able and ambitious princess (see PETER THE GREAT) succeeded in obtaining the reins of power as regent. She concluded peace with Poland in 1686, and two unsuccessful campaigns against the Tartars in the Crimea; and after an attempt to deprive Peter of his right to the throne, and failing that, to assassinate himself and his mother, she was forced to resign all power and retire to a convent, where her accomplices were executed; and PETER (1682—1725) ascended the throne as sole ruler, his brother Ivan being allowed to retain the title of czar conjointly, and to appear as such at public ceremonies, but without any real authority. In order more fully to discover the importance of the changes wrought by Peter in R., a brief retrospect of its social and political condition at the time of his accession is necessary. At the time the government stood the czar with absolute power in administrative, judicial, and military affairs; the exercise of authority he was aided by his council, the 'Bojarskaia Douma,' and in cases of emergency by a general council of representatives of the people, which latter, however, possessed only a right of deliberation. The criminal code was in the extreme. Of the standing army there was only the name. The population was divided into two great classes, the *boyars* or nobles, who were bound to render service to the crown, and the *burghes* or industrial and mercantile classes, and *serfs*, who were bound to the land. The clergy exercised great influence over all the political functions. Agriculture was at a low state, and the few manufactories and industrial establishments were in the hands of foreigners. Commerce and learning, which had been introduced during the confederative period, had never recovered the ground they had received from the Mongol invasion. In later times they entered R. through the efforts of Novgorod with the Hanse League, and through intercourse with Poland, though they never reached the rural population or the lower classes. Education even of the higher classes was almost unknown, and reading and writing, and the first school of letters and theology only made its appearance at the end of Feodor's reign. Fine arts were limited to architecture and painting (of sacred subjects) in the Byzantine school. The first newspaper was published in Moscow, and the first theatre was established

during the reign of Alexis. The degraded condition of civilisation and the Oriental influence of the Mongols left powerful traces on the domestic manners and habits of the Russians, among which was the despotic authority of the father over his household, and the low position of women in domestic life; those of the lower ranks being mere slaves, while those of higher rank were completely excluded from social intercourse with the other sex, and were condemned to pass a dull and dreary existence in their 'terema.' Marriages were concluded by the parents without the consent of the bride and bridegroom.

The history of R. during Peter I.'s reign is merely a biography of that monarch, and under his name is given a brief sketch of the numerous and important improvements effected by him in the government and civilisation of his subjects. It must, however, be noted, that in the trying out of his well-meant schemes, he seldom consulted the national character of his people, or the natural conditions of the country; and consequently, when the irresistible pressure of his high intellect and indomitable will was withdrawn, it was found that, in great part, the civilisation which he had forced upon his subjects was but skin-deep. In accordance with the terms of his will, his second son, *Catharine I.* (q. v.) (1725—1727), succeeded him, though the old or anti-improvement part of the nobility supported the claims of the only son of the unfortunate Alexis (q. v.), *Peter II.* (q. v.) (1727—1730), who soon after obtained the imperial throne. The reigns of both of these sovereigns were occupied with court quarrels and intrigues, *Menchikow* (q. v.) being the former, and *Dolgorouki* during the latter, being the real rulers. On the death of Peter II., the privy council, setting aside the other claimants of Peter I., conferred the crown on *Anna* (q. v.), Duchess of Courland, the daughter of him. Her reign (1730—1740) was marked by the dominance of the German party at court, who, checked by the weak sovereign, treated R. as a great emporium of plunder, and the Russians as barbarians (see *BIRON*). Under their influence, R. ceded to Persia (q. v.) her lost Caspian provinces, and was led into a war with Turkey, which was productive of nothing but an immense loss of men and money. Her successor was *Ivan* (1740—1741), son of her niece, *Antonia*, the Princess of Brunswick; but he was speedily dethroned by *Elizabeth* (q. v.) (1741—1762), the daughter of Peter I., who revived the German party of the influence it had so cruelly abused, restored the senate to the power to which it had been intrusted by Peter the Great, abolished a regular system of recruiting, abolished the duties on imports. During her reign, French influence was paramount, and the usage of that nation supplanted German at court. Gained by the treaty of Abo (1743) a portion of Finland, and took part in the *Seven Years' War* (q. v.). *Elizabeth's* nephew and successor, *Peter III.* (q. v.) (1762—1762), put a stop to all interference with the quarrels of Western Europe, and introduced some commendable ameliorations of the oppressive elements of his predecessors; but he was speedily dethroned by his able and unscrupulous consort, *Catharine II.* (q. v.) (1762—1796), ascended the throne, and proved herself the greatest sovereign R. after Peter I. Her successful wars with Turkey, Persia, Sweden, and Poland, largely extended the limits of the empire; and while by her high policy protecting her subjects from external invasion, she as little forgot the necessity for internal reforms. The laws and administrative arrangements were revised, and the empire was divided into governments (an arrangement which,

with very slight modification, still subsists), each government being under a separate administration, both as to matters of polity and justice. Her son and successor, *Paul I.* (q. v.) (1796—1801), at first, through apprehension of the revolution in France, joined the Austrians and British against France, but soon after capriciously withdrew, and was about to commence war with Britain, when his assassination took place. He gave freedom of worship to the 'Old Ritualists,' which till this time had been withheld; but he also established a severe censorship of the press, prohibited the introduction of foreign publications, and organised a secret police. His eldest son, *Alexander I.* (q. v.) (1801—1825), was at the outset desirous of peace, but was soon drawn into the vortex of the great struggle with France, in which he played a prominent, although at one period an inconsistent, part, and raised R. to the first rank among European States. The character of his rule and the internal improvements he effected are sketched under his name; and an outline of the warlike operations is given in the article *NAPOLEON*. The Holy Alliance (q. v.) and the example of conservative policy set by Austria, exercised a pernicious influence on the latter part of his reign; and the higher classes, who had looked for the introduction of at least a portion of the liberal institutions they had seen and admired in Western Europe, became so dissatisfied, that when his youngest brother, *Nicholas I.* (q. v.) (1825—1855), from whom they had nothing to hope, succeeded, they broke out into open rebellion, which was speedily crushed. A full stop was now put to the rapid advance of R.'s prosperity; wars were declared with Persia and Turkey; and a long and deadly struggle commenced with the Caucasian mountaineers—all for the ill-concealed object of extending Russian domination; and the cession of Erivan and Nahituvan by Persia, of the plain of the Kuban, of the protectorate of the Danubian principalities, and of the free right of navigation of the Black Sea, the Dardanelles, and the Danube by Turkey, only whetted his appetite for more spoil. In 1830, he converted Poland (q. v.) into a Russian province; in 1849, he officially aided Austria in quelling the insurrection of the Magyars; and in 1853, his almost irresistible craving for more territory led him (being, in all probability, under the impression that Turkey would stand alone, as she had always done hitherto) into the Crimean war, in which, though the allies, Britain, France, and Sardinia, did not obtain any decided success, R. suffered immense loss of military prestige on the Danube, at Silistria, the Alma, and before Sebastopol, and was almost drained of her vast resources of men and money. The accession of *Nicholas's* son, *Alexander II.* (1855)—one of whose first acts was the conclusion of the peace of Paris (1856), by which R. lost the right of navigation on the Danube, a strip of territory to the north of that river, and the unrestricted navigation of the Black Sea—has been the signal for the revival of those schemes of reform which had been crushed so despotically by the late czar. *Alexander's* first great reform was the abolition of serfdom, which created 14 millions of new free citizens. Corporal punishment, and the farming-system of the indirect taxes, were also abolished; and the judicial power was separated from the administrative, and founded on trial by jury. The insurrection in Poland (q. v.), in 1863—1864, was suppressed with extreme severity; and in 1868 the last relics of Polish independence disappeared in the thorough incorporation of the kingdom with the Russian Empire. The subjugation of the Caucasus was completed in 1860. Successive expeditions, the last of which was that against Khiva in

1873, have resulted in the establishment of Russian supremacy over all the states of Turkestan. The traditional policy of Russianising all non-Russian subjects has been persistently adhered to in the Baltic provinces, not without protests. Most important of recent Russian measures, in relation to other European states, was the forwarding in 1870 of a despatch to the powers that were parties to the treaty of Paris, in which it was announced that Russia regarded itself as no longer bound to observe those stipulations that provided for the neutralisation of the Black Sea; and at a diplomatic conference, held in London in January 1871, the Russian claims were for the most part acceded to.

RUSSIAN CHURCH, the community of Christians subject to the emperor of Russia, using the Slavonic liturgy, and following the Russian rite. The early history of the R. C., as a distinct national community, is involved in much obscurity. That Christianity had been introduced into Russia before the middle of the 9th c., must be inferred from one of the letters of Photius, written in 866; but its diffusion was very limited. Even the prospect which, in the middle of the 10th c., was opened by the conversion and baptism of the Princess Olga (q. v.), was but slowly realised. Her son, Swtislav, sturdily resisted the representations of his Christian mother and the missionaries; nor was it till the alliance of Wladimir with the court of Byzantium, by his marriage with Anne, sister of the Emperor Basil II., and his baptism in 988, that the foundation of Christianity can be said to have been regularly laid in Russia. Nicholas Chrysobergos, patriarch of Constantinople, taking advantage of the occasion, sent a bishop and a number of priests, by whom a number of the people were baptised in an incredibly short space of time, 20,000, it is said, having received baptism in a single day. At this time, Constantinople being in communion with Rome, the R. C. was also subject to the same jurisdiction; and although, in the schism under Michael Cerularius, the R. C. naturally followed silently in the train of Constantinople, yet, it would appear that at the time of the Council of Florence (1439), the adherents of the Roman Church throughout Russia were as numerous as those of the Greek party. The complete separation of the R. C. from Rome was effected by an archbishop of Kiev, named Photius, in the latter part of the same century.

For more than a century from this date, the R. C. continued directly subject to the patriarch of Constantinople; but in the year 1588, the patriarch Jeremias being in Russia, held a synod of the Russian bishops, and erected the see of Moscow into a patriarchate, with jurisdiction over the entire territory; this decree being afterwards confirmed by a synod held at Constantinople. This dignity, however, was subordinate to the patriarch of Constantinople, and the subordination was acquiesced in down to the reign of Alexis Michaelowitz, father of Peter the Great, when the patriarch of Moscow, Nikon, refused to acknowledge it further. The pretensions of this prelate, and of his successors, however, gave offence to the czar, and one of the first among the great schemes for the reorganisation of his empire, conceived by Peter the Great, was the suppression of the patriarchate, and the direct subordination of the church to the headship of the emperor. He took his measures, nevertheless, with great deliberation, and on the death of the patriarch Adrian, in 1700, he contented himself with not filling up the vacant dignity, appointing in the meantime as acting director of ecclesiastical affairs, a bishop, with the title of Exarch, by whom all matters of importance were to be referred, either directly to the czar, or to a council of bishops, who

held their sittings at Moscow. After an interval of 20 years, the public mind having been taught to forget the patriarchate, that office was formally abolished in 1721; and the permanent administration of church affairs was placed under the direction of a council, called the 'Holy Synod,' or 'Permanent Synod,' consisting of archbishops, bishops, and archimandrites, all named by the emperor. Under the direction of this council, a series of official acts and formularies, and catechetical, doctrinal, and disciplinary treatises was drawn up, by which the whole scheme of the doctrinal discipline, and church government of the R. C. was settled in detail, and to which all members of the clergy, and all officials and dignitaries, are required to subscribe. The leading principle of the new constitution thus imposed in the R. C. is the absolute supremacy of the czar; and in order to mark still more signally the principle that the czar is the source of all church dignity and of all ecclesiastical jurisdiction, the arrangement of provincial archbishoprics, and bishoprics underwent a complete revision; the old metropolitan sees, as they became vacant, were filled up with simple bishops, and not with archbishops as before; and a new arrangement of archbishoprics was established partly by the act of the czar himself, partly by the interposition of the permanent synod.

The constitution of the R. C. established by Peter has been maintained in substance to the present time. The Holy Synod is regarded as one of the great departments of the government, the Minister of Public Worship being *ex officio* a member. One of the most cherished objects of the traditional imperial policy of Russia, has been to effect a uniformity of religious profession throughout the empire. Dissent in all its forms, has not only been discouraged, but in many cases rigorously and even cruelly repressed, and as the Roman Catholic dissentients from the R. C. form the most numerous, and the most formidable class, they have generally, but more particularly under the late Czar Nicholas, been the objects of especial severity.

As regards doctrine, the R. C. may be regarded as identical with the common body of the Greek Church (q. v.). With that church the R. C. rejects the supremacy of the pope, and the double procession of the Holy Ghost. All the great leading characteristics of its discipline, too, are the same as the differences of ceremonial which exist, although in many cases considered by the Russians to be of themselves of vital importance, being too minute to permit our entering into the detail. There is one point, however, which some explanation may be required. The liturgy of the R. C. is the same as that of the church of Constantinople; but it is celebrated not in Greek, but in the Slavonic language. The service books, however, are not in the modern Russian, but in the ancient language, such as when they were originally translated, with the exception of the modification which they underwent at the time of the patriarch Nikon (see RASKOLNIK, PHILIPPUS), and the further revision under Czar Peter. The discipline, as to the marriage of the clergy, is the same as that described for the Greek Church; and in carrying out the law which enforces celibacy upon bishops, the Russians adopt the same expedient with the Greeks, viz., of selecting the bishops from among the monks, who are celibates in virtue of their vow.

Besides the established R. C., there exists also in Russia a not inconsiderable body of dissenters of various kinds. One class of these has been already described under the head Raskolniki. But by far the most numerous dissenters are the Roman Catholics, who are found chiefly in Poland and White Russia. At the partition of Poland, a special provision was made

for the Roman Catholic people of Poland, under the new government, by the erection of an archbishopric in communion with Rome, at Mohilew, in 1783; and the organisation was still more formally completed by the czar, Paul, who established, in 1798, five bishoprics under that metropolitan see; and the arrangements of the Congress of Vienna having somewhat deranged these ecclesiastical dispositions, a new arrangement was entered into by Pius VII. in 1818. But it cannot be doubted that the whole policy of the Russian government, in reference to the church, makes it almost impossible that they should permit free exercise of worship and of thought to be Catholics in communion with Rome. The direct legislation, and still more the practical administration of Russia in Poland, in reference to marriage, to church property, to conventual establishments, and to ecclesiastical regulations generally, has been a policy of repression and of compulsory proselytism. This policy has been more sedulously pursued since the recent reorganisation of Poland. In 1867, the archbishopric of Warsaw was abolished, and all the Roman Catholics of the empire were made subject to the archbishop of Mohilew.

According to the *Statistical Year-book of the Russian Empire* for 1871, the orthodox adherents of the R. C. exceeded 53,000,000, while the Raskolniks were nearly 1,000,000. There were almost 40,000 officiating priests. The Roman Catholic Church numbered nearly 3,000,000 in Russia, and upwards of 4,000,000 in Poland.

RUSSIAN LANGUAGE AND LITERATURE. Russian, a principal member of the Slavic family of languages, first became a written language at the time of Peter the Great, till which period the Old Slavic—the language of the Church—had been the only medium of literary expression, and had, in consequence, exercised an important influence on the Russian popular speech, as on that of other Slavic dialects. The Mongol conquest, and the preponderance of Polish elements in the western parts of the empire, have also introduced into the Russian language a great number of Mongolian and Polish expressions; in addition to which, the efforts of Peter the Great to give his subjects the benefits of western culture, have enlarged the Russian vocabulary, especially in arts and industry, with numerous German, French, and Dutch words. The chief characteristics of Russian, as a language, are simplicity and naturalness. The grammatical connection of sentences is slight, and the number of conjunctions scanty. Perspicuity and expressiveness are obtained by the freedom allowed in the placing of words. Auxiliary verbs and articles there are none; while personal pronouns may or may not be used along with verbs. The vocabulary of Russian is very rich—foreign words being, so to speak, Russianised. The capability of the language in forming compounds and derivatives is so great, that from a single root not less than 2000 words are sometimes derived. The purest and most grammatical Russian is spoken in the centre, about Moscow. The oldest Russian Grammar is that of Wolf (Oxf. 1696); others are the Grammars of the Petersburg Academy (1802), of Gretsch (Petersb. 23; new ed. 1834), and of Vostokov (10th ed. Petersb. 1859). A *Russian Grammar for Englishmen* was published at St Petersburg in 1822, and another (by Heard) in 1827. The best Dictionaries are those of the Russian Academy (4 vols. Petersb. 1807), of Heym (1803—1805), of Schmidt (Lps. 1815), of Kop (4 vols. 1825), Sokolov (Petersb. 1834), Reiff (1862), and Paulovski (1859). There is an English-Russian grammar and dictionary by Constantinoff (4 vols.).

The beginnings of Russian literature are contemporaneous with the introduction of Christianity by

the missionaries Cyril (q. v.) and Method, who employed the Old Slavic church-tongue for literary purposes. To this earliest period belongs—besides the *Pravda Ruskaja*, a book on law—the noted history or chronicle of Nestorius. After the subjugation of Russia by the Tartars, knowledge withdrew into the shelter of the monasteries, whence proceeded several important historical works. During this period of foreign domination, the Russian people seem to have sought consolation and hope in writing patriotic ballads and songs about their great hero-king, Vladimir (q. v.)—the Russian Charlemagne—the most celebrated of which is *Igor's Expedition against the Polowzi* (Berl. 1855). When at length the country was freed from the oppression of the Mongols by Ivan I., in 1478, Russian literature received a fresh impulse, but so tardy, nevertheless, were its motions, so circumscribed its achievements, that, up to the commencement of the 18th c., the only notable names that can be mentioned are the metropolitan Makarius (died 1564), who wrote *Lives of the Saints*, &c.; Zizania, the author of a Slavic Grammar (Wilna, 1596); and Matviejev (17th c.), who composed several historical and heraldic works. The czar, Alexei Michailovitch (whose prime-minister Matviejev was), caused a valuable collection of Russian laws to be printed in 1644, and shortly after founded an academy at Moscow, in which grammar, rhetoric, poetry, dialectics, philosophy, and theology were taught. But from political causes, the Polish element now began to predominate in Russian literature, and continued to do so, more or less, until the time of Peter the Great, who made his native language the universal vehicle of communication in business and writing. He established schools and founded the famous St Petersburg Academy. During his reign, the metropolitans Demetrius (b. 1651—d. 1709) and Javorskij (b. 1658—d. 1722); the archbishop Prokopovitch (1681—1736); Sellij (d. 1746); the national historian Tatishchev (1686—1750); the poets Kantemir; and the Cossacks, Klimovskij and Danilov; were the most distinguished supports of literature. The first to place on a firm basis the Russian metrical system, was Trediakovskij (1703—1769). In the period that followed the death of Peter, the writer that exercised the strongest influence on Russian literature was Lomonossov, who first drew the lines of distinction sharply between old Slavic and Russian, and established the literary supremacy of the dialect of Great Russia. Among his successors, the poet Sumarokov (1718—1777) did great service in the development of the Russian drama; so did Kniazhnin (1742—1791), whose pieces still keep their place on the Russian stage; while Wizin (1745—1792) ranks as one of the first prose writers of his age. Some of his prose comedies are full of the most genuine humour. Other notable names in poetry, belonging in whole or part to this period, are Chersakov, Oserov, Prince Michailovitch, Dolgoruki, Chvostov, Petrov, Bogdanovitch, and Derzavin (q. v.), the first universally popular Russian poet. Prose literature, however, developed itself more slowly. Lomonossov was for a long time the model that was followed. Among the first to make a fresh reputation, were Platon, the metropolitan of Moscow, and Lewanda (1736—1814), archpriest of Kiev; who distinguished themselves from the mass of their bombastic brethren by the strength and vigour of their thinking; the historians Schtsherbatov (1733—1790), Boltin (1735—1792), and Muraviev (1757—1807). Still more important, in the same department, were the labours of the German, Gerh. Friedr. Müller, a native of Westphalia, who, in 1755, established at St

Petersburg the first literary journal. Novikov (1744—1818) gave a powerful stimulus to the book-trade and to literary productivity, partly by his professional zeal, and partly by the publication of a satirical journal, entitled *The Painter*, which was widely read.

A new epoch in Russian literature commenced with Alexander I., who was enthusiastic in the cause of education and progress. The number of universities was raised to seven; learned societies were also increased. The great ornament of literature at this period was Karamsin (q. v.), who freed it from the trammels of the pseudo-classicism, within which it had been confined by Lomonossov. His labours were continued by Dmitriev and Batjushkov, while Shishkov combated with success the tendency to deprive the language of its Slavic character; and in the poetry of Shakovski, the national elements again re-asserted themselves. Along with these may be mentioned the historian Bolshovitihev (1767—1837) and the theologian Drodov, archbishop of Moscow; the poets Koalov, Prince Alexander, Shachovaki (d. 1846), one of the best comic authors of Russia, and possessed of amazing fertility; Gribojedov, Glinka, Prince Vjassemaki (b. 1792), a celebrated song-writer, elegist, and critic; Davidov, and Gnieditch. Meraljakov, who died a professor in Moscow, was a very able critic; while Chernicer (1744—1784) and Krylov (1768—1844) rank first among the original fabulists of Russia. Bulgarin and Gretsch belong rather to the most recent period of Russian literature—a period characterised by the predominance of Russian influences, and the complete absorption into the one national spirit of all minor and foreign elements. The late czar Nicholas laboured with his wonted passionate energy in this direction. Among the poets of this thoroughly Russian period, the most conspicuous and brilliant is Pushkin (q. v.), whose verses are a mirror of Russian life, in which we see shadowed forth the joys and griefs, the humour and the patriotism of the true Russian peasant. The most remarkable of Pushkin's contemporaries and successors are the poets Baratynski (d. 1844), Baron Delvig, Benediktov, Podolinski, and Lermontov; the dramatists Nikolaus Polevoi and Nestor Kukolnik, who drew the matter of their dramas from the national history; and Gogol (q. v.), one of the most illustrious names in Russian literature. Russian novels exhibit a condition of society in which barbarism struggles for supremacy with a superficial civilisation. The best writers in this department are Bestushev, Bulgarin, Sagoekin, whose most popular work, *Jury Miloslavski, or the Russians in 1812*, is modelled after the historical manner of Sir Walter Scott; Vasili Ushakov, author of *Kirgis-Kaisak*, &c.; Count Solohub, whose novels give a graphic picture of St Petersburg society; Prince Odojevski, Baron Theodor. Korff, Konst. Masalski, and Senkovski, reckoned one of the first journalists in Russia; nor must the name of Alexander Herzen (q. v.), the 'liberal Russian' exile, be omitted. The delineations of Cossack life are too numerous for special notice, but they constitute quite a distinct section of the literature of Russian fiction, and are composed for the most part in the dialect of Little Russia. Great attention has also been paid in Russia, as in all Slavic countries, to popular songs and proverbs. The principal collections of these are by Novikov, Kashin, Maximovitch, Makarov, and Sacharov. The latest developments of Russian literature have been chiefly in the department of history, and among the most distinguished names are those of Professor Ustrialov of St Petersburg, Professor Pogodin of Moscow, Polevoi, Vasili Berg

(d. 1834), Lieutenant-general Michailovski Dani-levski, Professor Snajegirev, Sreznevski, Slovov, Samailov, Solovjev, Strovjev, Neverov, and Arzenjev. Such philosophy as exists in Russia is mainly an echo of the modern German school, and therefore possesses no particular originality. Advances in theology are hardly to be looked for as yet from a church so deeply sunk in ignorance and intellectual stupor as the Russian, yet nowhere is reform more urgently required. As writers in jurisprudence, Nevolin, Moroshkin, Spassovitch, deserve mention; amongst mathematicians, Simonov, Perevoschtschikov, Wesselovski; amongst physicists, Turtschaninov, Metachnikov, Sokolov, Kutorga, Kokscharov; and as linguists, Vostokov, Biliarski, Buslajev. See Borg, *Poetic Works of the Russians* (Ger., 2 vols.; Riga, 1823); Gretsch, *Extracts from the Poets and Prose-writers of Russia* (St Petersburg. 1821); Gretsch's *History of Russian Literature* (Petersb. 1822); Jevgenij, *History of Russian Literature* (Petersb. 1818—1827—1838); König, *Literary Pictures from Russia* (St Petersburg. 1837); Otto, *Text-book of Russian Literature* (Lps. 1837; translated into English by Cox, Oxford. 1839); Jordan, *History of Russian Literature* (Lps. 1846); and Talvi (Mrs Robinson), *Historical View of the Languages and Literature of the Slavic Nations* (New York, 1850).

RUSSENIKS, also RUSSINS and RUTHSKI, the name of a variety of peoples who form a branch of the great Slavic race, and are sharply distinguished from the Muscovites, or Russians proper, by their language and the entire character of their life. They are divided into the R. of Galicia, Ruthenia, Hungary, Podolia, Volhynia, and Lithuania, &c. They are estimated by Schafarik at 13,000,000. They are almost all agriculturists, and, on the whole, rather uncultivated. Before the 17th c. they were a free race, but were then subjugated, partly by the Lithuanians, partly by the Poles, and for a long time belonged to the Polish kingdom. Their language has consequently become closely assimilated to Polish. In earlier times it was a written speech, with quite distinctive characteristics, as may be seen from the translation of the Bible, published at Ostrog, in 1581, and from various statutes and other literary monuments still extant. Recently, printing in the Russniak tongue has been recommenced. The R. belong, for the most part, to the United Greek Church, but in part also to the Non-united. They preserve many old customs peculiar to themselves, and much folk-lore, prose and poetic, very like that current in Poland and Servia. This has been collected by Vaclav in his *Piemni Polackie i Ruskie* (Lemberg, 1833). Levicki has published a *Grammatik der Russinischen Sprache für Deutsche* (Przemysl, 1833).

RUSSO-GERMAN WAR, the name given by German historians to the last stage of the great European war against Napoleon, beginning with the Russian campaign of 1812 and terminating on the field of Waterloo. See NAPOLEON.

RUST, the name given to a disease of plants which shews itself on the stems and leaves of many plants, and on the ears of grasses, both of the cereals and grasses, and of many pasture or forage grasses in brown, yellow, or orange-coloured spots; and after destroying the epidermis of the plant, assumes the form of a powder, which soils the fingers when touched. R. seems to consist at first of small masses of one cell, sometimes divided by a transverse wall, belonging to the genera *Uredo* and *Puccinia*, which, finally, breaking through the diseased epidermis, form a coloured dust consisting of conidia spores. The name R. is sometimes restricted to

the *Uredo rubigo vera*, but it is doubted by some if this is not really a young state of a *Puccinia*. Not a few authors regard R. as an eruptive disease (*eranthema*), which makes its appearance chiefly in damp weather, and sometimes extends so far as seriously to injure the plants affected by it, the mycelium and spores which appear in it being regarded as present accidentally, or in consequence of the disease. This, however, is the least probable opinion concerning it.—R. is sometimes very injurious to crops. No remedy is known for it; but it is certain that rank manures tend to produce or aggravate it. See **UREDIO**.

RUSTCHUK, a town of European Turkey in Bulgaria, capital of eyalet of the Danube, and 70 miles west-south-west of Silistria, on the south bank of the Danube, opposite Giurgevo. Its position on a range of hills, with its white chimneys, its mosques and minarets rising from amid forests of fruit-trees, give it a striking and picturesque appearance. It is surrounded by an extended line of fortifications, contains nine mosques, several Greek and Armenian churches, synagogues, and baths. The Danube is here about two miles wide, but its banks are low, and its channel is marked with islets and shallows. It is the most important manufacturing Turkish town on the Danube. The principal articles of manufacture are cloth, linen, leather, muslin, silk and tobacco. Pop. 30,000.

RUSTIC OR RUSTICATED WORK and **RUSTICATION**. The name of that kind of masonry in which the various stones or courses are marked at the joints by splays or recesses. The surface of the stone is sometimes left rough, and sometimes polished or otherwise dressed. Rustication is chiefly used in classical or Italian architecture, although Rustic Quoins (q.v.) are often used in rough Gothic work. In the figure, *a* and *b* shew

Rustication.

forms of rustication usually applied to surfaces; *c* and *d* shew rustic quoins with mouldings on the angles.

RUSTRE, in Heraldry, one of the subordinaries, consisting of a Lozenge (q.v.) with a circular opening pierced in its centre. Ancient armour was sometimes composed of rustres sewed on cloth.

RUTA BAGA. See **TURNIP**.

RUTA OEAE, a natural order of exogenous plants, consisting mostly of trees and shrubs, but containing a few herbaceous plants. The leaves have no

Rutra. are simple and entire, lobed, pinnate, or decompound, and are covered with pellucid resinous dots. The flowers are hermaphrodite, sometimes irregular. The calyx has four or five segments; the petals are equal in number to its segments, or wanting, or are united into a monopetalous corolla; the stamens are equal in number to them, or fewer

by abortion, or twice or thrice as many. There is a cup-shaped disk. The ovary is sometimes stalked; it has as many carpels as there are petals, or fewer; there are generally two ovules in each carpel. The fruit consists of several capsules, cohering firmly or imperfectly.—There are about 400 known species, natives of the warmer temperate and of tropical regions. The *Diosmaceae* are sometimes separated as a distinct order. A bitter taste and powerful odour are general characteristics. Rue, Bucku, and Dittany are examples of the order. See also **ANGOSTURA BARK** and **BRUCEA**. The barks of a number of tropical species, of different genera, possess febrifugal properties.

RUTH, **BOOK OF**, one of the Hagiographa, placed in the Authorised Version, as in the LXX., between Judges and Samuel; and in the Jewish canon, as the second of the five Megilloth, coming after the Song of Songs. It consists of four chapters, and describes how Ruth, the Moabite widow of a Hebrew, Machlon by name, in the time of the Judges, became—by faithful, loving adherence to her mother-in-law, Naomi, for whose sake she had left her home and kindred—the wife of Boaz, and through him the ancestress of David himself. A fragmentary genealogy of David's house—of which the principal links only are given—forms the conclusion of the book, which is characterised throughout by the most naive simplicity, and minute truthfulness of detail. If there be a tendency in the book—which is doubtful—it would naturally be to shew how utterly even that strictest of prejudices, in the mind of ancient peoples, especially the Hebrews, against intermarriage with the 'stranger,' is vanquished by genuine human love and piety; nay, that the heroine of the tale, even a Moabite, was deemed worthy for her virtue to become the foundress of the royal house of Israel. Considering that the Book of Kings contains no details about David's genealogy, this book, apart from its indescribable natural charm, becomes a most useful historical record, and further supplies many items on the forms and domestic customs of a time about which we have such very scant information elsewhere.

The time of the events related mounts back to about a century before David, yet both the contents and tendency of the book shew clearly enough that it was hardly written before the last years of David's reign, if it was at all written in his lifetime. For a change had already taken place in the interval in the manners and customs of the people (cf. the 'in former time,' iv. 7), and the genealogy carried down to David, shews the theocratic significance he had acquired by the time it was written down. Its canonicity has never been questioned in or out of the church.

RUTHENIUM (symb. Ru, equiv. 52, spec. grav. 11.3) is a metal which was discovered in 1843 by Claus in the ore of platinum. In most respects, excepting in its specific gravity, it closely resembles iridium, the coloured reaction of the salts being almost without exception the same in both. For details regarding this metal, which is of no practical importance, the reader may consult Deville and Debray's 'Memoir on Platinum and its Ores,' in the *Annale de Chimie et de Physique*, for 1859.

RUTHERGLEN, or, by popular abbreviation, **RUGLEN**, a royal, parliamentary, and municipal burgh, in Lanarkshire, on the Clyde, three miles south-east of Glasgow. It consists of one long wide street and of several narrow streets or lanes branching from it at right angles. In ancient times it was a place of considerable importance, carried on a large traffic on the river, and embraced

Glasgow within its municipal boundaries. Its trade is now mainly dependent upon that of Glasgow, and its inhabitants are employed in weaving muslins for Glasgow manufacturers, and in the mills, print, chemical, and dye-works, and collieries of the burgh and vicinity. Pop. (1871) 9543. In parliamentary representation, it is one of the Kilmarnock district of burghs.

RUTHIN, a municipal and parliamentary borough of North Wales, in the county of Denbigh, eight miles south-east of the town of that name, stands on the summit and slope of a hill on the right bank of the Clwyd. The site of the ancient castle, said to have been built in the reign of Edward I., is occupied by a fine modern castellated edifice in Gothic. Pop. (1871) 3298.

RUTHVEN, RAID OF, a conspiracy of note in Scottish history, contrived and executed in 1582 by William, first Earl of Gowrie, father of the principal actor in the Gowrie Conspiracy (q. v.), in conjunction with Lord Lindsay of the Byres, the Earl of Mar, and the Master of Glamis. The object of the conspirators was to obtain the control of the state by seizing the person of James VI., then a boy of 16, and under the guardianship of the Duke of Lennox and Earl of Arran. The king being by invitation at Gowrie's seat of Ruthven Castle, the conspirators assembled 1000 of their vassals, surrounded the castle, and obtained complete possession of James. Arran was thrown into prison, and Lennox retired to France, where he died broken-hearted. The Presbyterian clergy warmly espoused the cause of the Ruthven lords, who received the thanks of the General Assembly, and full indemnity from a Convention of Estates. Nearly a year elapsed before the king regained his freedom. His feigned acquiescence in his position led the confederates so to relax their vigilance that he was enabled to throw himself into the castle of St Andrews, whose keeper was in his confidence, and thus to become his own master. Gowrie and the other lords made their submission, and were pardoned; but soon afterwards a royal proclamation characterised their enterprise as treason. Gowrie was commanded to leave Scotland; but while waiting for a vessel at Dundee, he was drawn into a conspiracy to surprise the castle of Stirling, for which he was tried and executed.

RUTILE, a mineral, which is essentially *Oxide of Titanium* or *Titanic Acid*, although generally containing a little peroxide of iron. It is of a brown, red, or yellow colour; and is found massive, disseminated, in thin laminae, and in four-sided or six-sided prisms, which are sometimes needle-like, and permeate rock-crystal. It is found also in granite, syenite, gneiss, mica-slate, limestone, chlorite-slate, &c., and its geographic distribution is very wide. It is used to give a yellow colour to porcelain.

RUTLANDSHIRE, an inland county of England, much the smallest in England and Wales, is bounded on the N.E. by Lincoln, on the S.E. by Northampton, and on the W. by Leicester. Area, 94,889 acres; pop. (1871) 22,073. The river Wash, flowing east through the middle of the county, divides it into two portions, of which the northern is a somewhat elevated table-land, while the southern consists of a number of valleys running east and west, and separated by low hills. The principal streams are the Welland, forming the boundary on the south-east, and its affluents the Wash and Chater. The climate is mild and healthy, the soil is loamy and rich, and there is hardly an acre of waste land in the whole county. R., however, is not a crop producing, but a grazing county. Oxen and sheep

are reared in great numbers. R., which abounds in pleasing scenery, contains many stately mansions, as well as a number of ecclesiastical remains dating from the Norman period. It returns two members to the House of Commons.

RU'VO IN APULIA, a city of Southern Italy, province of Bari, and 22 miles west of the city of that name. Pop. 15,133. It is built upon a rising ground, contains many churches, and two museums of Italo-Grecian vases, and is famous for its potteries. The staple produce is grain, pulse, and dried fruits. R. is the Rubi of Horace.

RUYSDAEL, or **RUÏSDAEL**, JAKOB, was born at Haarlem. The date of his birth is uncertain, some make it 1625, others 1630 or 1635. It is said that there is a picture by him signed and dated 1645, which makes the last date improbable. He died in 1681. It has been stated, that for some years he directed his attention to the study and practice of surgery, but was advised by his friend Nicholas Berghem to devote his time to painting. In his pictures the trees are excellent in form, the foliage touched with sharpness and precision, and the skies are light and floating. His style of composition is entirely original, and characterised by a certain compactness in the arrangement; the Italian painters have generally groups of trees on the sides, and running out of the picture; in his compositions, they are almost always massed within the picture. R. and Hobbins hold about an equal position—namely, that of the best landscape-painter of the Dutch school; but R. was also equally eminent for his sea-pieces. His etchings, seven in number, are much prized by collectors. Jan van Kessel, Jan Renier de Vries were imitators of Ruysdael. His elder brother, Salomo (born circa 1613, died 1676), was also a painter of some note.

RUYTER, MICHAEL ADRIAANSZON VAN, Dutch admiral, was born at Vlissingen in 1607, of poor parents, who sent him to sea as a cabin boy when only eleven years old. He became a war officer, and in 1635 rose to be a captain in the Dutch navy. After serving several years in the Indian seas, he was, in 1645, made rear-admiral. He engaged and sunk a piratic Algerine squadron off Salée in 1647. In 1652, when war broke out between the States and England, then under the Protectorate, he was placed in command of a squadron, and ordered to convoy a large number of merchant-ships. He was met by the English fleet under Sir G. Ayscough off Plymouth, and an engagement took place. Neither of the fleets gained any decisive advantage; but R. succeeded in saving his convoy. In 1653, when a fight of three days took place between the English and Dutch fleets off Portland, R. commanded a division under Van Tromp. The English, under Bligh, finally obtained a great victory, taking and destroying 11 Dutch men-of-war and 30 merchant-ships. The states-general, in 1659, sent him to assist Denmark against Sweden. He defeated the Swedish fleet, and obtained a title of nobility and a pension from the king of Denmark. In 1664, he fell upon the English factories at Cape Verde, and attempted to seize the island of Barbadoes. As other depredations of the Dutch upon English merchants, as well as in the East Indies as on the high seas, were complained of, war was declared against the Dutch. In June 1666, R. and Van Tromp, with 90 ships, engaged the English fleet under Prince Rupert as the Duke of Albemarle. Both sides fought with such obstinacy that the battle lasted four days, and ended without any decisive result. In July, the conflict was renewed, when the English gained a complete victory, destroying above 20 of R.

men-of-war. In 1667, he destroyed the shipping at Sheerness, sailed up the Medway as far as Chatham, burned several English men-of-war, and effected more towards the conclusion of peace at Breda (1667) than any diplomatist. In 1671, he commanded the Dutch fleet, and fought several battles with the combined English and French fleets, but without decisive results. In 1675, he was sent to the Mediterranean. He fought, off the coast of Sicily, a desperate battle with the French fleet, under the celebrated Admiral Duquesne. Victory declared itself on the side of the French; but R. made good his retreat into the harbour of Syracuse. He had his legs shattered in the engagement, and died of his wounds, April 1676. Europe did justice to his bravery; and Louis XIV. said he could not help regretting the loss of a great man, although an enemy. His death was deeply mourned by his countrymen, and a splendid monument was erected to his memory at Amsterdam.

RYAN, LOCH. See WIGTONSHIRE.

RYBINSK, a district town of Great Russia, in the government of Jaroslavl, stands on the right bank of the Volga, 418 miles east-south-east of St Petersburg. It is the great centre of the corn trade on the Volga, and, after Nijni Novgorod, is the chief commercial centre on that river. The trade of R. consists principally in transshipping and forwarding to the capital the goods brought hither by large vessels up the Volga. For this purpose, upwards of 6000 barges are built here every year. The landing-place extends along the river for several miles, and is divided into nine sections, each of which is appropriated to special varieties of goods. The chief articles of trade are corn, flour, tallow, spirits, metals, and timber, and these are forwarded to St Petersburg by three systems of communications, of which the Mariinsky Canal conveys goods to the value of £5,000,000; the Tichvin Canal, goods to the value of £4,000,000; and the Vyshniyolotsk Canal, goods to the value of £2,000,000. There is, besides, the railway. Pop. (1867) 14,600.

RYDE, a flourishing and fashionable watering-place and market-town, on the north coast of the Isle of Wight, Hampshire, occupies the east and north slopes of a hill, six miles south-south-west of Portsmouth, from which it is separated by the headland of Spit Head. It consists of Upper and Lower R.; the former anciently called *Rye*, or *La Riche*, and the latter of quite modern construction. The shores are wooded to the verge of the water, and the appearance of the town, with its streets and houses interspersed with trees, is pleasing and picturesque. The pier, nearly a mile in length, forms an excellent promenade. Yacht and boat-building are carried on to some extent. Steamers cross every hour to Portsmouth in summer, and several times a day in winter. R., the largest town in the island, had, in 1871, 11,260 inhabitants. R. is connected with Ventnor by a railway.

RYE, a seaport, market-town, and parliamentary and municipal borough in the south-east of the county of Sussex, ten miles north-east of Hastings. It is charmingly situated on an eminence bounded east by the Rother, and south and west by the Tillingham, which streams unite here, and, entering the sea two miles below the town, form the old harbour. The appearance of the town is remarkably quaint and old-fashioned. Overlooking the junction of the streams is a small castle built by William de Ypres, in the reign of Stephen, and now used as a jail. The church is a beautiful and interesting structure—the central tower, transepts, a number of circular arches, &c., all being early Norman. In former times the sea flowed close

up to R., washing the rock on which the Ypres tower stands, but it has retired to a distance of two miles. The harbour admits vessels of 200 tons, and has been recently improved. This ancient town receives historical mention as early as 893. It was walled on two sides by Edward III., and contributed nine ships to the fleet with which that monarch invaded France. Brewing, ship-building, and trade in corn, hops, &c., are carried on. R. is one of the Cinque Ports, and sends a member to parliament. Pop. (1871) of municipal b., 3865; of parl. b., 8290.

RYE (*Secdle*), a genus of grasses, allied to Wheat and Barley, and having spikes which generally consist of two-flowered, rarely of three-flowered, spikelets; the florets furnished with terminal awns, only the upper floret stalked. One species (*S. cereale*) is a well-known grain. It has, when in fruit, a roundish-quadrangular spike, with a tough rachis. Its native country, as in the case of the other most important cereals, is somewhat doubtful; but it is said to be found wild in the desert regions near the Caspian Sea, and on the highest mountains of the Crimea. It has long been cultivated as a cereal plant; although the supposed mention of it in Exodus ix. 32 is doubtful, spelt being perhaps intended. It is much cultivated in the north of Europe and in some parts of Asia. Its cultivation does not extend so far north as that of barley; but it grows in regions too cold for wheat, and on soils too poor and sandy for any other grain. Its ripening can also be more confidently reckoned upon in cold regions than that of any other grain. But R. succeeds best, and is most productive, in a climate where wheat still ripens. It delights in sandy soils. The varieties of R. are numerous, although much less so than those of other important cereals. Some are best fitted for sowing in autumn, others for sowing in spring. The former kinds (*Winter R.*) are most extensively cultivated, being generally the most productive. In some places on the continent of Europe, R. is sown at midsummer, mowed for green fodder in autumn, and left to shoot in spring, which it does at the same time with autumn-sown R., producing a good crop of small but very mealy grain. In Britain, R. is not a common grain crop, and is cultivated to a smaller extent than it formerly was; the sandy soils, to which it is best adapted, being improved and fitted for other kinds of corn. It is, however, sometimes sown to be used as a green crop, for feeding sheep and oxen in winter, and is found particularly good for milch cows. It is sometimes also mown for horses and other animals.—Bread made of R. is much used in the north of Europe. It is of a dark colour, more laxative than that made of wheat-flour, and, perhaps, rather less nutritious. R. is much used for fermentation and distillation, particularly for the making of *Hollands*. R. affected with Ergot (*q. v.*) is a very dangerous article of food. The straw of R. is tougher than that of any other corn-plant, and is much valued for straw-plait.—PERENNIAL R. (*S. perenne*) differs from Common R. in having a very hard, red-like culm; ears, 3–5 inches long, flatly compressed, with a brittle rachis, and 50–60 closely imbricated spikelets. It endures for many years, but is not much cultivated, as its grain is slender, and does not yield an easily separable flour.

RYE-GRASS (*Lolium*), a genus of grasses, having a two-rowed, flatly-compressed spike, the spikelets appressed edgewise to the rachis. COMMON R., or PERENNIAL R. (*L. perenne*), the *Ray-grass* of the older English authors, is frequent on waysides, and in meadows and pastures, in Britain and on the continent of Europe. The spikelets are much longer than their solitary external glume, 6–8-flowered;

the florets awnless or nearly so; the culm flattened, from one foot to three feet high; the root producing leafy barren shoots, which add much to the agricultural value of the grass. This grass is highly valued for forage and hay, and is more extensively sown for these uses than any other grass, not only in Britain, but on the continent of Europe and in North America. It grows well even on very poor soils. The *Common Perennial R.* is the kind most generally cultivated. A kind called *Annual R.*—not really an annual plant, although useful only for one year—is sometimes cultivated; but is, in almost every respect, inferior.—*ITALIAN R.* (*L. italicum*, or *L. multiflorum*, or *L. Bouchianum*), a native of the

1, Common Rye-grass; 2, Italian Rye-grass.

south of Europe, is much esteemed as a forage and hay grass. In many soils and situations in Britain it succeeds extremely well, and is remarkable for its verdure and luxuriance in early spring. It is preferred by cattle to the Common Rye-grass. The young leaves are folded up, whilst those of the Common R. are rolled together.—There are many varieties of Rye-grass. It is nowhere so much valued or cultivated as in Britain. It was cultivated in England before the end of the 17th century. Italian R. was introduced into Britain in 1831 by Mr Thomson of Banchory and Messrs Lawson and Son of Edinburgh. R. is generally sown along with some kind of corn, and vegetating for the first year amongst the corn, appears in the second year as the proper crop of the field.

RYEHOUSE PLOT. In 1683, at the same time that a scheme was formed in England among the leading Whigs to raise the nation in arms against Charles II., a subordinate scheme was planned by a few fiercer spirits of the party, including Colonel Rumsey and Lieutenant-colonel Walcot, two military adventurers; Goodenough, under-sheriff of London; Ferguson, an independent minister; and several attorneys, merchants, and tradesmen of London—the object of which was to waylay and

assassinate the king on his return from Newmarket. The deed was to be perpetrated at a farm belonging to Rumboldt, one of the conspirators, called the Ryehouse Farm, whence the plot got its name. The R. P. is supposed to have been kept concealed from Monmouth, Russell, Shaftesbury, and the rest of those who took the lead in the greater conspiracy. It owed its defeat to the circumstance, that the house which the king occupied at Newmarket had fire accidentally, and Charles was thus obliged to leave that place eight days sooner than was expected. Both the greater and lesser conspiracies were discovered before long, and from the connection subsisting between the two, it was difficult altogether to dis sever them. The indignation excited by the R. P. was extended to the whole Whig party; Lord Russell, Algernon Sidney, as Lieutenant-colonel Walcot were brought to the block for treason; John Hampden, grandson of the more noted namesake, was fined £40,000; and scarcely one escaped who had been concerned in either plot.

RYOT (from the Arabic *raaya*, to pasture, to protect, to govern; hence, literally, the governed a subject) is the vernacular term for a Hindu cultivator or peasant.

RYOTWAR (literally, according to or with ryots) is the term applied to the revenue settlement which is made by the government officers in India with each actual cultivator of the soil for a given term—usually a twelvemonth—at a stipulated money-rent, without the intervention of a third party. This mode of assessment prevails chiefly, though not exclusively, in the Madras presidency. See H. H. Wilson, *Glossary of Judicial and Revenue Terms* (Lond. 1855), under RĀRYATWĀR.

RYSBRACH, MICHAEL, a sculptor of considerable talent, born at Antwerp in 1693. He settled in London in 1720, and executed numerous works there, in particular the monuments to Sir Isaac Newton in Westminster Abbey, and to the Duke of Marlborough at Blenheim, a bronze equestrian statue of William III. for the city of Bristol, a colossal statue of George II. for the park at Greenwich Hospital; a Hercules, and busts of many of the eminent poets, wits, and politicians of his time. Scheemakers, also a native of Antwerp, and Roubilliac, a Frenchman, were contemporaries and rivals of his, and shared with him most of the commissions for works of sculpture in England in the period. With Scheemakers was placed as a pupil Nollekens, who became so distinguished for his busts, and as one of the founders of the English school of sculpture. R. died 8th January 1770.

RYSWICK, PEACE OF, a treaty concluded in 1697 at Ryswick, a Dutch village between Delft and the Hague, which was signed by France, England, and Spain on September 20, and by Germany on October 30. It put an end to the sanguinary contest in which England had been engaged with France. It has been often said that the only equivalent then received by England for all the treasure she had transmitted to the continent, and all the blood which had been shed there, was an acknowledgment of William's title by the king of France; but it must not be forgot how much the allies were benefited by the check given to the gigantic power and overweening ambition of France.

S

THE 19th letter in the English and other western alphabets (the 18th in the Latin), belongs to the dental series, and marks the fundamental sound of the hissing or sibilant group, *s*, *ś*, *śh*, *śh*. The Sanscrit has characters for three hissing or *s*-sounds; the Semitic languages had four (see ALPHABET). The Hebrew or Phœnician character, from which the modern *s* is derived, was called *shin*—i. e., tooth, and in its original form probably represented two or three teeth. The same character, with the presence or absence of a diacritic point, marked either *s* or *śh*. In Eng., *s* is used both for the sharp and flat sounds, as *this*, *those* = *those*. The nearness of the *s*-sound to *th* is seen in the Eng. *loves* = *loveth*, and in the phenomenon of lisping—*yeth* = *yes*. This seems to furnish the transition to the so frequent interchange of the High-Ger. *s* for the Low-Ger. *t*, as in Ger. *wasser* = *water*; Ger. *fuss* = *foot*. Comp. Gr. *thalassa* = *thalatta*. The substitution of *r* for *s* is noticed under R. In such cases as *melt*, compared with *smelt*; *pike*, with *spike*; *lick*, with *sleek*; Ger. *niesen*, with Eng. *sneeze*; Eng. *snow*, Goth. *snais*, with Lat. *nix* (gen. *niv-is*); Gr. *mikros*, with *smikros*; short, A.-S. *sceort*, with *curt*—it is difficult to say whether the form with, or that without the *s* is the older. Grimm considers *s* as the remnant of an old prefixed particle (*as*, *is*, *us*), having, perhaps, the force of *ex* in Lat. *exopto*, I wish greatly; or *ur* in Ger. *urklein*, very small. An initial *s* before a vowel in Lat. corresponds to Gr. *h*; comp. Lat. *sub*, *ex*, *sal* (salt), with Gr. *hypo*, *hex*, *hals*. In Greek and Latin, *s* was pronounced feebly at the end of words, and still more so between two vowels. It thus frequently disappeared in these positions, and this was one of the chief sources of the irregularities in the declensions and conjugations, which had originally been formed on a uniform system (see INFLECTIONS). The dropping of *s* is one of the ways in which the forms of modern French words have become so degraded; compare Lat. *magister*, old Fr. *maistre*, modern Fr. *maître*; *presbyter*, *prêtre*, *prêtre*. Even where still written, final *s* in French is mostly silent—e. g., *vos*, *les*.

SAAD-ED-DIN, a Turkish historian, was born in 1536, and died at Constantinople in 1599. His history, entitled the *Taj-al-Tuvarikh* (the Crown of Histories), a work held in high estimation by scholars, gives a general account of the Ottoman empire from its commencement in 1299 till 1520; it has never been printed, but MS. copies of it are found in most of the great libraries of Europe, and an inaccurate translation into Italian was published in 1646—1652. S. also wrote the *Selim-Nameh*, or History of Selim I., which is chiefly a collection of anecdotes regarding that prince.

SAA'LE, a river of Germany, distinguished from other and smaller rivers of the same name as the Saxon or Thuringian S., rises on the western slope

of the Fichtelgebirge (Bavaria), and flowing northward through several minor states, and finally across the Prussian province of Saxony, falls into the Elbe, about 25 miles above Magdeburg, after a course of 200 miles. It is navigable only within the Prussian dominions.

SAA'RBRÜCKEN, a town of Rhenish Prussia, on the Saar, 40 miles south-south-east of Treves. It is the seat of an active industry, of which coal-mining, spinning, and the manufacture of woollen and linen fabrics, and of pottery and tobacco, are among the principal branches. Pop. (1872) 7686. It was at S. that the French and German armies first met in the war of 1870—1871.

SAA'RDAM. See ZAANDAM.

SAAZ, a town of Bohemia, on the Eger, 45 miles west-north-west of Prague. Hops are largely cultivated in the vicinity, and important corn-markets are held. Pop. 8870.

SABADE'LL, a rising manufacturing town of Spain, in Catalonia, 14 miles by railway north-west of Barcelona. It has risen into importance only within recent years, and it is now the Manchester of Catalonia. Woollen and cotton fabrics are the staple manufactures, and of the 100 factories in the town, by far the greater number are engaged in these manufactures. Pop. about 16,000.

SABADILLA, CEBADILLA, or CEVADILLA (*Asagraea officinalis*, formerly *Helonias officinalis*), a Mexican plant of the natural order *Melanthaceae*, the seeds of which are employed in medicine, because of properties analogous to those of White Hellebore (*Veratrum album*). The plant has a bulbous root, and grows in tufts; the leaves are linear and grassy, about four feet long, and not above a quarter of an inch broad; among them rises a round scape (leafless flower-stem), about six feet high, bearing a very dense raceme, a foot and a half long, of small white flowers. The seed-vessels are papery *follicles*, three together; the seeds one, two, or three in each follicle, two or three lines long, winged, and wrinkled. The powdered seeds have been known in medicine since the end of the 16th century. On submitting them to chemical analysis, they are found to consist of fatty matter, two special organic acids, to which the names *Cevadic* and *Veratric* acids have been given; of varieties of resin, yellow colouring matter, gum, and a highly poisonous alkaloid named *Veratria* in combination with gallic acid; and to these constituents, a French chemist, Couerbe, has added a crystalline body named *Sabadilline*.

Notwithstanding its highly poisonous properties, S. is prescribed on many parts of the continent as a vermifuge in cases of tape-worm and ascarides, and it may be administered to an adult in 8 or 10 grain doses, mixed with a little sugar, and a few drops of oil of fennel. In the form of powder, it is sometimes applied to the head to destroy lice, but if the skin be broken, some other remedy should be selected, as absorption to a dangerous extent may

ensue. From its stimulating properties, it is usefully employed in the form of tincture (which, however, is not an official preparation) as an external application in chronic rheumatism and paralysis, and in cases of nervous palpitation.

The active principle of *S.*, the *Veratria*, in doses of $\frac{1}{16}$ th of a grain, gradually increased, and taken thrice a day, has been found very efficacious in acute rheumatism; and applied in the form of ointment, it has been highly recommended in scrofulous diseases of the joints. When prescribed internally, its use should be at once suspended if the patient complain of pain in the throat or stomach, vomiting or diarrhoea. Similar qualities are said to exist in the seeds of *Veratrum Sabadilla*, a native of Mexico and the West Indies, and in some of the species of *Helonias*, natives of the southern parts of North America.

SABÆANS, the supposed descendants of one, two, or three Shebas mentioned in the Bible. Historically, the *S.* appear chiefly as the inhabitants of Arabia Felix or Yemen (to the north of the present Yemen), the principal city of which was called Saba, and the queen of which is said to have visited Solomon, attracted by the fame of his wisdom. Josephus, however (*Ant.* viii. 6, 5), makes her the queen of Ethiopia (Meröe), and the modern Abyssinians claim her as their own. Her name, according to their tradition, was Makeda; and her visit to Jerusalem made her not only a proselyte to the religion of Solomon, but she became one of his wives, and had by him a son, Menilek, who afterwards ruled Ethiopia (q. v.). The Arabs, on the other hand, call her Balkis, the earliest name that occurs of a Himyaritic queen; but there is no more historical value to be attached to this tradition than to the innumerable legends that have clustered round her name in connection with the great king.

Numerous passages in Greek and Roman writers, as well as in the Bible, testify to the vast importance of these dwellers in Yemen as a wealthy, widely-extended, and enterprising people, of fine stature and noble bearing. Their chief greatness lay in their traffic, the principal articles of which consisted of gold and perfumes, spice, incense and precious stones, a very small portion of which, however, was of home production, Yemen being only productive in corn, wine, and the like matters of ordinary consumption. But the fact was, that the *S.* held the key to India, and were the intermediate factors between Egypt and Syria, which again spread the imported wares over Europe; and even when Ptolemy Philadelphus (274 B.C.) had established an Indian emporium in Egypt, the *S.* still remained the sole monopolists of the Indian trade, being the only navigators who braved the perilous voyage. As in many other respects, they also resembled the Phœnicians in this, that, instead of informing other people of their sources and the tracks of their ships, they told them the most preposterous tales about the countries they visited, and the fearful dangers they encountered; and in regard to most things, endeavoured to impress upon the minds of their customers that what they sold them was, if artificial, their own manufacture—if natural products, home growth. Being the principal merchants of those things which the over-refined luxury of late classical times considered as absolute necessities of life, they could not fail to gather enormous riches; e. g., in the 3d c. of the Roman empire, every pound of silk—a material enormous quantities of which were used—that came from Arabia was paid by a pound of silver, at times even of gold. As a natural consequence, the *S.* became luxurious, effeminate, and idle. The pictures of them drawn by the classic writers are

doubtless exaggerated. The country itself, according to the reports of Greek writers, grew spice-wood to such an extent that its odour caused apoplexy among the inhabitants, and bad smells had to be used to counteract these over-potent influences. The meanest utensils in the houses of these merchant princes were—if we were to credit those writers—wrought in the most cunning fashion, and were of gold and silver; their vases were incrustated with gems, their firewood was cinnamon. Their colonies must, in the nature of things, have extended over immense tracts of Asia—the Ethiopian *S.* probably being one of the first foreign settlements; yet nothing beyond the vaguest conjectures can be given about them. Regarding their government, Dio Cassius informs us that they had a king, who never was allowed to leave his palace, and that the first child born, after the accession of a new king, into one of a certain number of noble families, was considered the heir-presumptive for the time being. Commerce had also done for them what it did for the Phœnicians—it civilised them, and caused them to carry civilisation further; and they stand out among the ancient semi-barbarous Arabs as a community of high culture. Respecting their religion, see ZABISM. Their language is supposed to have been a Semitic (Arabic) dialect, which, however, is almost entirely lost to us now. Some tablets of Himyaritic inscriptions have been found, but the readings are not quite satisfactorily fixed as yet. See SEMITIC LANGUAGES, ARABIA.

SA'B'BATH (Heb. *Shabbath*, *Sabbathon*, &c., fr. *shabath*, to rest; not from *shub*, to return, or *shab*, seven) designates the seventh day of the week, aside, in the Old Testament, as a period of cessation from work. Without entering into the question of its origin, i. e., whether it be an institution of pre-Mosaic times—either of 'paradise' or of 'Edenism'—or whether it be purely Mosaic, we did merely state that, according to our only available source, the Pentateuch, the division of the week (q. v.) into seven days appears at a very early period, but the celebration of the seventh day as a day consecrated to Jehovah, is first mentioned after the Exodus from Egypt, and seems to have preceded the Sinaitic legislation, which merely confirms and invests it with the highest authority. On the occasion of the manna (Ex. xvi. 23), the *Sabbath* solemnity seem presupposed, and the 'Remembrance of the Sabbath-day' of the Decalogue, further seems to indicate its previous institution. There is no trace of its celebration in the patriarchal times, although the Semitic traditions of the creation, and of the completion of it on that day, had undoubtedly marked it early as a special day of sanctity among the Abrahamites. The significance that was added to it after the Exodus, i. e., that of being a remembrance of the freedom from bondage, seems to appear likely enough that its first legal promulgation dates, as a Talmudical tradition has it, from Marah, where Moses 'set them laws and statutes' (Ex. xv. 25). While it thus on the one hand is a sort of general human memento of the Creator and the Creator of all things, as it is characterised in the first redaction of the commandments of Exodus, it became also, on the other hand, a national day of record of the bondage and the liberation; it, a notion prominently brought forward in the second recension of the Decalogue (q. v.) (Deut. 15), and the 'rest' that was inculcated for every body—kindred, strangers, slaves, even animals—received a double meaning. It is in the same sense also denominated a sign between Jehovah and the generations of Israel (Ex. xxxi. 13): a badge of nationality, a token of the covenant between Jehovah and Israel for ever (Ex. xxxi. 13).

d. Ezek. xx. 12, Neh. ix. 13, &c.). It is constantly mentioned together with institutions of the same peculiar nature; such as reverencing the sanctuary (Lev. xix. 30), celebrating the feasts of a national character (Hos. ii. 11), keeping the ordinances (Ezek. xlv. 17), &c. And in like manner it was made one of the first obligations for proselytes, as one by which they were 'taking hold of the covenant' (Is. lvi. 6). A few special cases only are furnished by the Pentateuch in explanation of the word 'work' used in the prohibition—lighting a fire, gathering sticks, going out of the camp for the purpose of gathering manna. The violation of this law of rest was, as a crime of high treason against Jehovah, punishable with death; yet cessation from labour was only the negative part of the celebration of the day, which is called, like the other festivals, a 'holy convocation.' It is difficult to decide now what precise meaning is to be attached to these words, as referring to the early periods of Israelitish history, particularly before the institution of the prophets or sacred orators had been fully developed. It may be conjectured that the convocation was a kind of general religious assembly, in which readings and some kind of exposition of the law formed the principal features; and there is indeed a tradition to that effect recorded in the Talmud. Some, however, suppose that it was a festive meeting in honour of Jehovah, and refer to Neh. viii. 1-18 for proof that such a celebration was consistent with Jewish notions of keeping days holy to the Lord. As a further celebration of the day, a special burnt-offering, consisting of two lambs of the first year, with the corresponding meat and drink-offering, besides the ordinary daily sacrifice, was instituted, and the shew-bread was renewed in the sanctuary.

Thus far the Pentateuch on the Sabbath. Turning to the later biblical books of the times before the Exile, we find casual references to it as a day of rest and joy, exalted over the other days of the week, and on which agricultural labours and all things connected with them, such as carrying loads, selling and buying, &c., ceased. No deeper signification seems to have been attached to it yet. Although with Jeremiah and Ezekiel, single it out especially in common with monotheism and the laws of morality, yet they both rest satisfied with the inculcation of its outward observance, which seems occasionally to have fallen into entire disuse. With the return from the Exile, however, a new phase was inaugurated. It is well known how energetically Nehemiah carried out his reformation, or rather the restoration of the primitive laws, as in other respects with regard to the S.; how he 'testified' against those who were treading wine-presses on the S., and ringing in sheaves, and lading asses, &c., and, further, against those 'men of Tyre' who brought all manner of ware, and sold on the Sabbath unto the children of Judah and in Jerusalem.' It is by relaxing the S., he urges, that their fathers have caused all the evil and wrath that befell the nation and the city. He had the gates shut from Friday evening to Saturday night, and drove away those merchants who still kept lodging outside, by threats of 'laying hands on them.'

What Nehemiah had reinstituted, seems to have been most rigorously upheld, and in many cases made more binding even than he ever intended it; at all events, than the originally promulgated form of his words would seem to imply at first sight. With respect to the S. in particular, we find it more than 100 years afterwards kept with such severity that the people would not even stir in defence of the city of Jerusalem, stormed by the soldiers of Ptolemy I. on that day. Later still,

those who had fled into caves to escape the persecution of Antiochus Epiphanes, allowed themselves to be butchered wholesale, nay, burned alive, without any attempt at flight or resistance; 'because they made a conscience to help themselves for the honour of the most sacred day' (2 Macc. vi. 11). It was only in consequence of these horrible catastrophes, and in consideration of the probability of the enemy's always choosing the hallowed day for his attacks, and thus gradually rooting out the nation, that fighting in self-defence was allowed; although it appears the enemy was not to be disturbed in his siege works. Yet this relaxation in favour of the defensive appears again to have been abrogated through the influence of the fanatical Chassidaic party. Both Pompey and Herod, it would seem, took advantage of the S. for the preparation of the storm on Jerusalem, relying—and successfully—on the strict observance of that day by their antagonists. The incessant tribulations, however, that followed almost without interruption till the final destruction of the Jewish empire, together with the influence of new schools and views, wrought an immense change. Shammai himself, the austere interpreter of the law, and the so-called antagonist of the milder Hillel, pronounced not only the defensive but the offensive legal and righteous (Sabb. xix. a): as, indeed, in his days, human life was placed, under all circumstances whatsoever, higher than any divine or human precept about the Sabbath. 'The Law,' it is said with regard to the S., was given, according to the Scriptures, like other laws, 'that man should live by them,' 'not that he should die through them' (Tos. Shab. xvi. 5). That Joshua had never stopped in his sieges on the S., was not considered so weighty an argument as the dire and imminent necessity that forced itself upon the military and spiritual leaders of the people, of preserving at all hazards a remnant at least of the fast perishing nation.

It was probably after the Exile that the first attempts at legally fixing, or rather 'fencing about' the divine ordinance in a minute and rigorous manner, were made. As we have seen before, no special definition of the 'work' prohibited—save in a few instances—is to be found in the Old Testament. Whether it was the 'men of the great synagogue,' or the later schools, that promulgated the special precepts and prohibitions—part of which were traced to the legislation on Sinai itself (Oral Law)—is difficult to decide. The Mishna only enumerates thirty-nine principal ('father-') works, each of which, again, carries a certain number of minor ('begotten') works with it, which are strictly forbidden on the Sabbath. A certain portion of these inhibitions and prohibitions refers to work connected with agriculture and the chase; another to domestic labours generally performed by women (such as spinning, sewing, &c.); another again to trades (of builders, mechanics, labourers, &c.) and the like. One of the most harassing of precepts, and one which had at last to be amended by a number of new enactments, was the prohibition of moving things from one place into another (from public to private localities, and *vice versa*). The minor prohibitions referred chiefly to things which might easily 'lead' to the violation of the S., such as riding on horseback, climbing trees, &c. The 'Sabbath-day's journey,' or prohibition, based on Ex. xvi. 29, of walking more than the supposed utmost space between the ark and the extreme end of the camp, seems to belong, in the Mishnaic form at least, to the Roman times; the *mil* to which it was limited, and which contains the requisite 2000 yards, being a Roman measure.

However it is to be reconciled with the well-known narrative of Christ's healing on the S.-day, contained in the New Testament, there is absolutely no doubt about the fact that, according to the so-called Pharisaical code—i. e., the Oral Law, the highest and absolute authority of Judaism—the safety of life and limb utterly over-rides not only the S., but even the day of Atonement itself. It is only certain smaller alleviations of momentary pain, such as could not by any chance place the patient in the slightest danger, about which we find some kind of casuistical discussions. Practically—that is, according to the final enactments (see Maimonides *Yad Chasaka*)—it is not only the regard to life, but to the health and well-being of the patient, that sets all Sabbatical prohibitions at naught. The law of 'rest,' according to the Talmud, applies no more to the case of the sick or those anyhow endangered, than it did with regard to the temple, and all the 'work' therein, which, indeed, was much heavier on S. and feast days than at other times. Another difficulty is found in the words in which Christ refers to the beast that is to be taken out of a pit on a S.; the Jewish law ordaining, in reality, that it should be aided in its own efforts, if it endeavoured to get out by itself; if it did not succeed, it should be left there, food being let down to it, until the end of the S. (Luke xiv.; Matt. xii. 11; Sabb. 123 b). Could it be that the common people (the Hediots or Idiots—i. e., the untutored in the law) were ignorant of the real scope and purport of the 'Pharisaical' code, and that the argument was directed against their crude notions, as directly opposed to the law as established?—But on this we must not enlarge here. It is also impossible to enter into any of the various ancient and modern ways of looking at the S. in an allegorical and symbolical light, e. g., its being connected by Philo and his school with the planets, the spheres, the number seven and the like mystical notions. Nor can we follow here those speculations which make out a close parallel between the divine work and rest and human work and rest; and show how well-rounded and entire time itself appears when shaped into a week after the model of the six days of creation, and how man's life is, through it, conformed to that of his Creator.

There can be no doubt about its meaning in the Old Testament. It is intended as a principal testimony of faith in the Creator of the universe. Hence its supreme importance. Though the threatened punishments for S.-breakers never seem to have been carried out to the full during the times of the established commonwealth, in the scheme of Judaism it was placed on a par with the entire body of the Law. He who transgresses the S. is considered legally, according to Maimonides, as one who has set the whole law at defiance, and is to be looked upon in every respect as like a 'worshipper of stars'—i. e., a heathen.

Regarding the development of the positive side of the Sabbatical observance, we have to mention first, that in conformity with the precept making it a day of 'holy assembly,' the synagogue (irrespective of the temple-service, its special sacrifices, prayers, and psalms for the day), assembled the faithful on that day within its precincts in every town and hamlet in and out of Palestine before and after the final Exile. A certain portion of the Pentateuch, to which afterwards was added a prophetic pericope, the Haftarah, was read, translated into the vernacular, and expounded homiletically. Special prayers and psalms, in addition to the ordinary slightly-modified service, with special reference to the sanctity of the S., were said and sung, and the rest of the day was devoted to pious meditation.

study in the law, and to serenity and joyfulness. Respecting this last point, it must be borne in mind that the day is distinctly called a *day of joy and delight* (e. g., cf. Ps. xcii., Is. lviii. 13, Hos. ii. 11, 13, &c.—the words in Is. translated in the authoritative version by 'doing thy pleasure,' in reality mean 'doing thy work'; the Hebrew word in this passage exactly corresponding to our 'affairs,' 'business'). A variety of minor regulations referring to bodily indulgences on that day, abundantly proved—its further proof were needed—its recognised character as a 'feast-day' in the natural and general sense of the term, in Judaism. It was to be honoured by the wearing of finer garments, by three special meals of the best cheer the house could afford (fish, meat, &c.); and it was considered a particularly meritorious thing on the part of the master of the house to busy himself personally as much as possible with the furnishing of the viands, nay, the fetching of the very wood for the cooking, as to do as much honour to the 'bride Sabbath' as in him lay. Wine, if the means of the individual would anyhow allow it, was to crown the repast, special blessings being duly pronounced over it with reference to the holy day, both at its coming in and at its going out. From the circle of the family, the custom of welcoming, as it were, the S., and taking leave of it, with the cup of blessing, with light, and with spice, found its way at an early period into the synagogue, on account of those strangers who, having to stop on their journey during the twenty-four hours, were often lodged and fed near the synagogue, and on whose behalf the blessing had to be pronounced generally. Fasting, mourning, mortification of all and every kind, even special supplicatory prayers, are strictly prohibited; but on the contrary, the number of 'a hundred benedictions,' said at all varieties of enjoyments of the world, are to be completed on the S., were it even by eating different kinds of fruit, smelling different spices. Those who study hard during the week are to rest somewhat on that day, while those bent on business all week may indulge more freely in their recreation, even school children are to be released from their lessons on that day. Nay, the Friday itself participated in a manner in the solemnity of the S., and its very name was sunk in 'Eve of Sabbath.' At an early hour in the afternoon, trumpets were blown from the steps of the temple in Jerusalem, and certain shops, the stopping of whose business required some time, began to close. Again the trumpets resounded at certain intervals, and other trades ceased, as, indeed, nothing was even to be begun on Friday which could not be finished or stopped at the end of that day. The day also was restricted to a certain extent of labour, and judgment over life and death was suspended. At last, when the sun descended from the horizon—irrespective of the place, whence a difference arose between the beginning of the S. among the dwellers in the land, or on elevations—the hallowed period commenced and lasted until three stars were visible in the following evening.

The original formulas, much enlarged in later times, as far as they are to be traced, were an introductory benediction, as well as the *Kaddish* prayer, both of which we subjoin, showing the character and scope of the day in Judaism, and which they may stand instead of any further additions of our own.

1. (*Kiddush*.) 'Blessed art Thou, O Lord, our King of the Universe, who hath sanctified us by His Laws, and hath made us partakers of Thy Grace, and hath, in His Love and in His Mercy, given us the Sabbath, as a remembrance of Thy

creation, as the first day of Holy Convocations, and a memory of the redemption from Egypt; for Thou hast chosen us and sanctified us from all peoples, and hast given unto us Thy holy Sabbath in Love and in Grace. Blessed art Thou, O Lord, who sanctifieth the Sabbath.'

2 (Habdalah.) 'Blessed art Thou, O Lord, our God, King of the Universe, who divideth between Holy and Unholy, between Light and Darkness, between Israel and the peoples, between the abbat and the six days of creation. Blessed art Thou, O Lord, who divideth between Holy and Unholy.'

The same character of cheerfulness, of happy rest from the toil and turmoil of the world's business; of quiet and peaceful 'return into one's self'; of joyous communion with friends and kindred over good cheer—in short, of mental and bodily relaxation and recreation that strengthens, braces, pacifies, and maketh the heart glad, while the sublime ideas which it symbolises are recalled to the memory at every step and turn—seems to have prevailed at all times, down to our own, among the Jews. Whatever difference there may be in the peculiar notions respecting the S. among some of the recent sects among them, e. g., the Karaites, the Chassidim, &c. (see JEWISH SECTS), they chiefly refer to the liturgy (with the one vital exception, that the Karaites entirely abstain from the use of light and candles during the whole of the twenty-four hours), and some minor points, upon which we cannot dwell here. It is also unnecessary here to go into the special 'superior' or 'mourning' Sabbaths during a year, i. e., those that precede or follow certain festivals or days of humiliation, or such as formerly inaugurated new academical semesters (Kallah), and the like. Suffice it to reiterate that in every class, every age, and every variety of Jews, from first to last, the S. has been absolutely a day of joy and happiness, nay, of dancing, of singing, of eating and drinking, and of luxury. The 'luxus Sabbatarius' of Sidonius Apollinarius has indeed been a reproach to them, as was their supposed over-indulgence in idleness. The thinking minds were, according to Plato and others, more than ever busy on that day with those sacred mysteries of God's revelation to man and his miraculous workings on behalf of the chosen nation; others' hearts were lifted up by psalms, by readings, by earnest exhortations, and by pleasing and instructive homiletics. A dark, satirical, self-torturing spirit is as foreign to the Jewish S. (which is prolonged as far as possible) as it is foreign to the Mosaic and post-Mosaic legislation, its written and oral laws in general.

The benefits of the institution itself for the individual are, after what we have said of its practice, self-evident to require further comment. How connected, on the one hand, the human being with the divine Creator, and, on the other, with his fellow-creatures, brother and stranger, children and slaves, nay, the very beast of burden, the ox and the ass—how, ever recurring, it inculcated with irresistible force pious reverence, fear, and love of God, the sole master of all things—man's time and property included—good-will to all things created; and the absolute equality of all men—need not be said here. Proudhon has recently treated on it from the national-economy point of view, and he has come to the conclusion, that the proportion of the seven days of work to the one of judicious rest, is one manifest wisdom, and of great blessing to man.

It is necessary here to say a few words with reference to the notion that the S., i. e., the celebration of the seventh day as a day of rest, is an institution common to all or most of the civilised nations

of antiquity (Assyrians, Arabs, Egyptians, Greeks, Romans), from whom Moses has also been charged with having borrowed it. There is no more truth in these statements than there is in the often repeated assertion of an ancient S. among the aboriginal savages. The dicta of Philo and Josephus, to the effect that there was no city, either Hellenic or barbarian, and not a single people, to which the custom of the S. had not penetrated, have absurdly enough been taken by some as a proof that the Jews borrowed the custom. If the number seven [six and one] is one to which a peculiar significance attached at a very early period, in connection with the calendar (compare the seven worlds, the seven continents, the seven seas, &c., of the Indian cosmogony), and if the weekly cycle of seven days which goes back to the ante-Mosaic period (see Gen. xxix. 27, seq.; vii. 4, 10; viii. 10, 12, &c.), is, probably, the common property of the Semitic races; yet there is a mighty difference between counting time by seven (the ancient Egyptians had, in fact, a ten days' previous to a seven days' cycle), and making the seventh day a 'day of rest and holy convocation,' with reference to the national life of Israel. There is no special sanctity found attached to the day either with the Egyptians or with the pre-Mohammedan Arabs, who sacrificed on that day in black garments, in a hexagonal black temple, an old bull to Saturn: exactly as they sacrificed a boy on another day of the week, sacred to the planet Jupiter. As for the Greeks, the only authenticated passage we find with reference to the subject, is Hesiod's (*Op. et D.* 770, &c.) reference to the seventh day of the month, sacred to Apollo as other days were sacred to other gods. Other verses quoted by Clemens Alexandrinus and Eusebius, as from Homer and Hesiod, are proved to be spurious Judæo-Hellenic fabrications. The Roman calendar knows absolutely nothing of a hallowed seventh day.

Thus much on the S. under the 'Old Dispensation.' We have still to consider it in relation to the Christian Church, and to trace the progress of opinion and practice in regard to the observance of the first day of the week, which in this country is frequently styled the Sabbath, or, more definitely, the Christian Sabbath.

It is hardly necessary to observe, that all the discourses of Jesus were addressed to Jewish hearers, subject, like himself, to the Mosaic law. That he is nowhere recorded to have enjoined the observance of the S. has by some been thought significant, but seems to have been natural enough in a case where those he addressed, so far from neglecting the duty, were superstitiously scrupulous in its performance. What his hearers needed and received was the lesson, that, the S. having been intended for human benefit, the duty of observing it ought to give way before the higher duty of effecting that purpose, when the two were in conflict; and that trivial acts demanding no exertion were not to be confounded with that real and exhausting labour which was the thing truly forbidden. (Matt. xii. 1–14; Mark ii. 23–28; iii. 1–6; Luke vi. 6–11: cf. Hosea vi. 6; Psal. l. 8–14; li. 16, 17; Ia. i. 10–17; Jer. vi. 19, 20; vii. 21–23; 1 Sam. xxi. 6). Some have thought that by making clay on a S. to anoint the eyes of a blind man, and by ordering an invalid, when cured, to carry home his bed on another S., he designed to intimate, if not the present abolition of the S., at least its approaching end. But others look upon the former of these acts as much too trivial to be confounded with 'servile work,' and the latter as an exceptional case within the scope of the principle above stated. On no occasion does he appear to

have sanctioned the performance of real work on the seventh day, unless it was demanded by some higher duty than that of bodily rest.

For several years after the death of Jesus, the Church included none but Jews, and by these the S. and other Mosaic rites continued to be observed as before. It was not till Peter's visit to the centurion Cornelius (41 A. D.) that the Gospel began to be preached to the Gentiles; and when the apostles and elders met at Jerusalem to consider what was to be done with the Gentile brethren, it was decided that no Mosaic burden should be laid upon them beyond abstinence from certain practices, of which working on the S. is not one (Acts xv. 23—29). Nevertheless, the Judaizing party continued in various places to demand more or less conformity to the law on the part of the Gentile converts. This party was strenuously withstood by Paul (q. v.), in whose Epistles the dispute is a subject that frequently recurs. From his letters to the churches of Rome, Galatia, and Colosse, which contained both Jews and Gentiles, we learn that, while the Jews wished the Gentiles to observe the Sabbaths prescribed in the law, the Gentiles were prone to treat the observance of Jewish ceremonies with contempt. Upon both parties the apostle enjoins mutual forbearance and respect; forbidding the Jew who esteemed one day above another to disturb the Gentile who esteemed every day alike, and ordering the Gentile to refrain from contemning the observances conscientiously performed by his weaker brother the Jew (Rom. xiv.; Col. ii. 11—17). That he never taught the Jewish Christians to abandon the observance of the law, but, on the contrary, continued to the end to observe it himself—as appears from Acts xxv. 8; xxviii. 17; Philip. iii. 6—are facts of which different explanations have been given by theologians; some thinking that the law continued binding on the Jews, whether Christians or not, so long as the Temple stood; while most are of opinion that conformity to the rooted notions and habits of that people was tolerated for a time, in order that the diffusion of the Gospel might not be impeded amongst them. In the Eastern churches, where the proportion of Jews was greater than in the West, the S. continued to be observed till the 5th c., when we lose sight of the Ebionites (q. v.), a sect of Judaizers such as Paul withstood—and of the more moderate Ebionitic Nazarenes, who, though they conceived it to be their *own* duty to circumcise, keep the S., &c., had no desire to impose the peculiarities of Judaism on the Gentile Christians. Down to the present time, however, S.-keeping and various other Jewish rites continue to be practised along with Christian observances by the Christians of Abyssinia, whose ancestors, it is probable, derived them either (as a tradition among them indicates) from missionaries of the Alexandrian Church, of which many members were Jews, or from expatriated Hebrews who settled in Abyssinia at some much earlier date. In other countries also, many of the Gentile Christians seem to have anciently observed the S., if not by resting the whole day from work, at least by attending on it the religious meetings of their sabbatizing Jewish brethren.

Hitherto we have spoken of the observance of *Saturday*, the day of rest prescribed to the Jews, and to which exclusively the name of the S.-day was anciently applied, and still continues to be given by every nation but our own and its offshoots. At what date the Sunday, or first day of the week, began to be generally used by Christians as a stated time for religious meetings, we have no definite information either in the New Testament or in the writings of the Fathers of the Church

(q. v.). By none of the Fathers before the 4th c. is it identified with the S., nor is the duty of observing it grounded by them either on the fourth commandment, or on the precept or example of Jesus or his apostles, or on an ante-Mosaic S.-law promulgated to mankind at the creation and continuing in force after the coming of Christ. To the reality of such a law—which many modern Christians have deduced from Gen. ii. 2, 3; iv. 3; vii. 4, 10; viii. 4, 10—12; xxix. 27; 1. 10; Ex. xvi. 4—30; and which some (as Bishop Horsley, *Serm.* 22) regard as an indispensable basis for a Christian S.—it has been objected that the attention of the Gentile converts, who must be supposed to have been ignorant of the law in question, is nowhere found in Scripture to have been directed to it by Paul; that his declarations of their freedom from the observance of days are so general as to apply to every law on that subject, whensoever enacted; that consequently he must either have been unacquainted with a primeval law, or (if not) have regarded it as obsolete under the new dispensation; and lastly, that the Fathers, had they known such a law, would have mentioned it in their writings, instead of vindicating (as Justin, for instance, does in his *Dialogue with Trypho the Jew*) the neglect of S.-keeping by Gentile Christians, on the ground that the S. began with Moses and was not observed by the Patriarchs. By none of the Fathers is any S.-law whatever represented as being in force among the Gentiles.

On what grounds, then, did the Christians observe the first day of the week as a time for religious assemblies?—and how and when did the custom so distinguishing it begin? To these questions very different answers have been given. According to some theologians, apostolic precept or example is the only conceivable origin of a custom apparently so general as well as early; and of a custom at least, they find evidence in John xx. 19, 26; Acts ii. 1; xx. 6, 7; 1 Cor. xvi. 1, 2; and Rev. 1. 10. But others, doubting or denying the conclusiveness of this scriptural proof, conceive that an adequate explanation may be found in the circumstances of the primitive Church. That the desire which naturally actuates the members of every new and popular religious sect to meet frequently for words of instruction, and mutual encouragement, might not soon lead to the fixing of stated days for that purpose, may be assumed as self-evident; that a weekly day should be chosen, would be a natural result of the Jewish habits of the earliest Christians; and that the day on which their Lord had risen victorious from the grave should be thought fit for this weekly festival, is precisely what was to be expected in their circumstances. But the resurrection of Jesus is by no means the only reason assigned by the Fathers for the honour which they paid to the Sunday. By Justin (see *Justin Martyr*), whose *Apology for the Christians to Antoninus Pius* is ss. 87—89, written between 138 and 150 A. D., the earliest undoubted mention of Sunday meetings—the works of the Fathers occurs, several reasons for holding them *then* are assigned—the first being that on this day of the week the world and man were created; and the second being the resurrection of Christ. 'We all of us,' says he, 'assemble together on Sunday, because it is the first day on which God changed darkness and matter, and made the world. On the same day, also, Jesus Christ, our Saviour rose from the dead; for he was crucified on the day before that of Saturn, and on the day after that of Saturn, which is that of the Sun.' He appeared to his apostles and disciples, and taught them what we now submit to your consideration. To these reasons, Origen (*Seventh Hom. on Exod.*) adds the fact that manna was first given to the

Israelites on a Sunday; while subsequent writers adduce various other events, either recorded, or by them imagined, to have occurred on that day. In arguing with Trypho, Justin opposes S.-keeping by Christians, on grounds which would have been retorted by the Jew as condemning equally the observance of a first-day S., had the Sunday at that time been regarded as the S.: from which fact, and the circumstance that in his *Apology* already spoken of, where he professes to give the Emperor Antoninus a full account of the observance of the day, no mention is made of rest from labour as a part of that observance, the inference has been drawn, that, except during the time of divine service, the Christians in this Father's age thought it lawful to follow, and actually did follow, their worldly pursuits on the Sunday. It is true that by Tertullian, who wrote in the latter half of the 2d c., the Christians are described as putting off even their business on the Lord's day, lest they might give place to the devil' (*De rat. c. 23*); an indication, in Neander's opinion (*Church Hist. i. 409*, Bohn's ed.), that now the Jewish law of the S. had begun to be applied to the Lord's day. But the soundness of this interpretation has been questioned—Dr Hessey, for instance (*Bampton Lectures*, 1860, p. 63), stating that he can find in it 'nothing Sabbatarian—nothing, in fact, more than I should have expected, considering that the Church had now become somewhat settled—that, rather than that the duties peculiar to the Lord's day should be neglected, worldly business was put off to another day.' But whatever may have been the opinion and practice of these early Christians in regard to cessation from labour on the Sunday, unquestionably the first law, whether ecclesiastical or civil, by which the sabbatical observance of that day is known to have been enjoined, is the edict of Constantine, 321 A.D., of which the following is a translation: 'Let all judges, inhabitants of the cities, and artificers, rest on the venerable Sunday. But in the country, husbandmen may freely and lawfully apply to the business of agriculture; since it often happens that sowing of corn and planting of vines cannot be advantageously performed on any other day; but, by neglecting the opportunity, they should lose the benefits which the divine bounty bestows on them' (*Cod. iii. 12, 3*). Before this time, such of the Christian writers as had endeavoured, by a mystical mode of interpretation, to turn the Mosaic ceremonies to account as sources of moral and religious instruction, had, probably in imitation of Philo (*Works*, iii. 265, Bohn's ed.), spiritualised the law of the S. to the effect of representing it as a ritual prohibition to the Christian of evil works during all the days of his life, and a prefiguration of the spiritual repose and enjoyment which his portion both in this world and in the next. But in addition to this significance, there now began to be discovered in the Old Testament, foreshadowings of the new Sunday-S.; and Eusebius (q. v.), bishop of Caesarea, the friend and biographer of Constantine, was able to descry in Ps. xlii. 5, and lix. prophetic allusions to the morning assemblies of Christians on Sundays for worship, and in Psal. xlii. a prefiguration of the weekly celebration of the Lord's Supper on that day. Applying Ps. xcii. to the first day of the week, the same writer says that the Word, by the New Covenant, translated and offered the feast of the Sabbath to the morning light, and gave us the symbol of true rest—the saving Lord's Day, the first of the light.

From other passages in Eusebius and subsequent writers, it is plain that they meant, not that this transference had been formally ordained by

Christ (of which there is no trace in Scripture), but that by rising from the tomb on the first day of the week he had made that day more illustrious than the S., and more worthy to be celebrated by the holding of Christian assemblies for worship than the S. was to be similarly honoured by the Jews. About the end of the 4th c., Chrysostom is found similarly expounding Gen. ii. 3, which, in his opinion, shews that already from the beginning God offered us instruction typically, teaching us to dedicate and separate the one day in the circle of the week wholly to employment in things spiritual—thus (as his translator observes) making the S. a type of the Lord's Day, and rest from bodily, of rest in spiritual work. (*Library of the Fathers*, ix. 209.)

It was a natural result of Constantine's law, backed by such interpretations of the Old Testament as these, that, in the words of Dr Hessey, 'a new era in the history of the Lord's Day now commenced; tendencies towards Sabbatarianism, or confusion of the Christian with the Jewish institution, beginning to manifest themselves. These, however, were slight, until the end of the 5th century, and are traceable chiefly to and in the civil legislation of the period. Afterwards they developed themselves more decidedly; Sabbatarianism became at length systematised, in one of its phases, in the ante-Reformation Church both in England and on the Continent by the later Schoolmen, probably in their desire to lay down exact rules for consciences, and under a fancied necessity of urging the precedent of Jewish enactments in support of Christian holy-days' (p. 20). But it was not till the year 538 that abstinence from agricultural labour on Sunday was recommended, rather than enjoined, by an ecclesiastical authority (the third council of Orleans), and this expressly 'that the people might have more leisure to go to church, and say their prayers;' nor was it till about the end of the 9th c., that the Emperor Leo, 'the Philosopher,' repealed the exemption which it enjoyed under the edict of Constantine (*Leo. Const. 54*). And now, the Lord's Day being thoroughly established by law as a S., the fourth commandment would more than ever be employed by the clergy as a means of persuading to its observance. The entire Decalogue, indeed, had long been used by them as a convenient summary of human duty; and by the later Schoolmen it came to be represented as, to a certain extent,—i. e., so far as it coincided with the law of nature—actually obligatory on Christians. This theory of its binding force, and the notion of the holiness of days, were vigorously opposed by Luther and the other Reformers, who denounced also the excessive multiplication of festivals, and proclaimed that the pardon of sin was not to be secured by their observance, or otherwise than by faith in Christ. (See Luther's *Larger Catechism*; the *Augsburg Confession*, 1530, c. vii.; Calvin's *Institutes*, b. ii. ch. viii. ss. 28—34; and his other writings on the subject, collected by R. Cox in *The Whole Doctrine of Calvin about the Sabbath and the Lord's Day*, Edin. 1860). But, while condemning everything which they viewed as abuses and corruptions, the Reformers never ceased to acknowledge the manifold utility and high importance of the Sunday as a day of rest, worship, and decorous enjoyment. Like the later Fathers and the Schoolmen, also, they recognised in the fourth commandment a useful means of instruction and exhortation; but, as we have said, they utterly rejected it as a law. 'The Ten Commandments,' says Luther, 'do not apply to us Gentiles and Christians, but only to the Jews.' (*On the Ten Commandments*.) 'A law,' says Grotius, 'obliges only those to whom it is given; and to whom the Mosaic law is given, itself declares: "Hear, O

Israel." (*De Jure Belli et Pacis*, lib. i. c. i. s. 16.) He quotes also Deut. iv. 7, and Ps. cxlvii. 19, 20. This is not Antinomianism (q. v.): the Reformers acknowledged their subjection not only to the more perfect law of Christ, but to that universal and perpetual law which Paul (Rom. ii. 14) speaks of as the light to the Gentiles of old, who, 'not having the law, were a law unto themselves, shewing the work of the law written in their hearts.' See ETHICS.

The distinction, however, between Moses as a lawgiver and Moses as a teacher, was one very apt to be overlooked by the multitude, and disregarded in popular discourses by the clergy themselves. In England, where the writings of the Reformers were less studied than in Germany, the response after the fourth commandment in the Liturgy (where the Decalogue, adapted to general use by the omission of the words addressing it to the Jews, was inserted in 1552), 'Lord, have mercy upon us, and incline our hearts to keep *this law*,' must have greatly tended to instil the belief that this commandment imposed on them the duty of keeping, not a mystical, but a literal Sabbath. Accordingly, in the reign of Elizabeth, it occurred to many conscientious and independent thinkers (as it had previously done to some Protestants in Bohemia), that the fourth commandment required of them the observance, not of the first, but of the specified *seventh* day of the week, and a strict bodily rest as a service then due to God; while others, though convinced that the day had been altered by divine authority, took up the same opinion as to the Scriptural obligation to refrain from work. The former class became numerous enough to make a considerable figure for more than a century in England under the title of 'Sabbatarians'—a word now exchanged for the less ambiguous appellation of 'Seventh-day Baptists.' The other and much larger class were the Puritans (q. v.), who, justly offended by the vices and frivolity of the times, but also soured by persecution, applying to themselves the threats of Jehovah against the profaners of the token of the covenant between him and his chosen people—led astray by the mistranslation of Is. lviii. 13 above noticed—overlooking the incidents in Luke xiv. 1—12—and giving a narrower scope than the Reformers had done to the teaching of Paul—added to Sunday-keeping an austerity by which neither it nor the S.-keeping of the Jews had ever before been marked. (See ASCETICISM.) This great party, when predominant for a time in the reign of Charles I., availed themselves of the opportunity to maintain and spread their Sabbatarian opinions, not only in numerous treatises, but through what has proved to be the more lasting and influential means of the *Westminster Confession and Catechisms*. (See ASSEMBLY OF DIVINES; CATECHISMS; CREEDS AND CONFESSIONS.) Chiefly through these formularies was effectually introduced into Scotland that scrupulous abstinence from recreation as well as business on Sunday, which still distinguishes the people. For it is a mistake to suppose that either Sabbatarianism or asceticism was recommended by Knox. Agreeing with the other Reformers, Knox, in setting forth in his *Confession of Faith* (1560) 'the works of the First Table,' says not a word about the Sabbath. This *Confession* and the *Geneva Catechism* were adhered to in Scotland till superseded in 1648 by the Westminster standards of faith. Nor is it only to the British Presbyterians that the opinions and habits of the Puritans have descended; as the colonists of New England they planted in that distant soil the rigid Sabbatarianism which still survives in Massachusetts and Connecticut, and retains the Jewish peculiarity (which found its

chief advocates in Prynne and Shepard, 1655) of being observed from sunset to sunset. In America, too, exists now the principal remnant of the Seventh-day Baptists. (See RUPP'S *Relig. Denom. in the United States*, pp. 70—111; Mr Davis's *History of the Sabbatarian Church*, Philad. 1851; and the publications of the American (Seventh-day) Sabbath Tract Society, New York, 1852, &c.) They have nearly disappeared in England, though in the 17th c. so numerous and active as to have called forth replies from Bishop White, Warren, Baxter, Bunyan, Wallis and others.

In Holland, though some English Puritan settlers gave birth to a controversy which, during the greater part of the 17th c., engaged the pens of many of the most eminent divines (among whom were Gomarus, Walaeus, Rivetus, Cocceius, and F. Eermann), the principles of the Reformers, favoured by Grotius among the laity, ultimately kept the ground, as they have done also in Protestant Germany. Yet in Holland were produced the two bulkiest defences of Sabbatarianism that have ever been published—one, in Latin, by John Bruns, an expatriated Scotchman who had been minister of Wamphray, entitled *Causa Dei contra Anti-Sabbatarios* (2 vols., Rotter. 1674—1676); and the other, in Dutch, by his friend James Koelman: *The Controversy, History, and Manner of Prevalence of the Sabbath and the Lord's Day* (Amst. 1685).

In England the earliest considerable treatise on the Puritan side was the *Sabbathum Veteris et Novi Testamenti* of Dr Nicolas Bound, a minister in Suffolk (Lond. 1595; 2d ed. 1606). It is written in English, though the title is partly Latin. Many converts were made by it and the similar works of Greenham and Witley, his contemporaries; and till the heterodoxy of the Seventh-day Baptists Brabourne aroused, in 1632, the indignation of the bishops, little noise seems to have been made throughout the nation by the controversy; nor would it, perhaps, have ever attained much prominence, had not Charles I. committed, in 1633, the blunder, and, as the Puritans believed, the impiety, of reviving his father's *Declaration concerning Lawful Sports to be used [on Sundays]*. (See SPORTS, BOOK OF.) This the clergy were required by Law (q. v.) to publish in their churches, and many who refused were punished severely. Hence arose the greatest English controversy about it, between the High-Church party on the one hand, and the Puritans on the other. Bishop White (*Treatise of the Sabbath-day*, 1635) and Dr Heylin (q. v., *History of the Sabbath*, 1636) took the lead in the former, and were ably supported by Sanderson's *Sovereign Antidote against Sabbatarian Errors*, 1637; Ironside (*Seven Questions of the Sabbath briefly disputed*, 1637), Taylor (*Holy Living*, ch. iv. s. 6, *Ductor Dubitantium*, b. ii. ch. ii. rule 6, s. 43—6, and Bramhall (*On the Controversies about the Sabbath and the Lord's Day*, in his *Works*, fol. p. 97). On the Puritan side were Henry Burton (*The Lord's Day the Sabbath-day*, 1636), John Ley (*Surveys of the Sabbath*, 1641), Hamon L'Estrange (*God's Service before the Law, under the Gospel*, 1641), Richard Bernard (*A Threefold Treatise of the Sabbath*, 1641), William Twisse, prolocutor of the Westminster Assembly (*Of the Morality of the Fourth Commandment, as still in force to Christians*, 1641), and jointly Cawdrey and Packer, two members of the same Assembly, in their *Sabbatum Redivivum, or the Christian Sabbath Tractate* (2 vols. 1645—1652), which is the most elaborate defence of Sabbatarianism in our language. A still more eminent writer on that side, and one of greater breadth of view, was Dr John Owen, whose

Exercitations concerning a Day of Sacred Rest (1671), since prefixed to his *Exposition of Hebrews*, gave, however, some offence to his friends by suggesting that the duration of the religious exercises of the day should be measured by the strength of the worshipper. Since then, the Sabbatarian cause has been maintained by numberless writers, among whom may be mentioned Bishop Hopkins, Willison, Jonathan Edwards, Dwight, Stopford, Macfarlan, and others to be afterwards named; while the opposite side is supported by Baxter, Milton, Barrow, Barclay, Morer, Michaelis, Paley, Evanson, Higgins, &c.

In the first half of the reign of George III., the comparative neglect into which the observance of the Lord's Day had fallen in England aroused the anxiety of its friends, and many efforts were made to bring the people to a better disposition towards it. Paley did excellent service, especially by his chapter on the use of Sabbatical Institutions (*Moral Philosophy*, b. v. ch. vi.); while Bishop Porteus successfully exerted himself to check open indulgence in vicious and unseemly amusements. About the same time, the new 'Evangelical' party (q. v.) began those efforts which it continues to make for the promotion of a strict observance of Sunday according to the Puritan model. But what, perhaps, had most effect in turning the current of public opinion in that direction was the substitution of the Decade (q. v.) for the Week, and the abolition of public worship, by the National Convention of France in 1793 (see *CALENDAR*); proceedings which brought to the aid of the pious advocates of the Lord's Day the political conservatism and anti-Gallican feelings of the British people. In the next generation, the revival of the study of ancient Christian literature led to fresh advocacy of the Lutheran views concerning the S. and the Lord's Day, by Bishop Kaye (*On Justin Martyr*, 1829), Dr Whately (*Thoughts on the Sabbath*, 1830), Mr Bannerman (*The Modern Sabbath Examined*, 1832), and the Oxford 'Tractarians'; while Sabbatarianism had influential advocates in Bishop Mant (*The Christian Sabbath, its Institution and Obligation*, 1830), Dr Daniel Wilson, afterwards Bishop of Calcutta (*The Divine Authority and Perpetual Obligation of the Lord's Day Asserted*, 1830), and Dr Ralph Wardlaw (*Discourses on the Sabbath*, 1832)—in support of whose principles was founded in 1831 the London 'Society for Promoting the Due Observance of the Lord's Day,' which, aided by similar associations in Scotland and the United States, still keeps a jealous watch on behalf of the institution. For 17 years preceding his death in 1849, its most noted member, Sir Andrew Agnew, M.P. for Wigtownshire, fought indefatigably both in and out of the House of Commons for a stricter legal enforcement of rest on Sunday; and though he failed to get his bill passed, the agitation which he headed was not wholly fruitless. The attempts, however, which he and his friends have made to suppress all post-office action on Sunday, all stated conveyance of passengers on railways, and such recreations as walking in public gardens, listening to music in the London parks, and viewing works of nature and art in the national collections, have seemed, even to many friends of the institution, to display more real than wisdom or knowledge, and have led to the formation (in 1855) of 'The National Sunday League,'—a society which, while deprecating the conversion of any part of the day into a season for ordinary labour, or for frivolous or vicious amusement, conceives that a more cheerful mode of spending some of its hours is expedient, and that the opening of public gardens, museums, and galleries of art, would promote alike the health

and the moral and intellectual elevation of the people.

In France, where the Week was restored by Napoleon I. in 1806, the Sunday has not yet wholly recovered its former status as a day of rest; but efforts have lately been made by both clergymen and laymen to convince the people of the advantage of suspending all but necessary labour upon it. Among the advocates of this reform are Pérennes, Gaume, and Mullois, who, however, discountenance the austerity of the Puritans. In Switzerland, Mellet, the pastor of Yverne, is the author of a clever treatise on *Sunday and the Sabbath*, of which there is an English translation (Lond. 1856). Bred a Sabbatarian, he was converted to the Dominical view by reading Dwight's *Sabbatarian Discourse on the Perpetuity of the Sabbath*, a doctrine still upheld by the 'evangelical' party in Switzerland.

Of late years the bearing of geological discovery on the interpretation of the Hebrew narrative of the creation, and consequently on the S. controversy, and, in particular, on questions arising out of the discrepancy between the two copies of the fourth commandment, has been largely discussed. See *GENESIS; DECALOGUE*. Into the merits of this and other disputed points it is impossible to enter here; but, in concluding the present historical sketch, it may be allowable to express the satisfaction with which we observe, that notwithstanding the wide diversity of opinion as to the authority of the Lord's Day and the manner in which it may and ought to be spent, almost all agree in esteeming it highly as a civil institution at least, and in wishing to defend it from the intrusion of business as far as the public good will allow.—For additional information and discussion, see (on the Sabbatarian side) Holden's *Christian Sabbath* (Lond. 1825); *Report from the Select Committee of the House of Commons on the Obs. of the Sabbath-day* (Sir A. Agnew's committee), 6th August 1832; Jordan's *Scriptural Views of the Sabbath of God* (Lond. 1848); McOrie's *Memoirs of Sir A. Agnew* (Edin. 1850); Pirret's *Ethics of the Sabbath* (Edin. 1855); Fairbairn's *Typology of Scripture* (3d ed., Edin. 1857); J. Gilfillan's *Sabbath viewed in the Light of Reason, Revelation, and History, with Sketches of its Literature* (Edin. 1861); and (on the Dominical side) Arnold's *Sermons*, vol. iii. (Lond. 1844), and his *Life by Stanley*, 5th ed. vol. i. p. 364, and vol. ii. p. 206; Neale's *Feasts and Fasts* (Lond. 1845); Sir W. Domville's *Examination of the Six Texts commonly adduced from the New Testament in proof of a Christian Sabbath* (Lond. 1849); Hengstenberg on *The Lord's Day*, translated by J. Martin (Lond. 1853); F. D. Maurice's *Sermons on the Sabbath-day* (Lond. 1853); R. Cox's *Sabbath Laws and Duties* (Edin. 1853); Domville's *Inquiry into the supposed Obligation of the Sabbath of the Old Testament* (Lond. 1855); *Sunday the Rest from Labour*, by a Christian (Lond. 1856); Dr W. F. Hook on *The Lord's Day* (Lond. 1856); *Time and Faith* (Lond. 1856); Alford's *Greek Testament with Commentary* (Lond. 1856—1861); F. W. Robertson's *Sermons*, 1st and 2d series (Lond. 1856); Baden Powell's *Christianity without Judaism* (Lond. 1857); Reichel's *Lord's Day not the Sabbath* (Dubl. 1859); W. Logan Fisher's *Hist. of the Institution of the Sabbath-day, its Uses and Abuses*, 2d. ed. (Phila. 1859); Dr J. A. Hessey's *Sunday: its Origin, History, and present Obligation*, being the Bampton Lectures for 1860; and the *Edin. Review* for October 1861, p. 535. Of the British Seventh-day Baptists the principal works are those of Brabourne (1632), F. Bampfield (1677), Cornthwaite (1740), and Burnside (1825). The Roman Catholic doctrine respecting the Lord's Day, is amply stated in *The Catechism*

From this period, his history is that of a studious investigator into the laws and phenomena of nature, broken only by a short term of military service in Ireland, during which he rose to the rank of major. In 1836 he communicated to the British Association at Bristol his observations on the declination and intensity of the magnetic force in Scotland; and to the same association, he delivered, at Liverpool, in 1837, a report on the variations of magnetic intensity at different parts of the earth's surface. The rest of his researches into the nature and action of magnetic force will be found in detail in the *Transactions* of the above-mentioned association, of the Royal Society, and in the *Philosophical Transactions*. His labours have led to the discovery of the laws of 'magnetic storms,' of the connection between certain magnetic phenomena and the changes of the solar spots, and of the magnetic action (independently of heat) of the sun and moon on the earth. He deserves almost the sole credit of extending the body of known facts in magnetic science by the establishment of magnetic observatories in all parts of the world, and by the collation of the enormous mass of facts thus acquired. In 1818, S. was elected a Fellow of the Royal Society; on the retirement of Mr George Rennie (q. v.) in 1850, he became its Vice-president and Treasurer, and President in 1861. In 1852, he presided over the meetings of the British Association at Belfast, and has for a series of years been the general secretary of this association. In 1856, he was raised to the rank of major-general, and in 1869 was created a Knight-Commander of the Bath.

SABINE, a river of the United States of America, rises in the north-eastern part of Texas, and flows south-easterly 250 miles to the eastern boundary of Texas, whence flowing southerly, it forms the eastern boundary, and empties itself through Sabine Bay, 18 miles long by 9 miles wide, into the Gulf of Mexico. The S. is 500 miles long, but shallow and unnavigable.

SABINI, an ancient people of Central Italy, whose territory lay to the north-east of Rome. The boundaries of the territory cannot be determined with exactness, but it appears to have extended from the sources of the Nar, on the borders of Picenum, as far south as the Anio. The nations conterminous to the S. were the Umbrians on the north, the Umbrians and Etruscans on the west, the Latins and Æqui on the south, and the Marsi and Picentini on the east. The entire length of the Sabine territory did not exceed 85 miles, reckoning from the lofty and rugged group of the Apennines, anciently known as the *Mons Fucellus* (now *Monti della Sibilla*), to Fidenæ on the Tiber, which is not more than 5 miles from Rome. The principal towns were Reate, Interocrea, Falacrinum, Nursia, Amiternum, Casperia, and Cures, but none of these places were of any size or political importance. The inhabitants had no inducements to congregate in large towns. Their country was an interior region; much of it, especially in the north, very mountainous and bleak, though the valleys were (and are) often richly productive; and thus cut off from the seaboard, and even from that easy access to their neighbours which lowland districts admit of, they (like all the other races who peopled the sequestered regions of the Apennines) scarcely advanced beyond the rude simplicity of their primitive highland hamlets. The Sabines were a brave, stern, religious race, whose virtues were all of an austere and homely character. Cicero speaks of them as *severissimi homines*, and Livy notes the *disciplina tetrica ac tristis veterum Sabinorum* ('the stern and grave discipline of the old Sabines'),

while the poets of the Empire—Horace, Virgil, Juvenal, &c., are fond of contrasting their simple uncontaminated modes of life with the vicious luxury and dissipation of the capital. What part, if any, they had in the foundation of the city of Rome, cannot now be ascertained, as the whole story of the Ramnes, Tities, and Luceres has come down to us in a purely mythical form (see *ROME*). Their native tutelary deity was 'Sancus,' or 'Semo-Sancus' = Lat. *Sancus*, the 'Holy' or 'Venerable'; but like the other Latino-Sabellian races, they also worshipped Jove, Mars, Minerva, Sol, &c. That the S. were an ancient people in Italy, is certain. They were probably most nearly allied to the Umbrians, whose tutelary god was also 'Semo-Sancus'; and, in fact, they are generally considered an offshoot of that people; but they themselves, on the other hand, became so numerous that they were obliged to send forth numerous colonies, who founded new nations to the south and east, the Picentes, Peligni, Samnites (q. v.) &c.; while the Samnites (a name essentially the same as *Sabini*; the Greek form *Saunitai* = *Sav-nita* = Oscan name *Safai* or *Safini*) in their turn became the progenitors of the Lucanians, Campanians, and Bruttii. Hence the epithet, *Umbro-Sabellian*, in use among classical ethnologists, to denote the whole of these kindred races, who were also allied, but less closely, to the Latins (see *LATINI*) and Oscans (see *OSCI*). Of the Sabine language, only a few words remain, which, however, seem to indicate that it differed from the Latin only dialectically: thus, Lat. *hircus*, Sab. *fircus*; Lat. *hostia*, Sab. *fostia*, &c.; analogous to the Aberdeen *filk* for 'whilk,' *fat* for 'what,' &c. For further information, see *ROME*, *HISTORY* OF.

SABLE (*Martes zibellina*), a species of *Martes* (q. v.), so nearly allied to the Common Marten and Pine Marten, that it is difficult to state satisfactory specific distinctions. The feet are covered with fur, even on the soles, and the tail is perhaps more

Sable (*Martes zibellina*).

bushy than in the British martens. The length, exclusive of the tail, is about 18 inches. The fur is brown, grayish-yellow on the throat, and small grayish-yellow spots are scattered on the sides of the neck. The whole fur is extremely lustrous, and hence of the very highest value, an ordinary S. skin being worth six or seven pounds, and one of the finest quality fifteen pounds. The fur attains its highest perfection in the beginning of winter, and the pursuit of the S. at that season is one of the most difficult and adventurous of enterprises. The S. is a native of Siberia, widely distributed over that country, and found in its coldest regions, at least wherever forests extend. The progress of geographical discovery in the eastern parts of Siberia has been much indebted to the expeditions of the hardy and daring S.-hunters, exploring new regions at the worst seasons of the year, and

spending dreary months at a great distance from all human abodes. The S. is taken by traps, which are a kind of pitfall, it being necessary to avoid injury to the fur, or by tracking it through the snow to its hole, and placing a net over the mouth of the hole. It is a very wary animal, and not easily captured. It makes its nest in a hollow tree, or sometimes, it is said, by burrowing in the ground, and lines it with moss, leaves, and grass. From this, it issues to prey on hares and smaller animals of almost any kind, its agility enabling it even to catch birds among the branches of trees. It is ready, when food is scarce, to eat the remains of an animal on which a larger beast of prey has feasted, and is said even to satisfy its hunger with berries in winter, when animal food is not to be had.

SABLE, one of the tinctures in Heraldry, implying black. In heraldic engravings, it is represented by perpendicular and horizontal lines crossing each other.

SABLE ISLAND. See *NOVA SCOTIA*.

SABLES D'OLONNE, LES, a seaport of France, in the dep. of Vendée. It owes its early importance to Louis XI., who excavated the port, and raised the fortifications. In 1688, its merchant marine was more important than that of either Nantes or Rochelle. The commerce is in grain, wines, cattle, fish (sardines), salt, &c. Pop. (1872) 7925, who are almost all engaged in a seafaring line of life.

SABOTS, a species of wooden shoes much used by the French and Belgian peasantry, especially by those who inhabit moist and marshy districts, as an effectual protective of the feet from external moisture. The fabrication of sabots forms an important branch of French industry, and is chiefly carried on in the depa. of Aisne, Aube, Maine-et-Loire, and Vosges. After being made, they are subjected to the smoke of burning wood, till they acquire that reddish colour so much prized in certain countries.

SABRE, a heavy sword, with which dragoons are armed. The back is thick, that a blow may carry the more force, and also to render the weapon useful in the rough thrust of a cavalry charge. A sabre is occasionally curved at the point, in the form of a scimitar.

SABRE-TA'OHE (Ger. *Säbeltasche*, sword-pocket), a useless square accoutrement which dangles against the legs of officers in some cavalry regiments. It purports to be a pocket for the conveyance of dispatches, &c., but probably is never used. The sabre-tache is hung by smaller ornamental belts from the sword-belt, and is itself covered with gold brocade, the emblems of the regiment, and other devices.

SABRINA LAND, discovered in the Antarctic Ocean, March 20, 1839, by Balleny, in lat. 69° 58' S., long. 121° 8' E. See *ANTARCTIC OCEAN*.

SACCHARIC ACID ($2\text{HO}, \text{C}_6\text{H}_4\text{O}_6$) is a product of the action of nitric acid, under certain conditions, on grape and cane sugar, or on starch, gum, and lignine. It occurs as a colourless, inodorous, deliquescent, gummy, uncrystallisable mass, which is freely soluble in alcohol. It is sufficiently powerful to dissolve iron and zinc, with extrication of hydrogen. It has a tendency to form double salts, so that it is probably a bibasic acid.

SACCHAROMETER, an instrument for determining the quantity of sugar in liquids, especially brewers' and distillers' worts. In principle, it resembles the hydrometer, used for ascertaining the strength of alcoholic liquids. It consists of a

hollow sphere or oval of thin brass, with a graduated stem and a hook so placed opposite each other, that when placed in water, it floats, and the graduated stem stands upright on the top, and the hook is below, for the purpose of appending weights. The degree to which the stem sinks gives the means of calculating, by tables prepared on purpose, the proportion of saccharine matter present in the liquid.

SACCHARUM. See *SUGAR-CANE*.

SACCOTOO. See *SOKOTO*.

SACHEVEREL, HENRY, D.D., was born in the year 1672, at Marlborough, where his father was minister of St Peter's Church, and noted for his attachment to the High Church principles, which were afterwards embraced by his son. The youth was educated at the grammar-school of his native place, and at Magdalen College, Oxford, where he occupied chambers along with the celebrated Addison, who then and for many years afterwards seems to have entertained for him a warm regard. He obtained a fellowship in his college, and took successively the degrees of M.A. (1696), of B.D. (1707), and of D.D. (1708). In 1705, he became preacher of St Saviour's, Southwark; and in 1709, he delivered the two sermons—one at the assizes at Derby, the other on the 5th November at St Paul's—which have given him a place in the history of his country. The rancour with which he attacked in these sermons the principles of the Revolution Settlement, asserted the doctrine of non-resistance, and decried the Act of Toleration, excited the indignation of the Whig government of the hour, and led to his impeachment for high crimes and misdemeanours. His trial before the House of Lords took place in the spring of 1710, and resulted in his being found guilty, and suspended from preaching for three years, the obnoxious discourses being ordered to be publicly burned by the hangman. Of the rage of factions on the occasion, the fury of the popular excitement, and the excesses of the High Church party, an account in detail will be found in any history of the period. S. became for the time the most popular man in the kingdom, and the general election which followed was fatal to the government which had prosecuted him. When, in 1713, his suspension as by sentence expired, as a special mark of honour he was appointed by the new House of Commons to preach before them the sermon on the anniversary of the Restoration, and specially thanked on the occasion. A more substantial token of favour was his presentation to the rectory of St Andrew's, Holborn. Subsequently—except that there is some reason to believe he was more or less concerned in a plot to restore the Stuarts—he disappears from the sphere of history. He is said, in his later years, to have sought the excitement which may in some sort have become necessary to him, in a series of paltry and undignified squabbles with his parishioners. Nor in this is there anything improbable. His character was essentially a weak, vain, and shallow one, and he remains notable merely as one of those men, intrinsically insignificant, who have had a spurious notoriety and importance thrust upon them by the accident of foolish activity in a special concurrence of circumstances.

SACHS, HANS, the most prolific and at the same time the most important German poet of his time, was born on the 5th of November 1494, at Nürnberg, where his father was a tailor. While at school, he learned the rudiments of Latin, but at no time of his life could he be called a scholar in the strict sense of the term, although he was certainly a well and widely-informed man. About the age of

15, he was sent to learn the craft of shoemaking; his love of verse, however, also led him to become a disciple of Leonhard Nunnenbeck, weaver and *meistersinger* in his native town. On finishing his apprenticeship, S., as was the custom of craftsmen in those days, made a sort of tour or pilgrimage through Germany, frequenting assiduously the verse-making schools or corporations organised by the trade-guilds in the different cities, the members of which, known as *meistersingers*, had, since the disappearance of the older *minnesingers*, or minstrels of chivalry, become the chief representatives of German poetry. On his return to Nürnberg, he commenced business as a shoemaker, prospered in his calling; and after a long, cheerful, and happy life, died on the 25th of January 1576, at the age of 82. S. was twice married—first to Kne-gunda Kreutzer, who bore him five sons and two daughters; and afterwards, in his 66th year, to Barbara Harscher. His grave is still to be seen in St John's churchyard, Nürnberg. S.'s career as an author is divided into two periods. In the first, he shews an interest mainly in the occurrences that were then agitating Germany. It was the epoch of the Reformation of Luther, whose praises he celebrated (1523) in an allegorical tale entitled *Die Wittenbergisch Nachtigal*, while his poetical fly-sheets (of which about 200 are known) furthered in no small measure the Protestant cause. In the second period, his poetical activity was turned more to the delineation of common life and manners. His poetry is distinguished by its heartiness, good sense, homely genuine morality, and freshness; its clear and healthy humour, and its skilful manipulation of material. It is, on the other hand, deficient in high imagination and brilliant fancy, and contains large tracts of dry, prosaic, insipid verse. S.'s best productions are his *Schwänke*, or Merry Tales, the humour of which is sometimes unsurpassable; but his serious tales, allegorical and spiritual songs, and his dramas, also shew a great advance on his predecessors. His special *meistergesänge*, on the other hand, are of little or no value. Manuscript copies of S.'s poems—some in his own handwriting—are to be seen in the libraries at Zwickau, Dresden, Leipzig, and elsewhere. When S. had reached the 52d year of his career as a poet, he took stock of his work, and found that he had written 34 vols., containing upwards of 6200 pieces, among which were 4275 *meistergesänge*, 208 comedies and tragedies, about 1700 merry tales, secular and religious dialogues, proverbs, and fables, 7 prose dialogues, and 73 songs, secular and devotional. The first edition of his works was published at Augsburg in 1558, but the best is that of Willer (5 folio vols. 1570—1579); a later quarto edition, known as the *Kemptener*, appeared in 1612—1617, and was republished at Augsburg in 1712. After the middle of the 17th c., when a deep stupor seized the German mind, and it could produce nothing but tomes of idle theology, varied by an occasional hymn of more or less merit, S., with all his poetic brethren, suffered a total neglect, from which he did not recover till Goethe wrote his pleasant poem, *Hans Sachs, Erklärung eines alten Holzschnitts vorstellend Hans Sachs's poetische Sendung* (1776), since which time partial collections of S.'s works have frequently appeared.

SACK, a large bag made of a coarse hempen cloth called sackcloth. Such bags are used for the conveyance of corn, flour, and other bulky articles. A corn-sack is usually made to contain four bushels, hence it is constantly spoken of as a measure of quantity, two sacks being equal to one quarter of corn.

SACK. A name in common use in the time of Shakespeare, and occurring down to the middle of the 18th c. as denoting a kind of wine. The exact nature of this famous wine, the favourite beverage of Falstaff, and the origin of the name, have been much discussed. Sack or seek seems to be simply an English disguise of the Spanish *seco* (Fr. *sec*), applied to wines of the sherry genus, as distinguished from the sweet wines; a term which we now translate by 'dry.'

SA'CKBUT (Fr. *saquebute*), the name under which the Trombone (q. v.) was known on its first introduction to England.

SA'CKETTS HARBOUR (in America, it is spelled Harbor), a village and port in New York, U. S., on the south shore of Black River Bay, 5 miles east of Lake Ontario, 170 miles west-north-west of Albany, having a navy-yard, barracks, mills, &c. In the war of 1812, it was an important port, where the frigate *Superior*, of 66 guns, was built in 80 days, and the *Madison* in 45 days, from timber standing in the forest. A man-of-war of 3200 tons, begun before the treaty of disarmament, is still upon the stocks. The town has declined since the war, and has now a population of but 200 or 3000.

SACKVILLE, THOMAS, Earl of Dorset, an English poet and statesman, was born at Buckhurst, Sussex, in 1536. He was the only son of Sir Richard Sackville; studied at Oxford and Cambridge, where he acquired a high reputation as a poet both in Latin and English, and afterwards became a student of the Inner Temple. While a member of this society, he wrote, along with Thomas Norton, a blank-verse tragedy, called *Ferrex et Porrex* (afterwards called *Gorboduc*), which was performed before Queen Elizabeth at Whitehall in 1561—1562. This work, the plot of which is founded on a British legend, claims particular notice as the earliest tragedy in the English language. It is moulded to some extent on the classic drama, the incidents being moralised at intervals by a chorus. It has no dramatic life or energy, but the style is pure and stately, evincing eloquence and power of thought. S.'s other productions (first published in 1563) are the *Induction*, a poetical preface to the *Mirror for Magistrates*, and the *Complaint of the Duke of Buckingham*, which was designed to conclude the work. The *Induction* is a noble poem uniting, as Hallam says, 'the school of Chaucer and Lydgate to the *Fairy Queen*,' and almost rivaling the latter in the magnificence and dignity of its allegoric personifications. The influence of Dante is very perceptible. S. now abandoned literature, and after travelling in France and Italy, returned to England, and entered public life. Soon after his father's death in 1566, he was created Lord Buckhurst, became a favourite with the queen, was employed him in foreign diplomacy, and on the death of Burleigh, succeeded him in his office of Lord High Treasurer (equivalent to Prime Minister in those days), in which capacity he shewed himself not inferior in sagacity and fidelity to his great predecessor. On the accession of King James, his patent of office was renewed for life; and in the following year, he was created Earl of Dorset. He died April 19, 1603, and was buried with ceremony in Westminster Abbey. His works are edited by the Rev. Sackville West, in *Smith's Library of English Authors* (Lond. 1859).

SA'CO, a river of New England, U. S., rises in the White Mountains of New Hampshire, flows south-easterly through the south-western part of Maine, through Saco Bay, to the Atlantic Ocean. Its course of 160 miles is almost a continuous

SACO—SACRAMENTARIAN.

succession of falls, the last being but 4 miles from its mouth, affording water-power to numerous factories.

SACO, a town in Maine, U.S., is built on the east bank of the Saco River, at its last falls, 4 miles from its mouth, 14 miles south-west of Portland. It has numerous manufactories, including 5 cotton-mills, which produce 7,000,000 yards annually, 4 saw-mills, and several ship-yards. Pop. (1870) 5755.

SACRAMENT (Lat. *sacramentum*, *mysterium*, Gr. *mysterion*), the name given by theological writers to certain religious rites, the number as well as effects of which are the subject of much controversy between various bodies of Christians. The word *sacramentum*, in primitive classical usage, meant either the oath taken by soldiers on their first enrolment, or the sum of money deposited by suitors on entering upon a cause, and forfeited 'to sacred uses' by the unsuccessful party; and the corresponding classical Greek word *mysterion* meant not merely the secret religious ceremonies practised in the worship of certain gods, but also any revealed secret. It is certain, nevertheless, that at a very early period of the Christian Church, both the Latin word and its Greek equivalent came to be applied specially to certain rites of the Christian ceremonial, and chiefly (or as is commonly held by Protestants, exclusively) to those of baptism and the Eucharist. Of the catechetical lectures of St Cyril of Jerusalem, the lectures devoted to the subject of baptism and the Eucharist are called 'mystagogic lectures.' For our purposes, it will be enough to state concisely what are the views of the several religious communities on this much controverted subject, which formed one of the earliest grounds of division between the Roman Church and the Reformers of the 16th century.

In the Roman Church, it is held that there are seven sacraments, viz.: Baptism, Confirmation, the Eucharist, Penance, Extreme Unction, Holy Orders, and Matrimony. The special teaching of Catholics on each of these rites will be found under the several heads; but there are certain general principles regarding them all, on which the Roman Catholic doctrine differs widely from that of the Reformed communities. Catholics define a sacrament to be a visible or sensible sign permanently instituted by God, and conveying real interior grace to the recipient, and they teach that all sacraments contain within themselves, as instruments, and, when they are received with proper dispositions, produce such grace by the virtue imparted to them by God, and not merely through the faith of the recipient; although they hold that proper dispositions on the part of the recipient, as sorrow for sin, love of God, pious resolves, &c., are conditions indispensable for the efficacy of the sacramental rite. See *OPUS OPERATUM*. They divide the sacraments into two classes, 'sacraments of the living,' and 'sacraments of the dead.' The first class comprises the Eucharist, Confirmation, Holy Orders, and Matrimony—all which sacraments can only be received fruitfully by persons in a state of grace or justification. The second includes Baptism, Penance, and Extreme Unction, the special purpose of which is to remit sin, and which therefore can be received by persons in a state of sin, but penitent for that sin, and resolved to amend their lives. Of three of the sacraments, viz., Baptism, Confirmation, and Holy Orders, it is held that they imprint a 'character,' and therefore that they can only be received once. The others may be repeatedly received, but under conditions which will be learned under each separate sect. Two things are held to enter into the

constitution of the sacrament—viz., the 'matter' and the 'form.' By the former is meant the material element or the physical action whereby that element is applied to the recipient of the sacrament; as water in baptism, oil in extreme unction, and in both the act of washing or of anointing. By the latter is understood the form of words employed by the minister in communicating to the recipient the external rite in which the sacramental act consists. The minister of a sacrament is the person who is supposed to be divinely authorised to impart it. The minister is different for different sacraments, as will be found under each separate head.

The Reformed Churches have for the most part discarded these views. By the majority of them, the sacraments are held to be merely ceremonial observances, partly designed as a solemn act, by which each individual is admitted to membership, or desires to make solemn profession thereof; partly intended to stimulate the faith and excite the fervour and the pious dispositions of the recipient, to which dispositions alone all the interior effects are to be ascribed. As to the number of rites called by the name, almost all Protestants agree in restricting it to two—viz., Baptism and the Lord's Supper; although some of the rites which Catholics regard as sacramental are retained by some of the Protestant communities as religious observances. In the English Church, however, there has always been a school in which opinion tending towards the Catholic view has prevailed. Not only has this school ascribed to the two rites of Baptism and the Eucharist or Lord's Supper (q. v.) the power of producing an interior grace (which in the former is called regeneration); but many of them have been willing to call the other rites, especially confirmation, penance, and holy orders, by the name of sacrament, although of a secondary character, and not 'generally necessary to salvation.' See *TRAC-TARIANISM*. The controversy on these questions has been in recent times the subject of more than one proceeding in the ecclesiastical courts and in the Privy Council.

SACRAMENTARIAN, the name given in the 16th c. to the party among the Reformers who separated from Luther on the doctrine of the Eucharist. Luther (q. v.) taught the doctrine of the real presence of the body and blood of Christ along with the bread and wine (see *LORD'S SUPPER*; *REAL PRESENCE*). The first of his followers who called this doctrine in question was Andrew Carlstadt; and notwithstanding the protest of his leader, Carlstadt had many followers, the most active of whom were Capito and Bucer. The party became so considerable, that in the diet of Augsburg they claimed to present a special confession distinct from that put forward by the general body. The sacramentarian confession is known in history by the name of the Tetrapolitan Confession—so called from the four cities, Straßburg, Constance, Lindau, and Memmingen. The Tetrapolitan Confession rejects the doctrine of a corporeal presence, and although it admits a spiritual presence of Christ which the devout soul can feel and enjoy, it excludes all idea of a physical presence of Christ's body. Simultaneously with this German movement, yet independent of it, was that of the Swiss reformer Zwingli, whose doctrine on the Eucharist was identical with that of Carlstadt, and who himself presented a private confession of faith to the Augsburg diet, in which this doctrine is embodied. The four cities named above continued for many years to adhere to this confession presented to the diet of Augsburg in their name; but eventually they accepted the so-called Confession of Augsburg, and were merged in the general body of Lutherans.

On the contrary, the article of Zwingli upon the Eucharist was in substance embodied in the confession of the Helvetic Church.

SACRAMENTO, a city and port of entry and capital of California, is built on the east bank of the Sacramento River, 125 miles from the sea, lat. 38° 33' N., long. 121° 20' W. The streets cross each other at right angles on a level plain, only 30 feet above the sea. The stores and shops are built of brick, the dwellings of wood, with shade-trees and gardens. The principal public buildings are the state capitol, custom-house, and post-office. The chief trade is furnishing supplies to the mining districts, with which it has daily communication by steamers and stages. S. was settled in 1839 by Captain Sutter, a Swiss, who built a fort. In 1848, the first town-lots were sold, and the first house built in 1849. In 1853, the town was inundated to the depth of 5 feet in the streets, which have been raised and protected by embankments. In 1864 it became the state capital, and in 1870 had a population of 16,283.

SACRAMENTO, a large river in California, U.S., which, with the San Joaquin, drains the Great Central Valley. It rises in the north-eastern part of the state, in the Sierra Nevada, by North and South Forks, where, during its south-westerly course of 200 miles, it is called Pitt River and Upper Sacramento; thence it flows nearly due south, receiving numerous branches from the Sierra Nevada on the east, and the coast-range of mountains on the west, until it unites with the river San Joaquin, and flows westerly through San Pablo and San Francisco bays to the Pacific Ocean. It is navigable to Sacramento, 60 miles from San Pablo Bay, and for small vessels 160 miles further, its entire length being about 500 miles.

SACRA'RIMUM, a sacred apartment in Roman houses.

SACRED HEART OF JESUS, FEAST OF, a modern festival of the Roman Catholic Church. Its origin is traced to a vision which is recorded of a French nun, of the order of the Visitation, named Mary Margaret Alacoque, who lived at Paray la Moniale, in Burgundy, in the latter half of the 17th century. This devotion was gradually propagated in France, and at length was approved by Pope Clement XII. in 1732 and 1736, and by Clement XIII. in 1765. The festival is held on the Friday after the octave of Corpus Christi. During the last three years a fresh impulse has been given to the devotion, and in 1873 numerous bodies of pilgrims resorted to Paray la Moniale; and several dioceses and countries were dedicated to the Sacred Heart by special and solemn ceremonial. The confraternities of the Sacred Heart are very numerous.

SACRED MUSIC. Music has, from very early times, been connected with religious rites. It entered into the worship of the Jews, and both sacred and profane history tell us that, in the primitive Christian Church, the service consisted partly of music. Little is known regarding the kind of music used by the early Christian converts; it has been supposed to have been partly Greek, with an intermixture of Hebrew melody. As early as the time of Ignatius, who was a disciple of St John, the Psalms of David were sung *antiphonally*, as practised to the present day—i. e., by two choirs responding to each other, which had doubtless been formerly the practice among the Jews. At first, the whole congregation, clergy and laity, joined in the psalm; but difficulties and abuses having arisen from the growing neglect of musical culture, the Council of Laodicea, in 363, found it necessary, for the securing of decency and order in worship, to prohibit the laity from singing in church except in

certain chants of a very simple and popular character. From that period down to the Reformation, the music of the church was almost entirely surrendered to the clergy and trained musicians. See **PSALMODY**.

The first name of importance in the history of the music of the Western Church is St Ambrose, (q. v.), whose musical service (see **AMBERGIAN CHANT**) was reformed by Pope Gregory (see **GRIGORIAN CHANT**). The use of the organ in churches dates from about the 9th c., and some centuries later, Counterpoint (q. v.) was introduced to a limited extent into the music of the church. Among the corruptions which followed it, some are of a nature the very mention of which startles us. Not merely were popular melodies of a secular nature often taken and worked up into church music, but the secular words were actually transplanted into the religious compositions, being habitually given out by the tenor voice, while the actual solemn words of the church service were being sung by soprano, alto, and bass. Papal bulls having sought in vain to combat this abuse, it was brought under the cognizance first of the Council of Basel, and then of that of Trent. The Council of Trent prohibited the performance of any mass or motett of which profane words formed a part, and also of music founded on secular themes. Some compositions of Palestrina were singled out for praise, and their author was intrusted with the task of remodelling this part of religious worship. He composed three masses on the reformed principle, one of which, known as the *Missæ pape Mæcellæ* (so called as being a tribute of gratitude to the memory of that pontiff), may be looked on as having saved music to the church, by establishing a type far higher than anything that had preceded it, and still revered by all lovers of music. The *mass* (including the *offertory* and *gradual*) has always continued to be an important part of the sacred vocal music of the Roman Catholic Church, and affords large scope for the display of the higher qualities of musical composition.

Various new types of music sprang up in the different Protestant churches after the Reformation. The solemn and measured *chorale* (q. v.), or melody to which psalms or hymns are sung in unison, though generally associated with the Lutheran Church of Germany, was in reality handed down from a very early period. Psalmody in its modern sense may be considered to have originated in the 16th c., when Clement Marot, the court poet of Francis I., translated fifty-two of the Psalms into French verse. Psalm-singing was at first a fashionable amusement of the gay courtiers of Francis; but being taken up by the Reformers, was soon discountenanced by the Roman Catholics, and looked on as a badge of Protestantism. See **PSALMODY**.

In the full choral service of the Church of England, as performed in cathedrals and collegiate churches, the greater part of the prayers and the litany are intoned or read in monotone (see **INTONING**), the monotone being occasionally varied by harmony at the close. The Psalms and *Gloria Patri* are chanted with the accompaniment of the organ, as also are the various canticles; the latter, however, particularly the *Te Deum*, being often sung to rhythmical music of a more elaborate kind called *service*. The form of the Anglican chant now used for the Psalms seems to have been invented by Tallis. In the single chant, each verse is sung to the same music; in the double chant, the *verse* occupies two verses. The antiphonal chanting, with the Anglican double chant, has sometimes been objected to as repugnant to the proper expression of the words, as coupling verses between which there

SACRIFICE.

is a full stop in the sense, and as placing a full stop when the sense runs on; and among the High Church party there has been a disposition to recur to the Gregorian chants, whose indefinite musical expression, absence of rhythm, and uncertain accent, give them a power of bending to the requirements of the words. The Gregorian chant has, however, not succeeded in making its way into the service of any of the English cathedrals. The *anthem* forms a part of the complete musical service. It is somewhat similar in character to the motett of the Roman Catholic and Lutheran churches; a sacred cantata, in which the words are taken from the Psalms or other portions of Scripture; and the music is for solo, parts, or chorus, or a mixture of the three.

In the Presbyterian churches of Scotland, psalmody has formed almost the entire music; while hymns—sometimes not of a very solemn or devotional character—predominate among the English dissenters. Some years ago, church music in Scotland had fallen to the lowest state of degradation; but efforts have lately been made, with some success, to raise its character. Even organs, which were proscribed by the early Scottish reformers, and have ever since been in disfavour, have begun to be introduced; and chanting has been admitted into some few Presbyterian churches.

Of sacred musical compositions not intended to form part of the service of the church, the most important is the *Oratorio* (q. v.), a composition either entirely dramatic, or combining the drama and epic, where the text is illustrative of some religious subject, and the music consists of recitatives, airs, part-songs, and choruses, accompanied by orchestra and organ.

SACRIFICE, one of the most important elements of divine worship, common to all nations of antiquity, and therefore traced by some to a primeval revelation. The powers of nature, palpable in their effects for good and evil, could not but inspire man, even in his rudest stage, with gratitude or fear towards the unseen being or beings by whom he conceived them to be actuated. The next and most natural step was the outward manifestation of these feelings by a token which bespoke either thankfulness or the wish of conciliation on the part of the donor. The supreme numina being conceived merely as superior men with exaggerated human wants, the means taken to gratify them were adapted to this conception. The best and richest fruits of the soil, the finest and most immaculate animals of the flock, were offered to the gods, that they might either partake of them bodily, or at least enjoy the sweet smell arising from the altar at which they were burned in their honour; and the deity was supposed emphatically to express its readiness to accept the offering by sending down the rain that was to consume the animal prepared. The more the divine favour was sought for some special purpose, the costlier and more precious became the gift; and nothing short of the most startling proofs of self-abnegation seemed, at times, to satisfy the devotion of man in his uncultivated state. From the simple and child-like notion of establishing a certain kindly and permanent relation between the visible powers and man, by the yielding up on the part of the latter a certain more or less precious portion of what the former had given him, there grew up such horrible monstrosities, that, in honour of humanity, we should feel inclined to doubt them, were they not so well attested, and did they not, to a certain extent, still prevail in our own days. Method and system took in hand that undeveloped wild-like instinct which touchingly offered the deity flowers, a blooming bough, a golden fruit; and

degraded it into mysticism and superstition; ending at last in the theory that the divine revenge was to be gratified, the divine vanity flattered, and the deity made as generally pleased as could be by holocausts of human beings, friends or foes—nay, the dearer the being to the offerer, the more the self-abnegation must become patent, and the more the god must smile upon the donor. The Moloch worship—the mother placing her babe in the arms of the monstrous idol, and seeing it slowly burned before her own eyes—seems well nigh to exhaust all the horrors of human ingenuity.

Turning first of all to those most ancient and hallowed records of humanity contained in the Old Testament, we find the custom of sacrifice almost on its first pages, and spoken of as a rite already established. Sacrifice is the cause of the first murder on record. Abraham is prevented by a voice from heaven from carrying out the slaughter of Isaac, into which he had been 'tempted' by Jehovah; all the patriarchs, in fact, sacrifice, either independently or in ratification of a covenant; and the exodus itself was brought to pass under the pretence of the people having to offer up their wonted sacrifice in the desert.

According to the highest ancient authorities, both Jewish and Christian—of whom we will only mention Maimonides and Ephraem Syrus—the Mosaic sacrifices were neither more nor less than a kind of divine concession to the sensual nature of an uncultivated people, full of Egyptian reminiscences on the one hand, and surrounded by Canaanitish modes of worship on the other. It was, as Ephraem Syrus says, only at a very late period that Moses, by the command of God, in whose eyes the rites of priests and sacrifices have but little value, prescribed these observances to his people, on account of their weakness and hardness of heart—lest they might despise a 'naked' religion, and attach themselves to false gods, whose magnificent and dazzling cultus surrounded them on all sides. In corroboration of this view, the prophets are appealed to, who never cease to inveigh against sacrifice as such, when, according to their view, the people were educated enough to do without this symbol and to worship God in truth and in spirit. (Compare Jeremiah vii. 22; I Samuel xv. 22; Psalms l. 8–10; li. 18, 19; Isaiah i. 11, &c.) But the institution being deemed necessary for the time, legislation had to circumscribe it rigorously, so as to make it as little hurtful as possible. Ceremonies contrary to morals and decency, such as were practised in the temples of Canaan, the abominations of phallic rites, the sacrifices of virginity, and, finally, the offering up of human beings, were punished with instant death by the Mosaic law.

How the principal modes of sacrificial offerings, such as they had naturally developed, nearly alike everywhere throughout antiquity, and as they had obtained in the pre-Mosaic times among the Hebrews, were adopted in the Mosaic legislation, and adapted to its exalted religious character, we can only indicate here in the briefest outlines. These pre-Mosaic sacrifices were chiefly of three kinds: first, the 'propitiatory,' i. e., an offering enjoyed by the deity in any form that would be grateful to him, conciliate him, procure his aid and blessing in times of need or for some special undertaking, and would further obtain his forgiveness, if something had been done unwittingly that might have offended him. This kind of sacrifice, whether bloody or unbloody (e. g., harvest sacrifice), appears to have been fully burned (*Olak*). The second kind partook more of the nature of sacrificial meals, in which both the divinity, the priest, the man who offered the sacrifice, together with his

SACRIFICE.

friends, took a part. It was a solemn and joyous oblation, expressing the thanks of the individual for some obtained favour, in which he wished others to join. Only the parts supposed to be the choicest were burned upon the altar; the priests received some other parts, and the rest formed the grateful sacrificial repast (*Sebach Shelamim*). The last was the expiatory sacrifice, intended as an equivalent for some deadly crime, which either was not punishable by the existing laws, or which had been committed under circumstances that would not have warranted capital punishment. From the notion, that the blood of the murderer was necessary for 'the cleansing of the blood that is shed' (cf. Numb. xxxv. 33), sprang that other, it would appear, that there was expiatory power in the blood itself; and that further, the blood of an animal was a fitting representative of, and equivalent for that of the human criminal, who had only to transfer, as it were, his sin to the animal by placing his hand upon its head, and perhaps using a formula to that effect. The flesh of this animal was not deemed fit for the altar, and was probably burned at some other place (*Chattath, Asham*). The Mosaic legislation finding such general elements ready, proceeded eclectically. They were partly embodied with considerable alterations, and partly rejected unconditionally. The anthropopathic idea of the 'agreeable smell,' as well as the notion of the expiatory power of the blood, were retained—the latter, however, with this modification, that the poor were allowed to use flour instead of meat for their sin-offerings. But the principal alterations introduced were the abolition of all polytheistic rites from the sacrificial service, of all the immoral, obscene, and horrible ceremonies connected with the heathen practice, and finally, the totally different definition and limits given to the 'sin-offering.' While formerly, everything could be expiated by a sacrifice, henceforth, only unpremeditated sin could by this means be effaced; while there was no expiation for any premeditated crime; the law simply took its course in that case.* Further, many things till then permitted were prohibited, and thus fell under the denomination of 'sin'; and certain purifications—beneficial in themselves—were connected with the expiatory sacrifice, and their practice thus strongly enforced. This extension of the notion of 'sin-offering' rendered a subdivision of it necessary; the more venial, or rather unconscious transgressions, were treated differently from the less pardonable ones in the ritual.

While Mosaism thus seemed, in its adoption of the rite of sacrifice, to make one of the most important concessions to heathenism, this very rite was, on the other hand, calculated to attract the early Hebrews to the worship of Jehovah, and at the same time to wean them from the horrible practices connected with it among the Canaanites. But more; during the primary stages of the people's existence, it served, by inculcating observances which were at once hygienic and symbolic of purity and holiness, as a powerful means of education and culture. In order, however, that these beneficial consequences premeditated by the lawgiver should not be frustrated, it was necessary, above all things, to keep the strictest possible supervision over it; and this was best established by the legal transfer of the whole sacrificial service to one single spot of

the land, finally, the temple at Jerusalem. The 'heights' and their 'heathen abominations' were thus theoretically abolished, and the sacrifice thus only at one central point could in reality be said to be offered up for the 'whole community of Israel,' went far, under these circumstances, to awaken and to strengthen a common spirit of nationality and patriotism, which was further aided by the periodical pilgrimages. For the details of the Jewish sacrifices, we must refer to the Old Testament generally.

As to the different opinions held by Jewish and Christian authorities regarding sacrifice, when offered up in expiation of a sin either by the people or by individuals, suffice it here to mention that they are divided between the various notions of the offering being either a present to the offended deity, a civil punishment (*mulct*), or, finally, a kind of substitute for the sinners themselves. The latter is the view held by many of the rabbinical writers as well as church Fathers. The life (Nepheah) of the animal or its blood (Lev. xvii. 11) was distinctly said to make 'the atonement for the soul.' This notion of a representative victim is one that belonged to the whole ancient world, and often finds its expression in the Old Testament. The sacrifice of the covenant (Jer. xxxiv. 18, &c.), the scapegoat (Lev. xvi. 21), and the like, are so many embodiments of this idea; which by Christian divines is held to have found its acme and final fulfilment in the sacrifice of God himself, as the 'Man Christ,' who united in himself the priest, the offerer, and the sacrifice. In fact, the whole institution of sacrifice is throughout the New Testament and the Father held to have been merely typical of this final act, by which the sin of man was expiated. See ATONEMENT, MASS.

The Jewish sacrifices, rejected already by the Essenes, ceased with the downfall of the Temple in Jerusalem; although the Samaritans, who claim to retain exclusively the Mosaic covenant, still continue this rite on Mount Gerizim on the Passover. The orthodox Jews, however, include in their prayers for the restoration of the visible sanctuary on Zion, also that of the restoration of the sacrifice 'in their order and proper rule,' 'of the priests: their service, and the Levites to their songs and hymns,' and each day, Sabbath, or Feast, the sacrifice incumbent upon it is mentioned in the prayers; and on fast-days, especially on the day of atonement, the diminution of bodily substance supposed to arise from the abstinence, the 'fat and blood' next, it is supplicated, be considered by God as tantamount for that of the sacrificial animals which, through their sins, the people are not now deemed worthy of offering up. The modern (extreme) party of reformed Jews, however, repudiate, together with the literal interpretation of the Messianic prophecies, also that notion of the sacrifices ever being restored again.

We can only very briefly touch upon the sacrificial customs among other nations of antiquity. The same feeling of dependence upon supreme, visible, but ever-present powers, engendered, as we said at the beginning, everywhere nearly the same expressions of awe, gratitude, and the like. The mode proffered differed, according to the degree of culture, the mode of life, and the products of the soil among the different peoples. No less was the significance attached to the gift different in proportion to the mental development of those who offered; at one time considered as a present, to be taken as sensually enjoyed, as it were, by the Deity, at others assumed a higher and purely symbolic aspect, as an expression of gratitude, love, reverence. In the same proportion, the gifts themselves varied, not only respecting their nature, but also

* One of the most characteristic exceptions, however, was that in favour of those who had denied the possession of some pledged article, or who had wilfully cheated or robbed their neighbours. If they were eager to make voluntary and ample restitution, 'the door of repentance was opened to them,' and they were allowed to make public expiation through sacrifice.

respecting their value. While Mongols and Tartars, Lapps and Negroes, most of the ancient nomad tribes in fact, generally sacrificed the milk and the uneatable parts of the animal only, its bones, horns, skin, &c.; the Greeks and Romans offered not unfrequently thousands of the choicest, most immaculate animals, and the sacrificial vessels were with them, as with the Hebrews, wrought of the most precious metals. Votive offerings—arms, spoil, garments, tools, locks, poems, &c.—customary in the better days of Rome and Greece; and the sacrifices of chastity on the part of maidens and women—chiefly the custom of Babylon, Phœnicia, Cyprus, &c., likewise fall under the denomination of sacrifice in its wider sense. Among the Indians, Bactrians, Medes, and Persians, the sacrifices consisted of fruits, libations, animals, and the like, and were of many degrees and numbers. Among the first-named, the study of the Vedas was reckoned as the first round in the sacrificial ladder. With the Persians (see GUXBRES, PARSEES), the priests at the Daruns sacrifice, instituted in honour of Zerdusht the lawgiver, eat small unleavened cakes, and drink Hom-juice, which is to represent the blood of the prophet. They also have sacrifices for the souls of the deceased. The Buddhists offer flowers and first-fruits only; their animal sacrifices are represented by small animal figures kneaded of dough, offered up on certain occasions. Of the 'classical' peoples and their sacrificial debauches, which followed the primeval frugality in their offerings no less than in their lives, we need not speak here, save as far as they, too, indulged in the rite of human sacrifice from their very earliest period to their decadence. Among the Greeks, the legendary tales of the daughters of Erechtheus, and of Iphigeneia in mythical times, the sanctuary of Zeus Laphystius at Halos and at Lyceæ, in Arcadia, the offering up of three Persians by Themistocles before the battle of Salamis, are tokens sufficiently indicative of the generality of the practice. Among the Romans, human sacrifices, in use during the Republic—either enthusiastic voluntary deeds of patriotism, or simply a kind of execution in punishment of a deadly sin—were prohibited in later times by the senate; but both Augustus and Sextus Pompeius committed wholesale murders by way of political sacrifice to the gods. That this abomination of slaughtering men in honour of God at stated periods, flourished to an awful extent among our northern ancestors—Scandinavians and Germans, as well as among Gauls and other Celts—need hardly be added. At Upsala, every ninth year, a great sacrifice of expiation was offered up, consisting of nine human beings and sixty-three animals. The Danes, in the same manner, held a sacred sacrifice every ninth year, of ninety-nine men, besides horses, dogs, cocks, and other domestic animals (see the EDDAS; Muller, *Sagenbibliothek*; Pertz, *Mon. Germ. Hist.*; *Script. passim*, &c.). The German tribes, even after their conversion to Christianity, continued to offer up their prisoners of war, as of yore, just as the Franks brought their sacrifices both to their ancient gods and to Christ. Any illness, danger, sickness—the slightest inducement, in fact, sufficed to move the Gauls towards a human holocaust, in the fashion of the worshippers of Baal and Moloch. At the death of a man, all his possessions, movable and immovable, including slaves, clients, wives, and all, were offered up to his manes. See SUTTEE. That the ancient Mexicans, the negroes, and other wild tribes, were highly proficient in this sort of wholesale slaughter, need hardly be added: the king of Dahomey's practices, and the fruitless remonstrances of our own government, are a too well-

known illustration of the firm hold this kind of murder in honour of the Deity has of the human mind. In conclusion, may we not consider the cruelties and massacres committed upon the Jews in the middle ages, in the name of Christ, as a last offspring of that Moloch or Baal worship which seems to be an instinct in the superstitious mind, whether Pagan or Christian?

SA'CRILEGE is not now a legal, but is a popular term used to denote the breaking into a place of worship, and stealing therefrom. In England, whoever breaks and enters any church, chapel, meeting-house, or other place of divine worship, and commits any felony therein; or whoever, being in such places, shall commit any felony therein, and break out of the same, is guilty of felony, and liable to penal servitude for life, or for not less than three years, or to imprisonment for a term not exceeding two years, with hard labour. The legal offence comes generally under the head of burglary or house-breaking. A less punishment applies to the offence when committed in dissenting chapels.—In Scotland, there is no increase of severity in the punishment, by reason of the sacred character of the things stolen.

SA'CRISTAN (Lat. *sacra*, sacred things), an official attached to a church, who is charged, under the priest or ruler of the church, with the care of the church, and of all its appurtenances. It is his duty to open and close the church, to take care of the sacred vestments and utensils, and to prepare what may be required for public service. In some Roman Catholic churches, the sacristan is a clerk in minor orders. The English name sexton is derived from this word.

SA'CRISTY, an apartment attached to a church, in which are kept the sacred objects used in the public worship, and in which the clergy and other functionaries who take part in the service assemble and prepare for the ceremonies on which they are about to enter. In many foreign churches, the sacristy is a spacious and costly building.

SACROBOSCO, JOANNES DE (Anglic, *John of Holywood*), was an English mathematician of the 13th c., entered the university of Paris in 1221, and afterwards became professor there. He died at Paris in 1256. S. was one of the first doctors of the middle ages who made use of the astronomical writings of the Arabians. His treatise, *De Sphæra Mundi*, is merely a paraphrase of a portion of Ptolemy's *Almagest*. No book enjoyed greater renown as a manual among the scholastics. First published in 1472, it passed through more than 20 editions—some even say 65—with as many commentaries. Other works of S. are *De Computo Ecclesiastico* and *De Algorithmo*, one of the first works on arithmetic in which the numerical notation of the Arabs is employed.

SA'CRUM, or OS SACRUM, is a triangular bone situated at the lower part of the vertebral column (of which it is a natural continuation), and wedged between the two innominate bones so as to form the keystone to the pelvic arch. It is readily seen to consist of five vertebrae with their bodies and processes, all consolidated into a single bone. Its anterior surface (as shewn in the figure) is concave, not only from above downwards, but also from side to side. The posterior surface is convex, and presents, in the middle vertical line, a crest, formed by the fusion of the spines of the vertebrae, of which the bone is composed. The last sacral vertebra has, however, no spine, and the termination of the vertebral canal is here very slightly protected.

Various reasons have been assigned for the peculiar name given from very olden times to

provisions of such a pass has always been esteemed a disgraceful breach of the laws of honour.

SAFED, a small town of Palestine, in the pashalic of Acre, and in the ancient province of Galilee, stands on a mountain 2500 feet high, twelve miles north of Tiberias. The inhabitants, about 5000 in number, are engaged in the manufacture of cloth and in dyeing, and the country in the vicinity is largely productive of wine and oil. It is an ardent wish of the Jews to die here, because they believe that the expected Messiah will make this place his capital. The Jews possess about thirty synagogues in the town, also a college for instruction in Hebrew and the Talmud. Prior to 1837, S. was a handsome town; but in that year it was partially destroyed by an earthquake, and 2000 Jews, 300 Mohammedans, and a number of Christians, were killed.

SAFES, FIREPROOF. The manufacture of iron safes for the preservation of money and valuable papers has become one of great importance. The foundation of the plan on which fire-proof safes are still constructed was laid by a Mr Richard Scott in 1801. Mr Thomas Milner in 1840 patented a fire-proof safe embodying the same principle, but with some improvements. In 1843 letters patent were granted to Messrs Tann for the use of a mixture of pounded alum and gypsum, previously heated and cooled, as a fire-resisting medium placed between two plates of iron, from three to six inches apart, which together form the wall of the safe. Milner's plan was to fill the jacket formed by the double-plated sides with sawdust, in which were packed a number of small tubes filled with an alkaline solution, and hermetically sealed, or crystals of alum or soda, containing from 40 to 60 per cent. of water of crystallisation. In case of fire, and the safe becoming heated, the tubes burst, or the crystals melt, and saturate the sawdust with water, which becomes steam, and passes into the inner chamber of the safe, and thus protects the contents, if inflammable, from fire for a considerable length of time. Fire-proof safes are still made on the same principle. Messrs Chubb are at present using a mixture of alum and a mineral substance they procure from abroad. These safes, in order to be effectual, must be made with very great care; and to make them secure against thieves, as well as fire, the locks must be of very superior construction.

SAFETY-CAGE. See MINING.

SAFETY-FUSE, a species of fuse invented by Messrs Bickford for use in the Cornish mines, and now generally employed in the chief mining districts, consists of a hollow cord of spun yarn or hemp, tarred on the outside to render it waterproof, and filled with tightly rammed gunpowder. This fuse ignites steadily at the rate of about two feet per minute, so that the time which elapses between the igniting of the fuse and the explosion of the powder in the chamber can be easily regulated by the length of the fuse. The use of this contrivance has contributed to prevent those accidents arising from premature explosions, which were formerly of very common occurrence in mines. The fuse-tube is sometimes made of gutta-percha.

SAFETY-LAMP. It has been long known that when marsh-gas or light carburetted hydrogen, which is frequently disengaged in large quantities from coal-mines, is mixed with seven or eight times its volume of atmospheric air, it becomes highly explosive, taking fire at the approach of a light, and burning with a pale blue flame. Moreover, this gas in exploding renders ten times its bulk of atmospheric air unfit for respiration, and the *choke-damp* thus produced is often as fatal to miners as

the primary explosion. With the view of discovering some means of preventing these dangerous results, Davy instituted those important observations on flame which led him to the invention of the safety-lamp. He found that when two vessels filled with a gaseous explosive mixture, are connected by a narrow tube, and the contents of one fired, the flame is not communicated to the other, provided the diameter of the tube, its length, and the conducting power for heat of its material, bear certain proportions to each other; the flame being extinguished by cooling, and its transmission rendered impossible. In this experiment, high conducting power and diminished diameter compensate for diminution in length; and to such an extent may this shortening of length be carried, that metallic gauze, which may be looked upon as a series of very short square tubes arranged side by side, completely arrests the passage of flame in explosive mixtures. The following are Davy's directions regarding the structure of his lamp: 'The apertures in the gauze should not be more than $\frac{1}{16}$ of an inch square. As the fire-damp is not influenced by ignited wire, the thickness of the wire is not of importance; but wire from $\frac{1}{16}$ th to $\frac{1}{8}$ th of an inch in diameter is the most convenient. Iron-wire and brass-wire gauze of the required degree of fineness, are made for sieves by all wire-workers but iron-

wire gauze is to be preferred: when of the proper degree of thickness, it can neither melt nor burn; and the coat of black rust which soon forms upon it superficially defends the interior from the action of the air. The cage or cylinder should be made of double joinings, the gauze being folded over so as to leave no apertures. When it is cylindrical, it should not be more than two inches in diameter; for in larger cylinders, the combustion of the fire-damp renders the top inconveniently hot, and a double top is always a proper precaution, fixed at the distance of half or three-quarters of an inch above the first top. The gauze cylinder should be fastened to the lamp by a screw of four or five turns, and fitted to the screw by a tight ring. All joinings should be Safety-Lamp made with hard solder; and the security depends upon the circumstance, that no aperture exists in the apparatus larger than in the wire gauze.' The cylinder is protected by three external, strong, upright wires, which meet at the top; and to their point of junction a ring is attached, by which the lamp is suspended. The oil is supplied to the interior by the pipe projecting from the right side of the figure, and the wick is trimmed by a wire bent at the upper end, and passed through the bottom of the lamp, so that the gauze need not be removed for this process. (The wire is here shewn in the figure.) When a lighted lamp of this kind is introduced into an explosive mixture of air and fire-damp, the flame is seen gradually to enlarge as the proportion of light carburetted hydrogen increases, until at length it fills the entire gauze cylinder. Whenever this pale enlarged flame is seen, the miners should depart to a place of safety, for although no explosion can occur while the gauze is sound, yet at that high temperature the metal becomes rapidly oxidised, and might easily break; and a single aperture of sufficient size would then occasion a destructive explosion. In a strong current of air, the heated gas may be blown through the apertures of the

gauze before its temperature is sufficiently reduced to prevent an explosion; but such a contingency may be guarded against by placing a screen between the draught and the lamp. It was in the year 1815 that Sir Humphry Davy presented his first communication to the Royal Society respecting his discovery of the safety-lamp; and at the meeting held on January 11, 1816, the lamp was exhibited. Sir Humphry Davy's claim as an original discoverer was immediately challenged by various persons, amongst whom may be especially noticed the late Dr Reid Clanny of Newcastle, and the great engineer George Stephenson. Clanny's safety-lamp (which is described in the *Philosophical Transactions* for 1813) was based on the principle of forcing in air through water by bellows; but the machine was tedious and complicated, and required a boy to work it; moreover, he had been anticipated by Humboldt in 1796 (Weld's *History of the Royal Society*, vol. ii. p. 288, note). Notwithstanding a report of the Royal Society, dated November 20, 1817, and signed by Joseph Banks, P.R.S., William Thomas Brande, Charles Hatchett, and William Hyde Wollaston, which is totally adverse to Stephenson's claims, there is undoubted evidence that, during the very months Davy was at work on the experiments which led to his invention, Stephenson's (familiarily called the *Geordy*) lamp was actually in use at the Killingworth mines. In its general principle it was the same as Davy's, the main difference being that the Stephenson lamp had a glass cylinder inside the wire-gauze cylinder, and that inside the top of the glass-cylinder was a perforated metallic chimney; the air being supplied through a triple circle of small holes in the bottom. On the subject of this controversy, the reader is referred to Smiles's *Life of George Stephenson*. Our limited space prevents us from noticing the various reports on 'Accidents in Mines' that have been published by different committees of the Houses of Lords and Commons, or from entering into any details regarding the modified forms of safety-lamps that have been since introduced. The best of these modifications are described in the article LAMP, SMITH, in the 'Arts and Sciences Division' of *The English Cyclopædia*, from which we extract the following paragraph: 'Amidst much diversity of opinion concerning the relative merits of these various kinds of safety-lamp, there is a pretty general agreement that the gauze cylinder should be accompanied by one of glass, to resist the action of strong currents of air; and that the glass without the gauze is not sufficiently protected to must fracture.'

Closely connected in its objects with the safety-lamp is a most ingenious invention which was recently patented by Mr Ansell of her Majesty's Mint. Its object is to determine, by a simple application of the law of osmotic force, the presence of carburetted hydrogen in coal-mines; and the apparatus which Mr Ansell has devised promises to indicate the accumulation of fire-damp before it becomes dangerous, and either to give the miner notice of it, or to convey that notice to the surface by its connection with some simple electro-telegraphic arrangement. Mr Ansell gives two or three forms to his apparatus, of which the following is the most simple: A thin india-rubber ball is filled with atmospheric air, and is placed on a stand under a lever which slightly presses its upper surface. This lever is connected with a spring, which it liberates when, from any cause, the lever is raised; and the liberation of the spring sets a bell in vibration. If this trap for the discovery of fire-damp is set where that gas is present to any material extent, the noxious gas enters the ball by

virtue of osmose, causes it to swell, and when the swelling has attained a certain point, the warning bell rings.

Attempts have at various times been made to use electricity as an illuminating agent in dangerous coal-mines, but until the recent discovery of Ruhmkorff's induction coil, none of them have been successful. MM. Dumas and Benoit have now constructed an electric lamp founded on the advantages presented by Ruhmkorff's machine and Geiseler's vacuum-tube; and they have made some trials with the lamp in several of the French collieries, which are stated to be successful; and M. Alphonso Dumas exhibited it at a meeting of the North of England Institute of Mines on February 4, 1865. For a description of the lamp, which, from its delicacy and weight (about 14 lbs.), can never supersede the ordinary safety-lamp, we must refer to the *Quarterly Journal of Science*, No. 6, April 1865, p. 387. Under circumstances of extreme danger, this lamp may, however, be very useful, as an explosive atmosphere may be entered in safety, with the advantage of a sufficient light for the purpose of examination. The light is by no means brilliant, but presents the character of a rich phosphorescent glow.

SAFETY-VALVE is a circular valve placed on an opening in the top of a steam-boiler, and kept in its place either by means of weights piled above it, by a lever of the second kind, with a weight capable of sliding along the arm, or by a lever and spring. In stationary engines, one valve is frequently found sufficient, and the pressure on the valve is produced in the first or second of the methods indicated above. In locomotive engines, on the contrary, there are always two loaded valves: one, called the *lock-up valve*, from its being out of the engineman's reach and control, is placed well forward on the top of the boiler, and kept down by weights; the other, on the hinder part of the top of the boiler, is for safety subjected to a less pressure than the lock-up valve, and is acted on by a lever and spring. The term 'safety-valve' is particularly appropriate to this invention; for whenever the tension of the steam rises above a certain amount (= the weight in pounds with which the valve is held down divided by the area in inches of the undersurface exposed to the steam), the valve is forced upwards by the superior pressure beneath, steam escapes, and the pressure on the boiler being thus relieved, the valve sinks to its place. The only precaution necessary is to be sure that the valves are not too heavily loaded or fastened; and wilful indifference, or disregard of this caution, has, especially in the case of American river-steamers, been productive of the most serious casualties.

SA'FFI, AZAFFI, or ASFI, a seaport of Northern Africa, in the kingdom of Morocco, and 107 miles west-north-west of the city of that name. It is surrounded by waste and desert land; and its inhabitants, about 12,000 in number, of whom 3000 are Jews, are said to be the wildest, greediest, and most fanatical of the kingdom. It was at one time the chief seat of the trade with Europe, and though it has declined with the rise of Mogadore, it still exports silk, wool, leather, gum, and goat-skins.

SAFFLOWER (*Carthamus tinctorius*), a plant of the natural order *Compositæ*, allied to Thistles (q.v.), but distinguished by its heads of flowers having only hermaphrodite florets, and the fruit having four ribs, and no pappus. It is an annual, 2-4 feet high, branching towards the top; flowers dark orange, or vermilion. It is a native of the East Indies, from which it was probably introduced

SAFFRON—SAGE.

in a remote age into Egypt and the Levant, where it is now naturalised. It is extensively cultivated in France, and the more southern parts of Europe, and even in some parts of South America, chiefly on account of the corollas of the florets, which are used in dyeing yellow and red. In France, it is drilled or sown broadcast in the beginning of May. The plants are thinned to five or six inches apart; and the flowers are picked by the hand in dry weather, and very carefully dried on a kiln, under pressure, and are thus formed into small round cakes, in which state S. appears in the market. The S. of Persia is generally esteemed the best; but India yields the chief part of that imported into Britain. From its resemblance to saffron, S. is sometimes called *Bastard Saffron*, and it is used to adulterate saffron. The yellow colouring matter of S. is a kind of extractive. The red colouring matter is Carthamine (q. v.). The colouring matter of Rouge (q. v.) is derived from Safflower.

The seeds of S. are bitter and very oily. They are greedily eaten by parrots and many other birds. They are sometimes used as a purgative. The oil which they contain is employed in the East Indies in cases of rheumatism and paralysis.

SAFFRON, a colouring material, consisting of the dried stigmas of the common yellow crocus, so abundant in our gardens in early spring. It was introduced into Europe from Asia Minor, and is largely cultivated in several countries, but chiefly in Spain. In England, the crocus was unknown until 1339, when it was introduced from the East by a pilgrim; and in 1582 it was extensively cultivated for yielding S., especially in Essex, at the place now called, in consequence, Saffron-Walden. Its cultivation in Britain has almost entirely ceased, and the S. used is imported. S. is not only valuable as a colouring material, but has from very early ages had a great medicinal reputation. Homer mentions it, and Solomon associates it with spikenard and other precious drugs and spices. A large portion of the supply in ancient times was yielded by Cashmere, where it is still extensively cultivated. In addition to its other properties, it is often used as a perfume, and in flavouring as well as colouring confectionary and other articles of food. These latter are now its chief uses in Britain, where its medicinal value has long been declining. The colour yielded by S. is a bright golden yellow, and is due to a peculiar principle called *Polychroite*. Its great solubility in water prevents its being used as a dye for fabrics; but its agreeable flavour, and the absence of all injurious qualities, render it of great service in colouring articles of food.

The *S. Crocus* (*Crocus sativus*; see **CROCUS**) differs from most of the species of that genus in flowering in autumn, not in spring. It has large deep purple or violet flowers, with the throat bearded, and the long drooping trifid stigma much protruded from the tube of the perianth. The stigmas are the only valuable part of the plant.

In its cultivation, the corms are planted in the beginning of summer in rows six inches apart, and three inches from bulb to bulb; the most suitable soil being a sandy loam, very thoroughly tilled. The stigmas are gathered by women and children, and are spread out on cloth or paper, and dried in the sun, or in kilns or drying-houses. The produce of an acre of S. is about 5 pounds the first year, and 24 pounds the second and third year, after which the plantation must be renewed. But an ounce of S. sells for at least £2.

SAFFRON-WALDEN, a market-town and municipal borough of England, in the county of

Essex, 24 miles north-north-west of Chelmsford. The church is an elegant specimen of late Perpendicular. The free grammar-school has an income of £60 a year. The chief trade is in barley, malt, and cattle. Pop. (1871) 5718.

SA'GA, an old Norse word, used to denote a tale which, originally dependent on, and gradually elaborated by, oral tradition, had at last acquired a definite form in written literature. Such sagas (Norse *Sögur*), along with poetical and legislative writings, constitute the chief part of the old Norwegian-Icelandic literature. They have been divided into historical and legendary. The latter embrace partly stories universally current about heroes of the Teutonic race (e.g., the *Völsunga-Saga*), and partly stories peculiar to the Norse or Scandinavian peoples (e.g., the *Friðjofs-Saga*), while the former handle the events and personages of Norwegian and Icelandic history from the 9th to the 13th c., in numerous biographies and family records. To Danish history belong the *Knytlunga-Saga* and *Jomsvinginga-Saga*; to Swedish, the *Ingvars-Saga*; to Russian, the *Eymunds-Saga*. The Farø Islanders and the Orcadians have also their own sagas. After the middle of the 14th c., when the motley literature of the church began to exercise an influence, tales were translated from foreign languages into Norse, e.g., the story of *Barlaam and Josephat* (q. v.), which also received the name of sagas. Bishop P. E. Müller, in his *Sagabibliothek* (Copenh. 1817—1820), was the first who subjected the whole subject of saga-literature to a critical treatment. Since his time, collectors both of the historical and legendary sagas, with critical apparatus more or less complete, have appeared in all the countries of the north.—The German *Sage* is the same word, and expresses fundamentally the same idea as the Norse *saga*. The difference is this, that the Germans do not restrict its application to the legendary or traditional literature of their own country, but extend it to that of others.

SA'GAN, a town of Prussian Silesia, 48 miles north-west of Liegnitz, on the Bober, and on the Hannsdorf and Glogau Railway. Pop. (1872) 10,471, who manufacture cotton and woollen cloths, and paper, and trade in yarn, cattle, and corn. In the manufacture of woollen cloths alone, 1600 men are employed.

SAGE (*Salvia*), a genus of plants of the natural order *Labiata*, and containing many species, bracteose and half-shrubby. There are only two perfect stamens, the filaments of which bear at their summit a cross thread—the much elongated connective—fastened by a joint, and having one cell of the anther at the upper end, and the other but imperfect cell at the other end. The seeds of many of the species, when steeped in water, become covered with a mucilaginous slime, like quince-seeds.—COMMON S., or GARDEN S. (*S. officinalis*) grows on sunny mountain slopes and rocks in the south of Europe, and has long been in general cultivation in gardens. It is a half-shrubby plant, seldom more than two feet high, with ovate-oblong or lanceolate, finely notched, curiously wrinkled, whitish-gray leaves, and racemes of purplish blue, rarely white or red flowers. The whole plant has a peculiar, strong, penetrating aromatic smell, somewhat resembling that of camphor, and a bitter, aromatic, somewhat astringent taste. It contains much essential oil (*Oil of S.*), which has been sometimes used in liniments for rheumatism. *S. leucom* are much used in flavouring dishes, and in marries, &c. The leaves and young shoots are used in astringent tonic gargles. *S. tea*, made of the dried

SAGHALIEN—SAHARA.

leaves and shoots, is a popular astringent and tonic. It grows best in a dry soil, and is easily propagated by slips or cuttings.—CLARY (q. v.) is a species of sage.—MEADOW CLARY, or MEADOW SAGE (*S. pratensis*), is a common ornament of meadows and borders of fields in most parts of the continent of Europe, and in the south of England. It has bluish purple flowers. It is sometimes fraudulently put into beer, to make it more intoxicating.—THE APPLE-BEARING S. (*S. pomifera*) is a native of the south of Europe and of the East, remarkable for its very large reddish or purple bracts, and for the large gall-nuts which grow on its branches, as on the leaves of the oak, and which are known as *S. Apples*, have an agreeable aromatic taste, and are brought to market and eaten.—Some of the species of *Salvia* have very beautiful flowers, and are prized ornaments of gardens and greenhouses.

SAGHALI'EN, spelled in all Russian accounts Sakhalin (q. v.).

SAGINAW BAY, an arm of Lake Huron, extends south-west, and forms an important indentation of the shore of Michigan State, U.S. It is 60 miles long by 30 wide, with several fine harbours and picturesque islands. The water, like that of the whole lake, is of wonderful clearness and purity. The bay is named from the river Saginaw which falls into it.

SAGO is the starch produced by several species of palms, prepared in a peculiar manner. The species from which it is chiefly prepared are *Sagus lris*, *S. genuina*, and *Saguerus saccharifer*, in the Indian Archipelago; *Caryota urens*, in Assam; *Phoenix farinifera*, on the Coromandel coast; and the Talipot Palm (*Corypha umbraculifera*), in Ceylon. Several other species are occasionally used; and there is some reason to believe that some plants of the genus *Cycas* (natural order *Cycadaceae*) also yield sago. It is in all cases produced from the large mass of pith which fills the interior of the stems, therefore the trees require to be cut down. The stems are cut into lengths, split open, and the pith dug out, cut small, placed in a trough, and worked with clean water, to wash out the fecula; this makes the water white and turbid, and it is then run off into another vessel. Fresh washings of the pith take place, until it ceases to yield any starch. The water of the separate washings being all added together, is allowed to settle, and the starch is soon deposited; the clear supernatant water is then run off, and the deposit dried. This is the ordinary *Sago Flour* of commerce, of which large quantities are now imported for use as starch in the calico and other manufactures. When prepared for food, it is either in the state called *Pearl Sago*, or *Granulated*. The former is in little spherical grains of a pearly-white lustre, varying in size from that of a poppy-seed to a grain of millet. Granulated sago is also in round grains, but of a larger size, sometimes nearly as large as a pea. There are several varieties, differing much in colour—some quite white, others having the peculiar reddish-brown of radish-seed, which they strikingly resemble in appearance. One kind of granulated sago from India has lately been introduced into our shops under the erroneous name of Tapioca, from its having been called by the French *Sagoutapioca*.

The exact method employed by the Malays in pearlying and granulating their sago, is not known to Europeans; but there are strong reasons to believe that heat is employed, because the starch is partially transformed into gum. It is not entirely soluble in hot water, like ordinary starch, hence it can be employed in making puddings, &c., and in this way

forms a valuable article of food, being cheap, light, nutritious, and easy of digestion. The countries whence our supplies of sago are mainly obtained are Borneo, Singapore, India, and Ceylon. The amount annually imported into Britain is upwards of 8000 tons, and is valued at about £127,000.

SAGOU'IN (*Callithrix* or *Saguinus*), a genus of American monkeys, having a long but not prehensile tail, a small and rounded head, short muzzle, and large ears. They are of small size, and remarkably active and graceful in their movements. They are sometimes called *Squirrel Monkeys*. They are of very gentle disposition, and when tamed, become strongly attached to their masters. Both body and tail are covered with beautiful fur. The SIAMIRI or TEE-TEE (*C. sciureus*), a native of Brazil and Guiana, is one of the best known species.

SAGU'NTUM, a wealthy and warlike town of ancient Spain, in Hispania Tarraconensis, stood on an eminence near the mouth of the Pallantias (modern Palancia). Its site is now occupied by the town of Murviedro (q. v.). Founded (according to Strabo) by Greeks from Zacynthus, it became at an early period celebrated for its commerce, and attained to great wealth. But it owes its historical vitality to the circumstance of its siege and destruction by the Carthaginians, under Hannibal, in 218 B.C. Having withstood the siege for the greater part of a year, against an army amounting to about 150,000 men, led by a general of consummate ability and indomitable resolution, the Saguntines, now most severely pressed by famine, concluded, with an act of heroic defiance and self-sacrifice, a resistance that had been characterised by the most brilliant valour. Heaping their valuable effects into one vast pile, and placing their women and children around it, the men issued forth for the last time against the enemy; and the women, setting fire to the pile they had prepared, cast themselves upon it, with their children, and found in flames the fate their husbands met in battle. The destruction of S. directly led to the second Punic war.

SAHARA. The immense tract of country to which this name is commonly given, has already been described under the heading AFRICA (q. v.). But the term Sahara is more correctly applied to a region of much more limited extent. The natives divide Africa north of the line into three portions—the Tell, the Sahara, and the Desert. The Tell extends from the Mediterranean to the Atlas Mountains; the Sahara, from the Atlas to the southern region where all regular supply of water fails; and the Desert, from the southern, and not very clearly-defined frontier of the Sahara, southward almost to the water-shed of the Niger, comprising a district salt and arid, inhospitable to man and beast, although the camel may even here snatch a scanty subsistence. As to physical geography, the S. may be subdivided into the following districts—1. The Hauts Plateaux, or Steppes, a series of high levels skirting the base of the Atlas Mountains. 2. The land of the Dayats or waterless oases, stretching south to the high lands on the south bank of the Wed Mzi or Djidi. 3. The region of the southern oases, to the south of the former, and extending south till it loses itself in the Desert. The principal feature of the S. is the Wed Mzi, which rises in the Djebel Amour, and after an east, north-east, and finally south-east course, falls into the Chott Mel'hir. Throughout almost the whole of its course, which is about 400 miles long, it flows under ground. Its waters seem to rest on a bed of hard limestone from 30 to 60 feet below the surface.—Tristram's *Great Sahara* (John Murray, Lond. 1860).

SAHIB—SAIL.

SAHIB (an Arabic word meaning a companion, a master, a lord) is, in Hindustani, the usual designation and address of a respectable European, equivalent to Mister, Sir, &c. Hence, *Sahib* is the term for Lady, Madam. In Bengali and Mahrati, the word assumes the form *Sahab*.

SAIDA. See **SIDON**.

SAIGA. See **ANTELOPE**.

SAIGON, one of the finest river-ports in Asia, the capital of the French possessions in Lower Cochin China, stands on a small river of the same name, about 35 miles from the Chinese Sea. The city is fortified, and its value as a strategical position is unquestionable. By land it is defended from attack by many miles of jungle and swamp, and the approach from the sea on the south, by the fine river Donnai, could easily be rendered impassable to the strongest fleet. The entrance to the Donnai is at Cape St Jacques, and its winding course to S., through a rich level country, is from 50 to 60 miles in length, and might be defended by fortifications at every point. It is of easy navigation, and is of sufficient depth to allow vessels of the heaviest burden to sail close to its banks under the overhanging foliage. The breadth of the river from S. to the sea varies little, but it is never narrower than the Thames at London. It is joined on both sides by many large affluents, and it is the main channel of a river-system that covers the whole country to the south of the capital with a network of water-courses. The city of S. is fortified, and is defended by a permanent force of several large ships of war and a garrison of 10,000 men. At the beginning of the year 1865, the law of conscription, by which one man in seven is chosen from among the natives for military service, was already in force. S. consists of two parts, the Chinese town, four miles inland, filled with an active population busily engaged in trade; and the European, or fortified town on the banks of the Saigon. The latter, with its fleet of vessels riding at anchor in mid-stream, is already of considerable size. Good roads have been constructed for many miles around, and there are barracks, hospitals, official residences, and other buildings for public purposes. The soil, only about one-fourth of which is under cultivation, is abundantly fertile, and is admirably suited to the production of cotton, sugar, indigo, and tobacco, besides rice, which is at present the principal, and almost the only, exported product. Its forests contain magnificent timber, and abound in woods rich in dyes. Many handsome public buildings have been erected. There is a naval yard and arsenal, and ship-building is carried on. Pop. estimated at 180,000.

S., together with the territory of which it is the capital, was taken by the French in 1860. Treaties of peace and commerce have been concluded with the Anamite government, from which the colonial government derives great advantages. These treaties, signed 15th July 1864, provide that the protectorate of the six provinces of Lower Cochin-China shall remain in the hands of France; that three important ports on the coast of Anam shall be opened; and that a space of nine kilometres on the shore of each port shall be conceded to the French for the establishment of factories; that French merchants and missionaries shall be allowed to traverse the kingdom of Anam without hindrance, and that an indemnity of 100 millions of francs shall be paid. By these treaties the French still protect, though they do not formally at least possess the six provinces of Cochin-China, but they retain vast tracts of territory at S., at Cape St Jacques, and at Mytho, and remain masters of the rivers Saigon and Cambodia.

SAIL. A sail is an expanse of canvas, matting, or other strong material, on which the wind may exert its force and propel the vessel. A sail is extended by means of a mast or yard, or both. It may be of various shapes, and of any size, according to the carrying power of the vessel. A vessel of shallow draught or of narrow beam can bear comparatively little sail; while a vessel of proportionately deep draught and heavily ballasted—as a

Fig. 1.

yacht—or a vessel of great breadth of beam, can carry sail of great area. A sail acts with the greatest power when the wind is directly astern, as in fig. 1; but it can be applied, though with less strength, when on either beam. The action of the wind on an oblique sail is a good example of the resolution of forces. See **COMPOSITION AND RESOLUTION OF FORCES**, &c. Let TD, fig. 2, be a ship, PAS its sail, WA the direction of the wind, and let the length of WA represent the pressure of the wind on the sail. WA can be resolved into AB perpendicular to the sail, and BW parallel to it, the latter of which has no effect in pressing on the sail; therefore AB is the effective pressure on the sail. Were the vessel round, it would move in the direction BA. Let BA be resolved into CA

Fig. 2.

and BC, the former, CA, acting in the direction of the keel or length of the vessel, or in the direction CAD, and the latter perpendicular to it, or in the direction of the breadth. The former pressure, CA, is the only pressure that moves the vessel forward; the other, BC, makes it move sideways. From the form of the vessel, however, this latter force, BC, produces comparatively little lateral motion; any that it does occasion is called *leeway*. It results, therefore, that with the wind exerting an oblique pressure, the actual progress will be to the power of the wind only as CA to WA.

In the East and the Mediterranean, sails are frequently made of strong matting; but among northern nations, and for ocean navigation, very strong cloth, or canvas, called *sailcloth*, is usually resorted to. It is woven narrow; and the many breadths in the sail are joined by carefully made double seams.

Sails are nearly always either triangular or quadrilateral, but not necessarily equiangular. The

Fig. 3.

a, head; b, leech; c, foot; d, clew; e, earrings; f, drive; g, fore-leech; h, after-leech; i, sheet.

commoner forms are shewn in fig. 3. To give greater strength, a strong rope or cord is sewn into

SAIL—SAILINGS.

the outer edge all round the sail; this rope has eyes in it, to which the various ropes employed in connection with the sail are fastened. The top of a sail is its *head*; the bottom, its *foot*; and the sides are *leeches*; the upper corners are termed *ear-rings*; the lower corners of a square sail, and the after lower corner of other sails, *clews*; the front lower corner of a fore-and-aft sail is the *tack*. The ropes from the lower corners, used in tightening the sail against the wind, are the *sheets*.

The sails of a ship are either 'square' or 'fore-and-aft.' The square-sails—beginning from below—are, the *course*, the *topsail*, the *topgallant-sail*, the *royal*, and, though very rarely used, the *sky-scraper*. Each has the name of the mast on which

it is set prefixed, as 'fore-topsail,' 'main-royal,' &c. The square-sails are made fast by their heads to yards, the foot being drawn to the extremity of the yard below. Fore-and-aft sails are the *spanker* or *driver*, extended by the gaff at its head, boom at its foot, and mast on its fore-leech; the *staysails*, which are suspended by rings to the stays, and the *Jibs* (q. v.). In a three-masted vessel, the sails of most importance are the main-course, the spanker, the topsails, the fore-staysail, and the jibs, which can usually be all distended to the full without taking wind from each other. In very light winds, when every breath is of consequence, the area of the sails is increased by setting the *studding-sails*, which are oblong sails set on each side of the

Fig. 4.

square-sails, on short booms run out beyond the yards of the latter. Fig. 4 represents a square-rigged ship with the whole of her canvas shewn.

In small craft and boats, the most common sail is a lug-sail (see LUGGER), which is a small square-sail, occasionally supplemented by a shoulder-of-mutton (triangular) sail on a shorter mast at the stern. Cutters or sloops carry a large spanker, with a topsail of similar shape, and jibs; some having the power of setting a large course when the wind is astern; but it is obvious that the course and spanker cannot be used together. A schooner uses the same sails as a cutter, except that, in one form, she carries a square topsail and topgallant-sail on the foremast.

Sails are furnished with rows of short ropes for the purpose of *reefing* them, when their area is too large for the wind. The effect of a sail is increased

by wetting it, as the pores of the canvas close more tightly through the swelling of the hemp.

SAILCLOTH, a very strong fabric, woven generally with linen yarn, but in America it has been made wholly of cotton; and in this country, under Armitage's patent, of cotton and linen mixed. Hair—such as of the ox, horse, and deer—has also been used, under Taylor's patent, in 1832, but without success. Linen and hempen cloths are those generally used in all parts of Europe.

SAILINGS, the technical name in Navigation for the various modes of determining the amount or direction of a ship's motion, or her position after having sailed a given distance, in a given direction. The direction of a ship's motion is her *course*, and is expressed in terms of the angle between the line of direction and the meridian; the length of her

path is the *distance*; the distance in nautical miles, made good to the east or west, is the *departure*, and is measured along a parallel; the *difference of latitude* is an arc of the meridian intercepted by the parallels, one of which passes through the place sailed from, the other through the place sailed to; and the *difference of longitude* is an arc of the equator intercepted by meridians through the same two places. It will at once be seen that if a ship sails along a meridian, the difference of latitude becomes the course, and there is no departure or difference of longitude; and that if it sails along a parallel the departure will be the same as the distance, and there will be no difference of latitude. The two general questions which present themselves to the navigator for solution, are—1. Given the course and distance from one place in given latitude and longitude to another place, find the latitude and longitude of the other; and 2. Given the latitude and longitude of two places, find the course and distance from the one to the other. The simplest way in which such problems can be solved is by the method known as *plane sailing*, a method, however, which is only roughly approximate, assuming, as it does, that the surface of the sea is a plane; it is consequently applicable only to short distances and low latitudes where the meridians are nearly parallel.

According to 'plane sailing,' the elements of a ship's path are represented by a right-angled plane triangle, as ABC (fig.), where AB is the distance, the angle BAC the course, AC the difference of latitude (AC being a portion of a meridian, and BC of a parallel of latitude), and BC the departure. The two problems given above are in this method merely simple cases of the resolution of a right-angled plane triangle (see TRIGONOMETRY), for if the course and distance are given, the *diff. of lat.* = distance \times cos. of course, and *dep.* = dist. \times sin. of course; while the idea of *diff. of long.*, as distinct from *dep.*, is quite inadmissible, since the method presupposes that the ship is sailing on an absolutely flat plain. If the ship does not stand on one course, but changes from time to time, the calculation of her final position may be effected, either by the previous method, repeated for each change of course, or more conveniently, by the method of *traverse sailing*. This method consists in the resolution of a ship's course and distance into two courses and distances, the courses being in the direction of some of the four cardinal points of the compass; thus, a ship which has sailed S.-W.-by-S. for 24 miles, has made 20 miles of *southing*, and 13.3 miles of *westing*. The *traverse table* has consequently six columns, the first containing the courses; the second, the corresponding distances; while the third and fourth contain the difference of latitude for each course, which, if N. is put in one column, and if S. into the other; the fifth and sixth columns, marked respectively E. and W., contain in a similar manner the departure for each course. When the table has been made out for the various courses and distances, the columns of *diff. of lat.* and departure are summed up, and the difference between the third and fourth, and between the fifth and sixth columns, gives the *diff. of lat.* and departure between the place sailed from and the place arrived at, from which the course and distance made good can be calculated as before. When a current interferes in any way, either by accelerating or retarding the ship's motion, its effect is estimated as in *traverse sailing*, as if it were one course and distance, the *set* of the current being the course, and

its *drift*, i. e., its rate per hour multiplied by the number of hours it has affected the ship, the distance.

Parallel Sailing may be employed when a ship sails between two places, on the same parallel of latitude, in which case, if her head be kept accurately and constantly in an east or west direction, she will describe an arc of the parallel between the two places. As in this sailing the departure is the same arc of the parallel that the difference of longitude is of the equator, the *dep.* (which is now the *distance*) = *diff. of long.* \times cos. of lat. The other elements are found as in plane sailing.

Middle Latitude Sailing is the application of the principle of parallel sailing to the case in which the ship's course is not perpendicular but oblique to the meridian; it is merely an approximate method, coming very close to a true estimate in low latitudes for any course, and in all latitudes for a course nearly E. and W. (i. e., one in which the distance is large as compared with the difference of latitude) but erring widely under other circumstances, these errors may be diminished as much as we please by dividing the distance into portions, and calculating the *diff. of long.* for each. The object of this sailing is to deduce the *diff. of long.* from the *dep.*, and *vice versa*, on the supposition, that the whole departure has been made good along the parallel of latitude which is equidistant from each extremity of the course, a method which, at first sight, would seem to give a correct result, and would do so if the parallels of latitude increased uniformly, which they do not. The *dep.*, when laid off along the parallel of middle latitude, always gives the *diff. of long.* small, and hence the limitations above noted. When the latitudes are of the same name, the middle latitude is half their sum; but when of contrary names, it is better to find the *diff. of long.* for the portion on each side of the equator separately, the two middle latitudes being respectively half the latitude of the place sailed from, and half that of the place sailed to. The formulas are the same as for parallel sailing and plane sailing.

Mercator's Sailing is a perfect method of obtaining the same result as is found approximately by middle latitude sailing, but in the former case the *diff. of long.* is found from the departure, while in the method, the difference of latitude is employed for the same purpose. A table of meridional parts, as it is called, is necessary; this table shows the number of minutes in Mercator's projection (see MAP) corresponding to each degree and minute of latitude up to 78°, and is employed as follows. The latitude sailed from, and that reached, being known or found, the meridional parts for each are obtained, and their difference, if the latitudes are of the same name, or sum if of opposite names, gives the *diff. of lat.* We have then a right-angled triangle, with the *diff. of lat.* and *diff. of long.* forming the two smaller sides, and the vertical angle representing the course, whence *diff. of long.* = *diff. of lat.* \times tan. of course. This sailing is the one generally employed by navigators, but is inferior in practice to middle-latitude sailing, in the case noticed under that head, for though it be a perfect method, and the other merely an approximate method, yet a small error in the course (if large), or in the *diff. of lat.*, becomes greatly magnified in the *diff. of long.*, while in the case of the latter, a considerable error in departure is hardly magnified, and a large error in the course (if nearly E. and W.) becomes imperceptible in the *diff. of long.* It is, however, better to work the problem according to both methods, and then estimate the true result as nearly as possible.

Great Circle Sailing (q. v.), the most perfect of all methods for finding a ship's course, is separately noticed. See also SPHEROGRAPH.

The obstacles that interfere with the correctness of the mariner's calculations are chiefly those which affect his data, the course and distance, the more important being the magnetic deviation of the compass produced by the attraction of the ship, errors in the estimated leeway or in the set and drift of currents, &c.; all of which require to be taken into account. The necessity for frequently checking the *Dead-reckoning* (q. v.), by means of astronomical observations, is sufficiently apparent.

SAINFOIN, or **SAINTFOIN** (*Onobrychis sativa*), a plant of the natural order *Leguminosæ*, suborder *Papilionaceæ*, of a genus nearly allied to *Hedysarum* (see FRENCH HONEYSUCKLE), but having one-seeded pods, which are marked with wrinkles or pits, and are more or less prickly-toothed at the margin. It is a spreading perennial, about 2 or 3 feet high, with leaves of 9—15 smooth acute leaflets, and spikes of

Sainfoin (*Hedysarum onobrychis*).

beautiful flesh-coloured flowers, striated with rose-red, on long stalks. It is a native of the continent of Europe and of the south of England, and is much cultivated as a fodder-plant in dry, and particularly in calcareous soils, to which it is admirably adapted. Its cultivation was introduced into England in 1651; and before the introduction of turnip-husbandry, the sheep-farmers of the chalk districts depended almost entirely upon it, as they still do to such a degree, that in many leases there is a stipulation for the tenant's leaving a certain extent of land in sainfoin. It is, however, a very local crop, being scarcely cultivated on any but the most calcareous soils, where nothing else is nearly equal to it, although it has been found to succeed well on any soil sufficiently dry. There is no more nutritious fodder than S., whether for sheep, oxen, or horses. Even the dry stems of a crop which has produced seed are readily consumed by cattle, if cut into small pieces. S. sometimes endures for 10, or even 15 years on the same land—more generally only for 4 to 7 years; and in the eastern counties of England it is often sown instead of clover on light and somewhat calcareous sands and sandy loams, and the ground is ploughed again in two or three years.—The name S. is perhaps rather *sain-foin*, from the blood-colour of the flowers, than *Saint-foin* (Holy Hay).

SAINT ALBANS. See **ALBANS, SAINT**. (Other names beginning with *Saint*, and not given under

that word, will similarly be found under the other part of the name).

SAINT AMAND, a town of France, in the dep. of Cher, stands on the right bank of the river of that name, 27 miles south-south-east of Bourges. It has a trade in iron. Pop. (1872) 7426.

SAINT AMAND, a small town of France, in the dep. of Nord, 8 miles north-west of Valenciennes. The town contains hot sulphur-springs; and lace, clay-pipes, and porcelain are manufactured. Pop. (1872) 7211.

ST ANDREWS. See **ANDREWS, ST**.

SAINT ANTHONY'S FIRE. See **ANTHONY, SAINT**.

ST ARNAUD. See **LEROY**.

SAINT AU'GUSTINE, an ancient Spanish town on the east coast of Florida, U.S., is built on the western shore of an estuary 2 miles from the Atlantic, 160 miles south of Savannah. It enjoys a mild and equable climate, and is a resort for consumptive invalids. It was founded in 1565, and is the oldest town in the United States. Pop. (1870) 1717.

SAINT AU'STELL, a small town of Cornwall, 13 miles north-east of Truro by railway. Woollen goods are manufactured, and at the bay of Saint Austell, from which the town is about a mile distant, there is a pilchard-fishery, and tin and copper are exported. Pop. (1871) 3803.

ST BEES, an ancient village of Cumberland, pleasantly situated on the bay formed by *St Bees Head*. It is 4 miles south of Whitehaven, and about 10 miles beyond the limits of the Lako district. St Bees is a station on the Whitehaven and Furness Junction Railway. The parish is very large, comprising town and port of Whitehaven, village of St Bees, and several chapelries and townships. The village of St Bees contains about 1100 inhabitants. According to tradition, preserved by the early chroniclers, St Bees originated in a nunnery founded here, 650 A.D., by an Irish saint named Bega, of whom Sandford's MS. (in the Dean and Chapter Library, Carlisle) records a very pretty legend. It appears to have been destroyed before the reign of Henry I., in whose time we find that Ranulph, Earl of Cumberland, reconstituted it as a priory; but after the dissolution of the monasteries, it went to ruin. The institution known as *St Bees College* was established in 1816 by Dr Law, then Bishop of Chester, to supply a systematic training in divinity to young men desirous of ordination, whose means were inadequate to defray the expenses of a university education. The bishops of the province of York had previously been compelled to ordain a number of such men as literates, the poverty of many of the northern benefices not securing a sufficient supply of graduates. A portion of the ruined priory of St Bees was fitted up by the Earl of Lonsdale as lecture-rooms, library, &c. On the recommendation of the bishop, an incumbent was selected for the perpetual curacy of St Bees (value, £100 per annum) by the patron, the Earl of Lonsdale, with a view to his holding the position of Principal of the College in connection with the living. The Principal selects his own staff of lecturers. The expenses are defrayed from the fees paid by the students—£10 each term. The College course extends over two years, each divided into two terms, from about January 28 to May 5, and August 25 to December 5. During this period, the standard English divinity works, with the Greek Testament, are chiefly studied, and the composition of sermons, &c., practised. The students reside in lodgings in the village, under the control of the Principal, and

SAINT CATHERINE'S—SAINT JOSEPH.

attend the service daily in the parish church, the transepts of which were restored in 1855 for their accommodation. A new lecture-room and library were built in 1863, adjoining the ancient structure. Students are admitted at the age of 21, on producing testimonials of character, &c., satisfactory to the Principal. Graduates of a university where there is no divinity course, are admitted to the second year's course on producing their diploma, along with the usual testimonials as to their fitness for the ministry. Students who have passed the course are not now confined to the northern province, as was the original design, but are admitted into most of the southern dioceses. The average number of students on the boards is about 100. Near the church is an endowed grammar-school. St Bees is in some repute as a sea-bathing place.

SAINT CATHERINE'S, an incorporated town of the province of Ontario (formerly Canada West), Canada. It is on the Welland Canal, and is a station on the Welland Railway. The town is very flourishing, and has large manufactures of machinery and agricultural implements. The surrounding country is very picturesque. The well-known mineral well of St C's, whose water is of great value as a remedial agent, supplies on an average 130,000 gallons a day. Of these waters, a large quantity, partially evaporated, is sent out through the country. A second well, similar to the first, is also in use. St C's has been called the Saratoga of British America. Its hotels are equal to any in the province. St C's is 33 miles to the south of Toronto, and 12 miles from Niagara Falls. Pop. (1871) about 11,000.

SAINT CROIX, an American river, called also the Passamaquoddy, which, flowing out of Grand Lake, on the eastern border of Maine, runs east-south-east 75 miles to Passamaquoddy Bay, and forms a portion of the boundary between the United States and New Brunswick.

SAINT DOMINGO. See **HAYTI**.

SAINT DOMINGO BARK. See **CARIBBEE BARK**.

SAINT-MARIE-AUX-MINES (Ger. *Mar-kirch*), a manufacturing town in Upper Alsace, Germany, 14 miles north-west of Colmar. In former times, it owed its prosperity to the silver mines in the vicinity; these, however, are now exhausted. Dyeing, yarn-spinning, manufactures of cotton, paper, and cherry-brandy are now the principal branches of industry. Pop. (1872) 12,319.

SAINTES, an old town of France, in the dep. of Charente-Inférieure, on the left bank of the Charente, 43 miles south-east of La Rochelle. In ancient times, this town, under the name of *Mediolanum*, was the capital of the Santones, from whom the subsequent province derived the name of Saintonge. It contains interesting Roman remains, as a triumphal arch, and the ruins of an amphitheatre, circus, &c. Pop. (1872) 9334.

SAINT GEORGE'S ENSIGN is the distinguishing flag of the British navy. It consists of a red cross on a white field, with a union-jack in the dexter chief corner, as shewn in fig. 2 of the article **FLAG**. Under **FLAG OFFICER**, it is implied that an admiral, vice-admiral, or rear-admiral may have his flag red, white, or blue, according to the squadron to which he belongs. By a regulation of 1864, this old custom was altered; the squadrons are abolished, and the white Saint George's ensign is the badge of all ships in the navy. The red and blue ensigns are now left to government vessels—not being ships of war—and merchant vessels respectively. The ensign is borne at the peak, or,

in harbour, on a flagstaff at the stern; in boats the latter is the only mode of flying it. A full ensign is the largest flag used, being often a little smaller than the quarter-deck of the ship which hoists it.

SAINT-GERMAIN-EN-LAYE, a town of France, in the dep. of Seine-et-Oise, on an elevation on the left bank of the Seine, 14 miles by railway west-north-west of Paris. It contains three handsome squares, a parish church, with a monument erected by George IV. over the remains of James II., several learned and other societies, and some factories. Pop. (1872) 12,695.

S.-G. had its origin in a monastery built by King Robert in the beginning of the 11th c., on the summit of the hill which was surrounded by the forest of Lyda (*Laye*), and dedicated to St Germain. The town, as well as the royal château, which was destroyed either during the reign of King Robert, or afterwards, was sacked by the English in 1346, in 1418, and in 1438. At S.-G. the marriage of France was celebrated, and this king rebuilt the château in 1547. From before the time of Philippe-Auguste S.-G. had been the residence of the French kings during a portion of the year, but Louis XIV. transferred the court to Versailles, and from that time the fortunes of S.-G. declined. Later the château of S.-G. was assigned by Louis XIV. as the residence of the dethroned James II. of England, and here in exile that monarch held his court, devoting almost the whole day to religious observances. The château is now used as barracks and for other purposes. The Forest of St Germain comprises 10,873 English acres.

SAINT HELENS, a municipal borough of Lancashire, on a small affluent of the Mersey, 3 miles north-east of Prescott by railway. It is a small, ill-built, but thriving town, with an extensive trade in coal, and containing plate-glass, glass-bottle, and other works. The town also contains potteries, breweries, tan-yards, iron and brass foundries. Pop. (1861) 18,396; (1871) 45,134.

SAINT HELEIERS, capital of Jersey (q.v.), chief of the Channel Islands, is situated on the north shore of the island, and on the east side of St Aubin's Bay, lat. 49° 11' N., long. 2° 6' W. It is defended by Elizabeth Castle, on a rocky island off the shore, approached by a causeway at low water; and Fort Regent, on the south-east side of the town, built about 1806, on a scarped granite rock at enormous expense. A great extension of the harbour works, not yet completed, was found in 1867 to be necessary. At spring tides, the water rises 4 feet. Victoria College—a handsome edifice, built on an eminence, in 1851—the hospital, the theatre, and the churches, are the chief buildings. The town has rapidly increased within recent years. An active trade is carried on with England, France, and India. Pop. of town and parish, 30,750, including a garrison of upwards of 500 men.

SAINT IGNA'TIUS' BEAN. See **NETTLE** and **STRYCHNOS**.

SAINT-JEAN-D'ANGÉLY, a small town of France, dep. of Charente-Inférieure, 15 miles north-east of Saintes. Pop. (1871) 5746.

SAINT JOHN'S BREAD. See **CAROL**.

SAINT JOHN'S WORT. See **HYPERICUM**.

SAINT JOSEPH, a city of Missouri, U.S., on the left bank of the Missouri River, on the north border of Kansas, 496 miles by water from St Louis. It is connected by railway with Hannibal on the Mississippi, and is the chief depot for the emigrant and supply trains to the western settlements. It has a court-house, ten churches,

SAINT JUST—SAINT MALO.

convent, several large hotels, eight newspapers, three of which are dailies, steam-mills, and factories, and a large trade with the interior of the continent. Pop. (1870) 19,565.

SAINT JUST, LOUIS ANTOINE DE, a notable figure in the first French Revolution, was born at Azeize, in Nivernais, 25th August 1767, educated at Joussons by the Oratorians, and afterwards went to Rheims to study law, but soon returned to his native village, where he devoted himself exclusively to literature. When the revolution broke out, S. J. was transported with enthusiasm, and became one of its most ardent apostles. Probably no man in France was a more genuine fanatical believer in the brilliant illusions of the period. Spotless, even austere, in his morals, reserved in manner but eloquent in speech, and rigorously earnest in his convictions, he rapidly rose into consideration among the inhabitants of his native commune, who elected him lieutenant-colonel of the National Guard, sent to Paris in 1790 to assist at the Fête de the Federation. In 1791, appeared his *Esprit de la Revolution et de la Constitution de la France*, in which the various scenes of the revolution are sketched in a calm, even, precise sort of way; and in the following year he was chosen deputy to the convention by the electors of Aisne. S. J. entered Paris on the 18th of September, fifteen days after the frightful massacres, which Lamartine in his *Histoire des Girondins* with melodramatic inaccuracy represents him as ordering in conjunction with Robespierre! He voted for the death of the king, and in an oration full of stern and exaggerated republican sentiment, gave his reasons. It was this speech that made him famous and influential. The Girondins tried to win him over, but in vain. In all the fierce debates of his period, S. J. took a leading part; but he also displayed a great capacity for administrative organisation, and on the 11th of February 1793, carried his project for the formation of a committee to superintend the war. After the fall of the Girondins in June (S. J. took no part in their overthrow, and never once spoke during the disastrous struggle between the two sections), the civil war broke out, and it is from this point that we date the exhibition of that intense and merciless republicanism which fitted him so well to be the associate of Robespierre. It is commonly thought that S. J.—perhaps because he was so young—was merely an instrument in the hands of Robespierre; but the known facts of his career lead to a very different conclusion, and some writers have not scrupled to make S. J. the real head of the extreme party who organised government in France during the *Reign of Terror*. Almost all the energetic, or, as some would prefer to say, sanguinary, measures drawn up to repress the royalists and timid republicans at home, and to repel the forces of the allied monarchs on the frontier, were devised by him. On the 19th of February he was elected president of the convention. He drew up the terrible report which led to the arrestment and execution of Fabeat, Danton, and their adherents. S. J. had no scruples in cutting off his opponents. The intensity of his convictions rendered him indifferent to deeds of cruelty, however appalling. When the political reaction set in, and the party of moderation had got the upper hand in the convention, Robespierre and S. J. were seized and imprisoned (27th July 1794), and ordered to be guillotined next day. S. J. suffered with sullen calmness—not a word escaping his lips. See Ern. Hamel's *Histoire de Saint Just* (Paris 1859).

SAINT LÔ, an old town of France, capital of the dep. of Manche, built on a rocky elevation

on the right bank of the river Vire, 53 miles by railway south-east of Cherbourg. From the high central part, several streets, more or less steep, branch off in different directions. The town, which is said to owe its origin and its name to a St Lô, bishop of Coutance, who caused a church to be built here in the 6th c., was destroyed by the Normans in 888, and taken by the English in 1346, and again, in 1417. Noteworthy are the beautiful churches of Sainte-Croix, founded in 805, and of Notre Dame, which dates from the 15th century. Flannels, druggets, and cotton fabrics, cutlery, and leather, are manufactured, and a considerable supply of horses for cavalry are here obtained. Pop. (1872) 8088.

SAINT LOUIS, a port of entry of Missouri, U.S., the chief city and commercial metropolis of the central Mississippi valley, stands on the right bank of the Mississippi, 18 miles below its confluence with the Missouri, and 174 miles above the mouth of the Ohio. It is regularly built upon the limestone bank of the river, on two terraces, rising 20 and 40 feet above high water, with wide and well-built streets running parallel to the river, crossed by others at right angles. The principal structures are a city hall, court house, custom house, arsenal, merchants' exchange, mercantile library, city hospital, marine hospital, university, cathedral, and several of the largest hotels in the world. There are 76 churches, of which 19 are Roman Catholic; 3 general hospitals, 10 orphan, and numerous other asylums, and 7 convents; the St Louis University, under charge of the Society of Jesus, with 18 professors; the Washington University, Academy of Sciences, German Institute, normal and high schools, 53 periodical publications, 11 daily papers, 9 German papers, an opera house, and 5 theatres. Several city railways have replaced the omnibuses, and the water supply is pumped from the Mississippi. Among the manufactures are flour and lumber mills, sugar refineries, lard and linseed-oil factories, provision packing-houses, manufactures of hemp, whisky, tobacco, and vast iron foundries and machine shops, which in the year 1866 produced goods valued at 87,000,000 dollars. S. L. has a vast trade by steam boats to the whole Mississippi valley, 68,000 tons being owned there, and extensive railway connections. It is also the chief centre of the American fur trade, and of a vast traffic in agricultural produce. There are 7 banks, and 24 insurance companies. In 1764, S. L. was the depot of the Louisiana Indian trading company; in 1768, it was captured by a detachment of Spanish troops; in 1804, was ceded with the whole country west of the Mississippi to the United States; the first brick house was erected in 1813; in 1820, its population was 4500; in 1860, 151,780; in 1870, 310,861.

SAINT LUCIE BARK. See CARIBBEAN BARK.

SAINT MALO, a fortified seaport of France, in the dep. of Ille-et-Vilaine, at the mouth of the river Rance. It stands on a small island less than three miles in circumference, called *Le Rocher d'Aaron*, which lies close off shore, and is connected with it by a causeway, 650 feet long, called *Le Killon*. The island is completely covered by the town; the streets are narrow, filthy, and ill-ventilated, and the houses are built to the height of five and six stories. The harbour is spacious and secure, but its entrance is narrow, and is thickly set with rocks and shallows. It is perfectly dry at ebb-tide, but the flood tide rises here from 45 to 50 feet. Numerous strong forts, both on the mainland and on the small islands that stud the rocks, protect the harbour and town. The harbour

SAINT MICHAEL'S—SAINT PAUL

works were completed under the second empire, and have cost from first to last nearly 20 million francs. Ship-building is the principal branch of industry. On the island of Grand-Bé, a short distance from the ramparts, is the tomb of Chateaubriand (q. v.). Many vessels are employed in the mackerel, cod, and whale-fisheries, and active commerce is carried on. S. M. communicates with Rennes (the capital of the dep.) by a railway opened in 1864. Pop. (1872) 8700.

SAINT MICHAEL'S, the largest and most important of the Azores (q. v.), and, with the exception of St Mary's, the most eastern island in the group. Area, 224 sq. m., or 143,000 acres; pop. about 81,000. The island is mountainous, and rises in its highest summit to 3560 feet. Of the whole acreage, 40,000 acres are arable, and about 5000 acres are pretty equally divided between orange gardens and vineyards. In 1863, the total value of the exports, the larger portion of which goes to Great Britain, was £136,397; and the total value of the imports, of which more than a third consisted of general merchandise from Great Britain, amounted to £145,770. The crop of oranges, which form the staple article of the commerce of this island, was a large one in 1863; 189,686 boxes, representing a value of £67,141, were exported, and all to Great Britain. Ponta Delgada (pop. about 16,000) and Ribeira Grande (pop. about 5000) are the principal towns.

SAINT MICHAEL'S MOUNT, a conical and isolated rock in Mount's Bay, Cornwall, 3 miles east of Penzance. It communicates with the shore by a causeway 400 yards long, which, however, is covered with water 8 hours out of the 12. The Mount is 195 feet high, is about one mile in circumference, and is crowned by an old and picturesque castle—now used as a manorial residence—surmounted by a tower, on one angle of which there is a projecting stone lantern, popularly called *St Michael's Chair*. At the base of the Mount is a fishing village, of about 30 houses. This hill is to the geologist one of the most curious of localities, and, indeed, it is said to have 'excited more geological controversy than any mountain of the world.' At a very early period, S. M. was the seat of a religious house, and the apparition of St Michael is said to have appeared on one of its craggy heights. At the Conquest, the monastery of St Michael was annexed to the abbey of St Michael in Normandy. It long remained in the possession of the monks, and afterwards became the residence of several families in turn, until it was sold in 1660 to its present proprietors, the *St Aubyns*.

SAINT MICHEL, MONT, an extraordinary rock in Cancale Bay, in the north-west of France, 7 miles south-west of Avranches. It is a solitary cone of granite, 5 miles in circumference at the base, and rising to the height of 400 feet. It rises sheer out of a level expanse of sand, and though its elevation is not great, its perfectly flat environment and its pointed crest render it a most striking feature in the landscape. It is crowned by a church and castle, under which are conventual buildings, with their lofty turrets and high walls, and lower down still are the houses of the small town, which seem to adhere to the steep rock like limpets. A good road leads from the shore to the wide sands which surround the mount, and which are covered with water at every tide, except at neap-tides. At low-water there is a dry and firm track, about a mile in length, across the sands; but on both sides of it are dangerous quicksands. In the 8th c. an abbey which replaced an ancient temple of Jupiter was founded on the summit of the rock. A church,

and an almost impregnable fortress, were afterwards founded by the Normans. After the Revolution the main building was changed into a prison. The castle has recently undergone restoration.

SAINT NAZAIRE, a thriving seaport of France in the dep. of Loire-Inférieure, at the mouth of the Loire, on the north bank of that river, and 38 miles west of Nantes, with which it is connected by railway. Almost unknown till within recent years it is now one of the most important ports on the west coast of France. In 1861, it contained 221 in 1861, 6500, and in 1872, 11,498 inhabitants. Here the government constructed a floating dock of 2 acres area, and another dock, of double the area is in progress. St N. is the port for the Transatlantic steamers to the West Indies and Mexico. One cause of the rapid rise of this port is, that the navigation of the Loire is becoming year by year more difficult, owing to the sand brought down the river; so that the chief shipowners of Nantes prefer to leave their vessels at St N., and have the cargoes transported inland by railway.

SAINT NEOT'S, a small market town in the county of Huntingdon, 8 miles south-south-west of the town of that name, occupies low ground on the banks of the Ouse. Its beautiful parish church has a tower 156 feet high. St N.'s has a large foundry, an engine factory, breweries, steam flour mills, &c. About a mile from the town are large paper-mills. Pop. (1871) 3200.

SAINT NICHOLAS, a flourishing manufacturing and market town of Belgium, in East Flanders, 20 miles east-north-east of Ghent, on the Ghent and Antwerp Railway. It stands in the midst of the Pays de Waes, a densely peopled and productive agricultural district, and is said to be the seat of the largest flax-market in the world. The market is held in the great square of the town, one of the largest in Belgium, but which, however, is too small to accommodate comfortably the immense numbers who crowd hither on market-days. S. N. is a manufacturing town of the first class; and among the articles largely manufactured are cotton, wool, and silk stuffs, carpets, hats, lace, tobacco, &c. pipes. There are print-fields, dyeworks, and tanneries, and a flourishing trade is carried on in shawls, linens, and other manufactured goods as well as in flax, corn, hops, &c. Pop. 23,600.

SAINT OMER, a town of France, and fortress of the third rank, in the department of Pas-de-Calais, on the Aa, 26 miles south-east of Calais by railway. It is surrounded by irregular but well-appointed fortifications, is well built amid parks and contains numerous fountains and more than an important ecclesiastical edifice. Woollen cloths, blankets, pottery, and clay pipes are manufactured and there is considerable general trade. Pop. 18,403. A college for the education of English Irish Catholics was opened at S. O. during the penal times. It was closed, however, during the Revolution; but still exists as a seminary, and is attended by from 15 to 20 students.

SAINT PA'NORAS, one of the northern suburbs of London (q. v.).

SAINT PAUL, a city, port of entry, and capital of Minnesota, U.S., is on the east bank of the Mississippi River, 2080 miles from its mouth, 219 miles below the Falls of St Anthony; lat. 44° 52' 45" N., long. 93° 5' W. It is built upon a plain 80 feet above the river, and 800 feet above the Gulf of Mexico. Hills near the city abound with springs of excellent water. S. P. is at the head of navigation for the large steamboats of the Lower Mississippi and its branches, and the centre of a large

SAINT PAUL DE LOANDA—SAINT PETERSBURG.

and growing trade in flour, lumber, furs, &c. It is a state-house, cathedral, college, 14 churches, many hotels, a daily newspaper, and educational and charitable institutions. In 1846, there were 10 white inhabitants. Pop. (1860) 10,277; (1870) 20,030.

SAINT PAUL DE LOANDA, a considerable port on the south-west coast of Africa, the principal Portuguese settlement in Lower Guinea, stands at the mouth of the river Bengo, in lat. about 5° 54' S. It is the largest and most important European settlement on this coast, and contains 2,000 inhabitants, of whom 830 are white, 2,400 mixed, and 900 black. The climate is comparatively healthy, the harbour is beautiful, and protected by one large and two small forts. The houses are good, the streets unpaved, and there are three churches and three market-places. Abundance of fruit and vegetables, bullocks, and goats are obtainable in the markets. Ivory and bees-wax are the principal exports.

SAINT PETERSBURG, a maritime government of Russia, one of the Baltic Provinces, between Lake Ladoga on the north-east and Lake Peipus on the south-west. Area 17,057 sq. m.; pop. 1,160,930. The soil is damp and thin, and woods and marshes cover two-thirds of the level surface. In the vicinity of the capital, much ground is laid out in market-gardens. The usual crops are grown, but the quantity of corn produced is greatly less than the quantity consumed. The chief town is the capital, *Saint Petersburg* (q. v.).

SAINT PETERSBURG, the capital of the Russian empire, and of the government of the same name, stands upon, and around the lower branches of, the Neva, and on the shores of the eastern extremity of the Gulf of Finland, 16 miles east of Cronstadt, its port. Lat. 59° 56' N., long. 30° 19' E. The Great Neva, the most southern branch of the Neva, divides the city into two great sections—the Petersburg Side on the north, and the Great Side on the south. The former is built on the islands which are formed by the delta of the Neva, the chief of which are the Vassili Ostrov, the Citadel Island, and the islands Aptekarskoi, Kammennoi, Krestovskoi, and Elaghinskoi. The Great Side, south of the Great Neva, is compactly built, and contains the residences of the court and the nobility, and more than half the population. The city covers an area of 42 sq. m., stands 56 feet above the level of the sea, upon plains which were formerly malarious marshes, but are now for the most part drained and laid out in meadows and gardens. Pop. (1863) 539,475; (1871) 667,963.

The climate, severe in winter, is as pleasant and mild as that of Scotland in summer. The mean temperature in summer is 62°; in winter, 14° F. The extremes of temperature are 99° and -51°. The fourteen arms of the Neva, irrespective of the smaller branches, ramify through S. P., and there are seven canals.

General View of Saint Petersburg.—Approaching the city from Cronstadt (q. v.), the port and fortress of the Russian capital, the first indications of the great city are the gilded dome of the church of St. Isaac, and the lofty spire of the Admiralty, which are seen rising apparently from the water's edge. The Admiralty Square, faces the English Quay on the south bank of the Great Neva, and may be considered the centre of the city. From the spire, with its numerous galleries, the whole plan of the city can be clearly seen. Right opposite it is the populous Vassili Ostrov, on the south shore of which are the Bourse, Academy of Sciences, Corps of Cadets, &c. To the north is the Citadel Island,

and further north the densely-peopled Aptekarskoi Island, and the Kammennoi, and other islands, which are for the most part studded with wood-embosomed villas, and laid out in charming gardens. Considering the river on the north as the chord, and the Admiralty as the centre, the semicircle that might be drawn with a radius of 2½ miles, would pretty nearly describe what is called the Great Side of Saint Petersburg. This section of the city is divided into three or four portions by the Moika, St. Catharina, Fontanka, and New Canals; and it is intersected by three spacious streets, which radiate east-south-east, south-east, and south from the great centre, the Admiralty. The streets are named respectively the Nevski Prospekt (Neva Perspective), Gorokhovaia Oulitsa (Peas Street), Vosnosenski Prospekt (Resurrection Perspective). Extensive suburbs also are rising on the eastern bank of the Neva, seven miles above its mouth.

Streets, Squares, Monuments, Bridges, Churches, &c.—The street architecture of S. P., unlike that of Moscow, with its pale-yellow walls and red and green roofs, is almost destitute of colour. Here the rigid, military aspect of the streets, with the houses drawn up in long regular lines of gray, or massed together in blocks like the squares of battalions, is one of the first features of the Russian capital that impress themselves upon a traveller. Except in the more fashionable quarters, the greater number of the houses are built of wood; but owing to the liability of such houses to catch fire, building in this material is very much discouraged. S. P. contains 500 streets, and among these, lanes and alleys are unknown, as, while the finest streets have a breadth of 120 feet, the narrowest are 42 feet broad. The Nevski Prospekt is the most splendid street in S. P.; and for architectural grandeur, as well as for natural beauty, for proportions, and for variety, is considered the finest street in Europe. It is 130 feet broad, and about 4 miles long, is planted on both sides with trees, contains a large number of the most beautiful palaces, of highly ornamented churches, and splendid warehouses, and increases in breadth and magnificence as it advances from the Admiralty. For the first mile, it does not contain more than about 50 mansions, each of which, however, is of colossal magnitude. The houses are built of brick faced with stucco, are three and four stories high, and are in many cases furnished with ornamental porches, colonnades, gilded balconies, and parapets that gird the flat roofs. About ten of the other streets of the city are distinguished for their grandeur, though none of them equals the Nevski Prospekt. There are 64 squares in the city, and of these the Admiralty Square is one of the most famous. It contains one mass of buildings, presenting to the Neva a fine façade, nearly half a mile in length, while its sides are 650 feet long. In the Palace Square, adjoining the Admiralty, stands Alexander's Column, an immense monolith, erected in 1834. It consists of a shaft of red granite, standing on a pedestal of the same material, and supporting a capital, above which rises the figure of an angel and a cross. The length of the shaft is 80 feet, and that of the whole column 150 feet. Peter's Square contains the noble and well-known equestrian statue of Peter the Great, 18 feet high, and erected 1768—1782. The Field of Mars, with an area large enough to allow of 40,000 men being put through military evolutions, contains the colossal bronze statue of the famous Suwaroff.—*Bridges.*—Of the 150 bridges that unite the islands, cross the canals, and span the Neva, the Annitchkoff Bridge, leading across the Fontanka Canal, consists of five arches, is 110 feet long, and is decorated with four spirited groups, in

SAINT PETER'S LE PORT—SAINTS.

bronze, of wild horses and their tamers, by a native artist. The Nikolayevski Bridge, a magnificent structure in granite, and the only permanent bridge save one that crosses the Neva—the others being temporary bridges supported on boats, and removed every autumn and spring—was completed in 1850. It crosses the Neva from the English quay on the south bank to the Vassili Ostrov shore, is 1200 feet long, and consists of 7 elegant arches, supported upon ponderous piers of granite. At the northern end of the bridge, there is a drawbridge which affords a passage to ships. No part of S. P. affords a foundation solid enough to support weighty structures. The foundation for the Nikolayevski Bridge was not obtained until three sets of piles had been driven into the oozy bed of the river, the one on the top of the other, and so close, that all the timbers touched each other all the way across.—

Palaces, &c.—S. P. might be called a city of palaces, from the number of the edifices of that description which it contains. The Winter Palace, destroyed by fire in 1837, but soon after rebuilt, is certainly the largest, and, in one sense, most probably the most magnificent palace in the world. It is 700 feet long on every side, has an imposing façade, and contains 800 inhabitants, and, during the residence of the emperor within it, is inhabited by 6000 people. It has numerous ample halls, decorated in the most artistic manner, and containing collections, furniture, and articles of *virtu* of immense value. The Hermitage, situated on the Neva like the Winter Palace, is connected with that structure by several galleries. Its gallery of 2000 paintings is famous for its specimens of the Spanish school. The library of this palace contains the collections of Diderot, Voltaire, &c., and contains in all 120,000 vols. The Annichkoff Palace is the usual residence of the emperor. The Imperial Library, one of the first in Europe, contained, in 1867, 1,044,045 vols., and 34,178 MSS. The gilded tower of the Admiralty buildings, which is said to be visible from Cronstadt, and certainly forms in these flats a most conspicuous landmark, is 230 feet high. The Old and New Arsenals are surrounded by cannon taken from the Turks and Persians.—*Churches.*—S. P. contains 177 churches, besides 140 private chapels (*kauskapellen*). Within the Citadel stands the church of St Peter and St Paul, finished in 1727. It is surmounted with a slender tower, crowned by a gilded spire, the whole being 345 feet high. The cathedral of St Izak, though destitute of architectural beauty, is remarkable for its rude magnificence, and is one of the most considerable buildings of modern times, is 330 feet long, 290 feet broad, and 310 feet high. It is surmounted by a great gilded dome, and by four smaller domes. The domes are made of bronze, and the value of the plate-gold by which they are overlaid is stated at £50,000. Each of its four sides is adorned with a peristyle of 12 or 16 pillars, each consisting of one block of red Finland granite. These pillars are 53 feet high, and are seven feet in diameter at the base.

Academies, Scientific Institutions, &c.—The Academy of Sciences, with a library of 100,000 volumes, was founded by Peter the Great in 1725. In the Institute of Technology, founded in 1829, 200 pupils are taught silk-spinning, the manufacture of cloth, silk, and woollen stuffs, wood-cutting, and engraving on copper. The University, founded in 1829, is attended by 600 students, and has a staff of 60 professors. The New National Museum of Antiquities, Painting, and Sculpture, completed in 1851, is a noble structure, built entirely of marble and metal. Other institutions, as the School of Mines, the Goetinoi Dvor or Bazaar, are worthy of mention. There are numerous benevolent institutions, a

number of splendid theatres, and an Italian opera, a magnificent structure.

Manufactures.—Of the manufacturing cities of Russia, S. P. is one of the most important. Its principal private factories are mills for spinning and weaving cotton. The immense imperial establishments produce the most admired specimens of Gobelin tapestry, mirrors, articles in bronze, playing-cards, crystal, and porcelain.

S. P. is little more than a century and a half old, and yet it takes rank among the first capitals in the world. It was founded by Peter the Great, May 1703. After a long struggle against the severe climate, insalubrious from the exhalations of wide-extensive marshes, and from the arctic rigour which even yet can cover the Neva with ice a yard and a half thick, at length the town was founded and declared the capital in 1712. Under the successors of Peter the improvement, embellishment, and extension of the city were carried on. Catharine II. constructed the great canals which, while they afford means of ready communication, serve also to drain the marshlands, to render the atmosphere more healthy, and to mitigate the rigours of winter. The city suffered great damage and the loss of several hundred lives in 1824 from an inundation of the Neva; and in April, when the ice breaks up, the lower regions of the city are threatened with a similar disaster. At S. P., all the ministers from foreign courts are bound to reside.

SAINT PETER'S LE PORT, or commonly *St Peter's*, the chief town of Guernsey, one of the Channel Islands. See GUERNSEY.

SAINT PIERRE, the chief town, though not the seat of government, of the island of Martinique (q. v.), belonging to France, stands at the head of a bay, 16 miles north-west of the capital, Fort de France (formerly Fort Royal). It is the largest town in the Antilles, with a pop. of 23,000, and is the chief entrepôt of those islands.

SAINTS, a name applied in the New Testament to the members of the Christian community generally, but restricted by ecclesiastical usage from very early times to those who, whether under the old or under the new dispensation, have been especially remarkable for their personal virtues and their eminent services to the cause of religion. Of the old dispensation, the 'patriarchs and prophets' are commonly designated as saints. In the word is used much more of the Christian Church. In the ages of persecution, the quality which most of all challenged the admiration and reverence of the faithful was naturally constancy and constancy in the profession and the defence of the Christian faith; and thus the earliest of those whom the church reverences for sanctity of life were also, for the most part, revered as champions of the faith. In general, however, the saints are distributed into several classes, chiefly in relation to the special services which the church has appropriated to their honour. Thus we find enumerated: (1.) Apostles and Evangelists; (2.) Martyrs; (3.) Confessors, a name applied primitively to those who had exhibited great constancy in professing the faith, although without the final crown of martyrdom, but in later times understood of all who, without being martyrs, were eminent for sanctity of life; (4.) Doctors or men eminent for sacred teaching; (5.) Virgins; (6.) Matrons and Widows distinguished for holiness of life. Anciently the character and appellation of saint was bestowed upon individuals, as it were, by acclamation, and by the common voice of the members of the particular Christian community to which the individual belonged, and which his merits were most familiar. The earliest

examples, as may be seen in the letter of the Church of Smyrna on the martyrdom of Polycarp, of such judgments as to individuals were in the case of the martyrs. Altars were erected at their tombs, and the people assembled for worship on the anniversary of their martyrdom. Even then, however, the letters of St Cyprian (Epp. 37 and 39) show that caution was observed by the bishops to guard against the recognition of undeserving individuals. The honours of the martyrs, even before the age of persecution had passed, were extended to confessors of the faith, and eventually to all who were eminent for holiness of life, and especially to those who obtained the reputation of performing miracles. The names of those who were so honoured were placed in the register (or diptych) of each church. It was not, however, till a comparatively late period that a regular form of procedure was established in the Roman Church for the purpose of setting the claim of individuals to the authentic reputation of sanctity. From the 4th c. downwards, examples of reference to Rome—as, for instance, in the Acts of Virgilius, Bishop of Trent—are cited by Catholic writers. But the first recorded example of a solemn and public decree is the case of Udalric or Ulric, Bishop of Augsburg, to whom the honours of sanctity were adjudged by Pope John XVI (see Hardouin, Concil. VI. P. I., 172) in the end of the 10th c. (993). Since that time the procedure of the Church of Rome as to the public recognition of the saints has been matured and methodised. It consists of two stages, that are called respectively 'Beatification' and 'Canonisation.' The former is but a preliminary process, and consists in a declaration by the pope that the beatified person is entitled, by reason of his (or her) eminent virtues, attested by miracles, to be regarded as a saint, and as such honoured and invoked. This authorisation, however, is not in beatification extended to the entire church, but is always limited to a particular church, or province, or religious order; and the nature of the honours permitted to be paid to the beatified person is strictly defined either by the terms of the decree, or by local usage, if such have already existed. But though the effect of a decree of beatification is less comprehensive than that of the subsequent and final declaration in canonisation, the preparatory inquiry is in all substantial particulars the same. The details of both are explained at great length and with curious minuteness by the learned Pope Benedict XIV. (Lambruschini) in a special work on the subject, which has the further interest of containing as an appendix the minutes of the entire proceedings in the canonisation, which took place during his own official connection with that department. The inquiry in both procedures is conducted by the congregation of cardinals, called the Congregation of Rites, and consists first in an examination of the writings (if there be any) of the individual, then of the holiness of his life and conversation, and finally of the miracles alleged to have been performed by him in life, or obtained through his relics and intercession after death. Two such miracles at least must be established by what is considered satisfactory evidence. Upon all these points sworn depositions are required, and all are subjected to a most rigorous scrutiny, in which the office of impugnator is discharged by an advocate called Promotor Fidei, and popularly nicknamed the Devil's Advocate, his duty being to raise every possible difficulty in the way of the acceptance of the evidence of sanctity. This inquiry is generally a very protracted one; and after it has been completed, and its results recorded in writing, the acts are submitted to the cardinals, who meet three

times in private congregations, and finally, if all appears satisfactorily established, in a public congregation, by which the decision is made known to the pope. Should the decision be approved by the pope, the solemnisation is proceeded with. The solemnity takes place in the Vatican Church. The cardinal prefect of the congregation of rites hands the pope's brief to the cardinal, arch-priest of the Vatican, by whom it is read; the *Te Deum* is intoned; the image of the beatified individual is uncovered, to receive the veneration of the assembly; high mass, with the Collect, in his honour, is sung; and in the afternoon the pope goes solemnly to the church to pay reverence to the image. The procedure, in case of a martyr, is somewhat different. In both, however, the process is but preliminary to the solemn canonisation. The effect of the latter comprises (1.) a declaration that the canonised person is to be recognised as a saint throughout the entire church; (2.) that he is to be invoked in the public prayers; (3.) that churches and altars may be erected in his honour; (4.) that he may be invoked in the mass and public service; (5.) that a festival may be celebrated in honour of him; (6.) that his image may be set up in public; and lastly, that his relics may be preserved and publicly honoured. The solemnity of canonisation, which is preceded by a new inquiry similar to that of the beatification, and a new judgment of the congregation of rites confirmed by the pope, is one of the most gorgeous in the entire ceremonial of the Roman Church. It takes place in the Vatican Church (St Peter's), and is generally attended by a large assembly of bishops from various parts of the church. In many respects it resembles that of the beatification, but its distinctive characteristic is the solemn publication, by order of the pope in person, after the hymn of invocation of the Holy Ghost has been sung, of the decree of canonisation. This is followed by mass, also celebrated by the pope in person, and sometimes by a homily of the pope in honour of the newly canonised. The Church of St Peter's is specially decorated at a vast cost for the ceremonial, and the entire expenditure on such occasions has been estimated at not less than £20,000. Roman Catholics hold that in such decrees the judgment of their church is infallible; and to deny that any particular canonised individual is really a saint, is held to involve, if not actual heresy, at least a grievous act of contumacy against the faith of the church. On the doctrine of saint worship, see INVOCATION OF SAINTS; and on that regarding the honour paid to relics of saints and martyrs, see RELICS.

SAINTS' DAYS, days set apart in honour of particular saints and martyrs. The practice dates from the times of persecution, when the people were wont to assemble at the tombs of martyrs on the anniversary of the martyrdom. In the multiplication of such celebrations, a record of the days fixed for each saint or martyr became necessary. This was called *calendarium*. The days so appointed were celebrated with more or less solemnity, according to the dignity of the saint, or the degree of devotion with which he was regarded. In some cases the saint's day was kept as a holiday of obligation, in which no servile work was permitted to be done. Other days are of various minor degrees of solemnity, and are called double (greater or lesser), semi-double, and simple, from the peculiar form of the office set apart for each. In particular countries, provinces, dioceses, or parishes, the day of the patron saint is specially celebrated; and in all churches the festival of the saint to whom the church is dedicated.

SAINT SERVAN, a seaport of France, in the

and the public expenditure to £26,025. The value of total imports was £157,337; of exports, £255,977 (nearly £200,000 of which represented the value of sugar exported). In the same year, vessels having a total tonnage of 42,190 tons, entered and cleared the ports, the chief of which, and the capital of the island, is Kingston (q. v.).

SAINT VINCENT, CAPE, in Portuguese *Cabo da São Vicente*, a promontory forming the south-western corner of Portugal and of Europe, off which several important naval battles have taken place. On June 16, 1693, Admiral Rooke, with 20 English men-of-war, was here attacked by a vastly superior French fleet, and defeated with the loss of 12 men-of-war, and 80 merchantmen which were sailing under his convoy; on January 16, 1780, Admiral Rodney here destroyed several Spanish ships; on February 14, 1797, the great battle of Cape St V., between 15 British line-of-battle and 6 frigates, under Admiral Jervis (afterwards created Earl St Vincent), and 27 Spanish line-of-battle and 12 frigates, resulted in the total defeat of the latter and capture of 6 of their largest ships (of which, however, 4 only were ultimately secured). The effect of this last victory was to frustrate the formidable Spanish-French scheme of invading England. The fourth naval fight off Cape St V. took place between the fleet of Queen Maria of Portugal, commanded by Sir Charles Napier (q. v.), and that of Dom Miguel, in which a portion of the latter was destroyed, and the rest captured, 5th July 1833.

SAINT VITUS DANCE. See CHOREA.

SAIS, an ancient Egyptian city, called in the hieroglyphs *Sa*, and existing at the time of the old monarchy, was situated on the right bank of the Canopic branch of the Nile, in 31° 4' N. lat. It is at present called Sa el Hagar, or Sa of the Stone, from some modern stone buildings in the neighbourhood. There are, however, no remains of temples or palaces on the site; all that remains being a wall of unburnt brick 70 feet in thickness, perhaps the peribolos of the temple. Traces of the Temenos, 720 feet long, still exist, and of the citadel, but the temples and tombs which stood within the city walls have been completely stripped; many fine statues of basalt of the 26th or Saite dynasty, from this spot, being found in the different collections of Europe. S. gave its name to a nome, and also to two Egyptian dynasties, the 24th and 26th, founded by natives of the city. The goddesses principally worshipped there were Neith or Minerva, and Ceres or Isis. Neith was said to be the mother of the sun, and is constantly called in the hieroglyphical legends the mistress of S.; and an inscription in the temple of Neith is said to have declared of her, 'I am past, present, and future, no one has lifted my veil, the fruit I have brought forth is the sun.' At S. there was also a sepulchre of Osiris. The tombs of the kings, contrary to Egyptian and resembling the Greek custom, were within the walls. The tomb of Amasis consisted of a stone edifice with columns, and a chamber with doors. S. was important as a religious capital. Towards the decline of the monarchy, it rose to great splendour. The 26th dynasty transferred hither the capital of the kingdom. Amasis transported a monolithic shrine of granite from Elephantine to S. after three years' labour, employing 2000 men in the undertaking. Solon and Pythagoras visited S., and Plato was instructed in its colleges. There seems to have been a considerable Greek population in the city; but although S. continues to be mentioned after the 26th dynasty, its political importance then declined, and Memphis became the seat of government. The intercourse

between S. and Athens subsequently gave rise to the idea of Athens having been colonised from S. Lepsius, *Briefe*, p. 12; Wilkinson, *Modern Egypt*, vol. i. p. 183; Herodot. ii. 28, 59, 169; Strabo, iii. p. 801; Champollion, *L'Egypte*, ii. p. 219; Lepsius, p. 50.

S'AIVAS is the name of one of the three great divisions of Hindu sects. See INDIA. The word designates the votaries of S'iva, and comprises different special sects, which varied in number at different periods of medieval Hinduism. To judge by the number of shrines dedicated to S'iva in his form of Linga, it would seem that the worship of this deity was the most prevalent of all the modes of adoration; but these temples are scarcely ever the resort of numerous votaries, and they are regarded with comparatively little veneration by the Hindus. In Upper India, the worship of S'iva has, indeed, not assumed a popular form. No legends are recorded of this deity of a poetic or pleasing character. The S., unlike the Vaishnavas, have no works in any of the common dialects, such as the *Rāmāyana*, the *Vārāṇasī*, or the *Bhaktamāla*; no establishments in Hindustan, like S'rīnāth or Puri; and their teachers of repute, like S'ankara (q. v.), are too philosophical and speculative to be really popular. The worship of S'iva seems, therefore, to have been, from a remote period, more that of the learned and specialist classes, than that of the masses of the people. Its renowned work called the *S'ankara-dig-vijaya*, the victory of S'ankara over the world, composed by Anandagiri, one of the disciples of S'ankara, several subdivisions of the S. are named—viz. the S., properly so called—who wore the impression of the Linga on both arms—the *Raudras*, who had a trident stamped on the forehead; the *Ugras*, who had the drum of S'iva on their arms; the *Bhāktas*, with an impression of the Linga on their foreheads; the *Jangamas*, who carried a figure of the Linga on their head; and the *Pāśupatas*, who imprinted the same symbol on the forehead, breast, navel, and arms. The present divisions of the S., however, are the following: the *Dan'dīns* or *Das'nāmi-Dandīns*; the *Yogīns*; the *Jangamas*; the *Paramahansas*; the *Aghorīns*; the *Urdhahansas*; the *Ākās'mukhīns* and *Nakhīns*; the *Gōḍaras*; the *Rūkharas*, *Sūkharas*, and *Ūkharas*; the *Kīrāṇīns*; the *Brahmachārīns*; and the *Nāgas*.

The *Dan'dīns*, or staff-bearers, properly so called, are the representatives of the fourth order, the mendicant life, into which a Hindu is to enter when he passed through the stages of a religious student, householder, and hermit. The *Dan'dīn* is distinguished by carrying a *dan'd'a*, or small staff with several projections from it, and a piece of cloth dyed with red ochre—in which the Brahman's cord is supposed to be enshrined—attached to it. He shaves his hair and beard, wears only a cloth round his loins, and subsists upon food obtained ready-dressed from the houses of the Brahmins once a day only, which he deposits in the small clay pot that he always carries with him. He should be alone, and near to, but not within a city; the latter rule, however, is rarely observed. The genuine *Dan'dīn* is not necessarily of the Sakti sect; but those who worship S'iva, especially in the form as Bhairava, or the Terrific, have, at the ceremony of initiation, a small incision made on the inner part of the knee, the blood drawn by the process being deemed an acceptable offering to the god. The *Das'nāmi-Dan'dīns* are included in this class; but they admit none but Brahmins into their body, and are considered to be the descendants of the original members of the fraternity, who trace their origin to the celebrated *S'ankara* or *S'ankarā*.

dhrya (q. v.). He is said to have had four disciples, who are called Padmapāda, Hastāmālaka, Sureśwara or Mandana, and Trōtāka. Of these, the first had two pupils, Tirtha and Ās'rama; the second two, Vana and Aranya; the third had three, Saraswati, Puri, and Bhārati; and the fourth had also three, Jiri or Gir, Pārvata, and Sāgara. These ten constitute collectively the Das'nāmi (from *das'an*, ten, and *na'man*, name); and when a Brahman enters into either class, he attaches to his denomination that of the class of which he becomes a member; as Tirtha, Giri, &c. The philosophical tenets of this sect are mainly those of the *Vedānta* (q. v.), as taught by S'ankara and his disciples; but they generally superadd the practice of the *Yoga* (q. v.), and many of them have adopted the doctrines of the *Tantras* (q. v.).

The *Yogins* are, properly speaking, followers of the *Yoga* (q. v.) system; and the term implies a class of men who practise the most difficult austerities, in order to become absorbed into the universal spirit, and thus liberated from repeated births. The theories of S'iva, so called, hold that, by dint of these practices—such as continued suppressions of respirations, sitting in 84 different attitudes, fixing the eyes on the top of the nose—they will be finally united with S'iva, whom they consider as the source and essence of all creation. The principal sect of this class is that of the *Kānp'hātā Yogins*, who trace their origin to a teacher named *Gorakhdh*, who seems to have lived in the beginning of the 15th c., and, according to his followers, as an incarnation of S'iva. A temple of Gorakhdh exists at Gorakhpur; a plain, called *Gokshkhetr*, is near *Dwārakā*, and a cavern of his name at *Haridwar*. The *Yogins* of *Gorakhnāth* are called *Kānp'hātās*, from having their ears bored and rings inserted in them at the time of their initiation. They may be of any caste; they live as ascetics, single or in colleges; officiate as priests of S'iva in some places; mark the forehead with a transverse line of ashes, and smear the body with the same substance; they deal in fortune-telling, profess to cure diseases with drugs and spells; and some play and sing, and exhibit animals.

The *Jangamas*, or *Lingavats*, are likewise not an important division of the Saiva sect. Their essential characteristic is the wearing of the *Linga* emblem on some part of their dress or person.

The *Paramahansas* are ascetics who pretend to be equally indifferent to pleasure or pain, sensible of heat or cold, and incapable of satiety or want. In proof of this, they go naked in all weathers, never indicate any natural want, and receive from their attendants what is brought to them as their alms or food.

The same apparent worldly indifference characterises the *Aghorins*; but they seek occasions for display, and demand alms as a reward for its exhibition. Their practices, too, seem to betray that originally their worship was not of an inoffensive kind, but required even human victims for its performance. They eat and drink whatever is given to them, even ordure and carrion; and in order to extort money from the credulous, they resort to the most disgusting devices.

The *Urdhavadhus* are solitary mendicants; they extend one or both arms above their heads till they remain of themselves thus elevated. They also lose the fist, and the nails being suffered to grow, completely perforate the hand. They usually assume the S'iva marks, and twist their hair so as to project from the forehead, in imitation of the matted hair of S'iva.

The *Ābda'muktins* hold up their faces to the sky;

till the muscles of the back of the neck become contracted and retain it in that position.

The peculiarities of the other sects we cannot afford space to specify; they are equally trifling, and sometimes disgusting.—For fuller details on the Saivas, see H. H. Wilson, *A Sketch of the Religious Sects of the Hindus*; Works, vol. i. (edited by Dr R. Rost, Lond. 1862), pp. 188, ff.

S'ĀKA. See S'ĀLIVĀHANA.

S'ĀKAT'ĀYANA is the name of a celebrated Hindu grammarian, who preceded Pānini (q. v.) and Yāska (see NĪRUKTA), for he is quoted by both these authors. His grammatical work, however, seems to be lost, for no portion of it has as yet been forthcoming; and an attempt recently made to identify with it a grammar of a S'ākat'āyana, copies of which are met with at the India Office Library, London, and at Madras, has signally failed. The latter S'ākat'āyana is a Jaina (q. v.), who is not only later than Kātyāyana (q. v.), but, in all probability, a modern writer.

SAKHALIN, commonly written SAGHALIEN, native name TARAIKA, a long and narrow island, runs from north to south close off the shores of Asiatic Russia, in the south-west of the Sea of Ochotsk. In 1857 Russia took the northern part of the island from the Chinese; and in the summer of 1871, the southern end, from Japan. The estimated area is 47,600 square miles. Pop. (1872) 13,000. It is 588 miles in length, and about 120 miles in extreme breadth. Lat. 45° 54'—54° 24' N. In lat. 52° the island approaches to within six miles of the mainland, from which it is separated by the shallow Mamia Strait. A mountain-chain with craggy summits, which in lat. 52° are covered with snow throughout the year, traverses the island from north to south. There are no important natural harbours. The chief rivers are the Ty, falling into Patience Gulf, and 90 feet wide and 7 feet deep at its mouth, and the Tymy flowing north-east. The rivers and the coasts swarm with fine fish. Immense stores of fish are preserved in a frozen state during winter, and upon these the natives and their dogs in great part subsist. On the east coast of the island the vegetation, especially in the north, has a stunted appearance. On the west coast luxuriant grass clothes the valleys, and forests of pine, fir, birch, larch, oak, and maple trees cover the mountains. Among the animals are the reindeer, the stag, roe, elk, and musk ox. In the northern part of S. the climate is even more rigorous than at Nikolaevsk (q. v.). At Aniva Bay in the south, the coldest day in the winter of 1853—1854 shewed a temperature of —13° F. The inhabitants carry on an inconsiderable barter trade with their fish, furs, and seals. Coals have been discovered in several localities and explored by the Russians. Ravenstein's *Russians on the Amur* (Trübner & Co., Lond. 1861).

SAKHALIN ULA HOTUN, now commonly and more properly called Aigun, a town of Manchuria, on the right bank of the Amur, 14 miles below the junction of the Dzeya with that river. Lat. 50° 15' N., long. 127° 40' E. It is the chief place of the Manchu on the Amur, and is sombre in appearance, though it contains many gaily painted temples. The great quadrangle, containing the government and other buildings, is 230 yards square, and is surrounded by double rows of palisades. Paper lanterns hang across the streets, and fantastic figures—dragons, &c.—cut in paper, are fixed to poles above the shops. Millet, tobacco, and other products, are grown in the vicinity for export. Pop. 15,000.

SAKI, a kind of beer which the Japanese make

from rice. It is the common alcoholic liquor of Japan. It is clear, and has a peculiar taste, which Europeans generally reckon unpleasant. The Japanese usually heat it before drinking, and pour it into flat cups or saucers of lacquered wood. It produces a very speedy and transient intoxication.

SAKI (*Pithecia*), a genus of American monkeys, having the tail, which is not prehensile, covered with very long hair, whence they are often called *Foo-tailed Monkeys*. The head is round, and the muzzle short, the ears not unlike those of the human race. The whole body is covered with long hair.

S'AKTAS is the name of one of the great divisions of Hindu sects (see INDIA). The term is derived from the Sanscrit *s'akti*, which means 'power, energy;' but, in its special application, denotes the energy of the deity, and particularly that of the gods of the Hindu triad, Brahma, Vishn'u, and S'iva. This energy, originally spoken of as the wish or will of the Supreme Being to create the universe, and afterwards dilated upon in metaphorical and poetical speech, assumed at the Pauranik period (see *Hindu Religion* under INDIA) the form of a separate deity, thought of as the wife of the god to whom it belongs. Accordingly, Saraswati (q. v.) became the S'akti or wife of Brahman; Lakshmi (q. v.), the S'akti or wife of Vishn'u; and Devi, or Durgā, or Umā (q. v.), the S'akti or wife of S'iva. *S'akta*, properly speaking, means, therefore, a worshipper of any of these female representations of the divine power; but, in its special and usual sense, it is applied to the worshipper of the female energy or wife of S'iva alone; and the S., properly so called, are, therefore, the votaries of Durgā, or Devi, or Umā (q. v.). Since S'iva (q. v.) is the type of destruction, his energy or wife becomes still more so the type of all that is terrific; and, in consequence, her worship is based on the assumption that she can be propitiated only by practices which involve the destruction of life, and in which she herself delights. That such a worship must lead to the brutalisation, and degenerate into the grossest licentiousness, of those addicted to it, is but natural; and it will easily be understood that the S'akta religion became the worst of all forms which the various aberrations of the Hindu mind assumed. Appealing to the superstitions of the vulgar mind, it has its professors, chiefly amongst the lowest classes; and, amongst these again, it prevails especially in Bengal, where it is cultivated with practices even scarcely known in most other provinces. The works from which the tenets and rites of this religion are derived, are known by the collective term of *Tantras* (q. v.), but as in some of these works the ritual enjoined does not comprehend all the impure practices which are recommended in others, the sect became divided into two leading branches, the *Dakshināchārins* and *Vāmāchārins*, or the followers of the right-hand and left-hand ritual.

The *Dakshināchārins* are the more respectable of the two. They profess, indeed, to possess a ritual as pure as that of the Vedas. Nevertheless, they annually decapitate a number of helpless animals, especially kids, and in some cases pommel the animal to death with their fists, or offer blood without destroying life—practices contrary to the Vedic ritual. The *Vāmāchārins*, on the other hand—the type of the S.—and amongst these especially that branch called *Kaula* or *Kulīna*, adopt a ritual of the grossest impurities. Their object is, by reverencing Devi, who is one with S'iva, to obtain supernatural powers in this life, and to be identified after death with S'iva and his consort. 'According

to the immediate object of the worshipper,' Professor Wilson says, 'is the particular form of worship; but all the forms require the use of some or all of the five letters M—viz., Māna, Matsya, Madya, Maithuna, and Mudrā—i. e., flesh, fish, wine, women, and certain mystical gesticulations. Suitable mantras (or formulas) are also indispensable, according to the end proposed, consisting of various unmeaning monosyllabic combinations of letters, of great imaginary efficacy. Where the object of the ceremony is to acquire an interview with, and control over, impure spirits, a dead body is necessary. The adept is also to be alone, at midnight, in a cemetery or place where bodies are burned or buried, or criminals executed; seated on the corpse, he is to perform the usual offerings, and if he does so without fear, the Bhūtas, the Yoginis, and other male or female goblins, become his slaves. In this, and many of the observances practised, solitude is enjoined; but all the principal ceremonies comprehend the worship of S'akti, and require for that purpose the presence of a female as the living representative and type of the goddess. This worship is mostly celebrated in a mixed society, the men of which represent Bhairava (or S'iva as the Terrific), and the women, Bhairavi (S'akti or Devi as the Terrific). The S'akti is personated by a naked female, to whom meat and wine are offered, and then distributed amongst the assistants; the recitation of various Mantras and texts, and the performance of the Mudrā, or gesticulations with the fingers, accompanying the different stages of the ceremony; and it is terminated with the most scandalous orgies amongst the votaries.' The same author adds that, 'in justice to the doctrines of the sect, it is to be observed, that these practices, if instituted merely for sensual gratification, are held to be as illicit and reprehensible as in any other branch of the Hindu faith;' but full assent must be given to his remark which follows a text quoted by him in support of this view, for he says: 'It is only to be added that if the promulgators of these doctrines were sincere, which is far from impossible, they must have been filled with a strange frenzy, and have been strangely ignorant of human nature.'

The members of this sect are very numerous, especially amongst the Brahmanical caste; all classes are, however, admissible, and equal at the ceremonies of the sect. The particular insignia of these S'aktas are a semicircular line or lines on the forehead of red sanders or vermillion, or a red streak up the middle of the forehead, with a circular spot of red at the root of the nose. They use a rosary made of the seeds of the eleocarpus, or of coral beads, but of no greater length than may be concealed in the hand; or they keep it in a small purse, or a bag of red cloth. In worshipping, they wear a piece of red silk round the loins, and decorate themselves with garlands of crimson flowers. Two other sects are likewise mentioned as belonging to the S., the *Kāñchulliyas* and *Kardrias*, but it is doubtful whether they are still in existence. The former are said to have belonged to the south of India; and the latter seem to have been worshippers of Devi in her terrific forms, the offering to her of human sacrifices being the principal feature of their ritual. If there are still any votaries of this sect, Professor Wilson believes that they are the miscreants rather more for pay than devotion, at certain festivals inflict upon themselves bodily tortures, such as piercing their flesh with hooks or spits, reclining upon beds of spikes, gashing themselves with knives, &c.—See H. H. Wilson, *A Sketch of the Religious Sects of the Hindus*; Works, vol. i. (edited by Dr R. Rost, 1862), pp. 240, ff.

S'AKUNTALA is one of the most pleasing

female characters of Hindu mythology. She is mentioned as a water-nymph in the *Yajurveda* (see *Veda*); she is the subject of a beautiful episode of the *Mahābhārata* (q. v.), and is spoken of in the *Purāṇas*; but her name has become especially familiar in Europe through the celebrated drama of Kālidāsa (q. v.), which, introduced to us by Sir William Jones in 1789, became the starting-point of Sanscrit philology in Europe. The principal features of the legend of S., as narrated in the *Mahābhārata*, are the following: S. was the daughter of the saint Viśva-mitra (q. v.) and the Aparas, or water-nymph, Menakā. Abandoned by her parents, she was adopted by the saint Kan'wa, who brought her up in his hermitage as his daughter. Once upon a time, King Duśhyanta went a-hunting in the forest, and accidentally coming to the hermitage of Kan'wa, saw S., and fell in love with her. He persuaded her to marry him according to the rite of the Gandharva marriage, and promised her that the son she would bear him should be the heir to his throne, and that he would take her home as his queen to his royal city. Kan'wa, who had been absent while this event happened, returned to the hermitage, and through his divine knowledge, knew the whole secret, though it had not been confessed to him by Śakuntalā. She in due time was delivered of a son, and remained at the hermitage until the boy was six years old; but as Duśhyanta, unmindful of his promise, did not send any messenger for her, Kan'wa directed her to proceed with her boy to the residence of Duśhyanta. This she did; but when she arrived at his residence, she was repudiated by the king. Nor did her speech, however touching and eloquent, move his heart, until at last a heavenly voice assured him that S. had spoken the truth, and that he saw before him his lawful son. Thereupon, Duśhyanta recognised S. as his queen, and her son as his heir. The latter was named Bharata, and became the founder of the glorious race of the Kāśātās. In the drama, Kālidāsa's genius had all scope to work out the incidents of this legend, so as to display the accomplished female character of S., and likewise to shew that the obstacle which rose to her recognition was not the fault of Duśhyanta, but the consequence of a curse which S. had incurred from a wrathful saint who, when once on a visit to Kan'wa's hermitage, had considered himself neglected by her. Since, in the drama, Duśhyanta recognises S. by means of a ring he had given her at the hermitage, the name of the drama is *Abhijñāna-Sakuntalā*, or 'the drama in which Śakuntalā (is remembered) by a token.' There are no versions in which this drama now exists—older and a more recent one. The latter was first edited at Calcutta, 1761, then at Paris, 1830, by L. Chézy, who also gave a French translation of it; later and better editions of it (Cal. 1860 and 1864) were prepared by the Pandit Prem Chunder Arkabāgish, under the superintendence of Professor Edward B. Cowell, the Principal of the Sanscrit College at Calcutta. The older version has been edited by Dr O. Boettlingk (Bonn, 1842), by Professor M. Williams (Hertford, 1853), and by a Bombay Pandit at the Induprakāśa press (Bomb. 1861). The first English translation of it is that by Sir William Jones (Cal. 1789); the second was made by Professor M. Williams (Hertford, 1856); it deserves the highest acknowledgment, on account of the accurate taste with which it has rendered the metrical part of the original. Among the various German, Italian, Danish, and other translations of this drama, the German translation by Ernst Meyer (Stutt., 1852) is worthy of especial notice.

SĀKYAMUNI, or the SAINT SĀKYA, is a

name of the Buddha, the founder of the Buddhist religion. See BUDDHISM.

SĀL. *Vateria robusta*, a tree of the natural order *Dipterocarpaceae*, one of the most valuable timber trees of India. Great sal forests exist along the southern base of the Himalaya Mountains, but in many places they have been nearly cut down. The care of government is now extended to their preservation.

SĀLĀM *Salām*, Arab. = Heb. *Shalom*, peace), the general term of salutation among the Mohammedans. They are generally very formal in their social manners, although their demeanour and conversation are unrestrained enough, both among men and women. Several of their social usages in this respect are founded upon religious precepts; among these is the custom of greeting each other with the words: 'Es-selāmn aleikum'. 'Peace be with you,' which is answered by: 'With you be peace, and the mercy of God, and His blessings!' This salutation is neither to be addressed to nor to be received from any non-Mohammedan. The reply, when one Moslem salutes another, is obligatory, while the address itself is rather arbitrary. Should the saluted refuse to reply, then the other may revoke his salutation, as he does in the case of his discovery that the person saluted is not a true believer, with the words: 'Peace be on us and on all the righteous worshippers of God.' Generally, the rider salutes the person on foot, the passer-by those who sit down or stand still; the smaller party salutes the larger, the young the older, &c. Salutation is to be the first and the last thing on entering a house. The following is the rising scale of the different modes of obeisance with the Moslem: 1. Placing the right hand upon the breast; 2. Touching the lips and the forehead (or forehead and turban only) with the right hand; 3. Doing the same, but slightly inclining the head during that action; 4. The same, but inclining the body also; 5. The same, previously touching the ground with the right hand; 6. Kissing the hand of the person to whom the obeisance is paid; 7. Kissing his sleeve; 8. Kissing the skirt of his clothing; 9. Kissing his feet; 10. Kissing the ground. This, however, is to be understood (against De Sacy) as merely touching the ground previous to touching the lips and forehead with the right hand. The first five modes are accompanied by the 'Peace be with you,' and the reply given above. The sixth mode is observed by servants or pupils to their master, wife to husband, and children to father, and sometimes mother, by the young to the aged, and the less learned to the learned and pious (Lane, *Notes to Arab. Nights*, &c.).

SĀ'LĀD, the name given to a preparation of raw herbs for food. It derives its name from the fact that salt is one of the chief ingredients used in dressing a salad. The principal salad herbs are lettuce, endive, chicory, celery, mustard, and cress; water-cress, onions, radishes, chervil, and a few savory herbs used to give flavour. They are usually cut up, and mixed with salt, vinegar, oil, and other condiments, according to taste. Sugar is also frequently added. Cresses, seed-leaves of mustard, &c., are often eaten without any addition. Salad has always been a favourite food with civilised nations, and has very little varied in its composition. The Romans used it, and made it thus: Cultivated endive was cut small after careful washing and draining, then gravy and oil were poured over it; and finely-minced onions were strewed over the whole; then a little vinegar and honey was added, and the salad served up. The great value of salads is in the fact that they are un-

and consequently contain a larger quantity of mineral matter, such as potash, soda, &c., than if boiled. Salads are sometimes prepared with animal food, such as boiled lobsters, crabs, eggs, &c.

SALADIN, the name given by western writers to **SALAH-ED-DIN YUSSUF IBN AYUB**, the sultan of Egypt and Syria, and the founder of the Ayubite dynasty in those countries. As the great Moslem hero of the third crusade, and the beau-ideal of Moslem chivalry; he is one of the most interesting characters presented to us by the history of that period. He belonged to the Kurdish tribe of Ravad, and was born at Tekreit (a town on the Tigris, of which his father Ayub was *kutwal* or governor under the Seljuks) in 1137. Following the example of his father and uncle, he entered the service of Noureddin (q. v.), prince of Syria, and accompanied his uncle in his various expeditions to Egypt in command of Noureddin's army. S. was at this time much addicted to wine and gambling, and it was not till, at the head of a small detachment of the Syrian army, he was beleaguered in Alexandria by the combined Christians of Palestine and Egyptians, that he gave indications of possessing the qualities requisite for a great captain. On the death of his uncle, Shirkoh, S. became grand-vizier of the Fatimite calif, and received the title of *El-melek-el-naar*, 'the Victorious Prince'; but the Christians of Syria and Palestine, alarmed at the elevation of a Syrian emir to supreme power in Egypt, made a combined and vigorous attack on the new vizier. S. foiled them at Damietta, and transferred the contest to Palestine, taking several fortresses, and defeating his assailants near Gaza; but about the same time his new-born power was exposed to a still more formidable danger from his master, Noureddin, whose jealousy of the talents and ambition of his able young lieutenant, required all the skill and wariness at S.'s command to allay. On Noureddin's death, in 1174, S. began a struggle with his successor, which ended in his establishing himself as the sultan of Egypt and Syria, a title which was confirmed to him by the calif of Bagdad. The next ten years were occupied in petty wars with the Christians, and in the arrangement and consolidation of his now extensive dominion. The plundering by the Christians of a rich pilgrim caravan on its way to Mecca, an infringement of the treaty with S., brought down upon them the latter's vengeance; their army suffered a dreadful defeat at Tiberias (4th July 1187); the king of Jerusalem, the two grand-masters, and many other warriors of high rank were taken captive; Jerusalem was stormed (2d October), and almost every other fortified place in Palestine was taken. The news of this great success of the infidels being brought to Western Europe, aroused the enthusiasm of the Christians to its highest pitch, and a powerful army of crusaders, headed by the kings of France and England, speedily made their appearance on the scene of strife. They captured Acre in 1191, and Richard Cœur-de-Lion, at the head of that portion of the crusading army which adhered to him, continued the war with success, twice defeated S., took Cæsarea and Jaffa, and finally obtained a treaty for three years (August 1192), by which the coast from Jaffa to Tyre was yielded to the Christians. In the following year, S. died at Damascus of a disease under which he had long suffered. S. was not a mere soldier; his wise administration left behind it traces which endured for centuries; and the citadel of Cairo and sundry canals, dikes, and roads are existing evidences of his careful attention to the wants of his subjects. In him the warrior instinct of the Kurd was united to a high intelligence; and even his opponents frankly attribute to him the

noblest qualities of medieval chivalry, invincible courage, inviolable fidelity to treaties, greatness of soul, piety, justice, and moderation.

The Ayubite dynasty of which he was the founder ruled over Syria till 1259, when it was dispossessed by the Perso-Mongols, and over Egypt till the rise of the first Mameluke kingdom under Ibrâhîm in 1250.

SALAMA'NCA, one of the three modern provinces of Spain, into which the ancient kingdom of Leon (q. v.) was divided. Area about 4940 sq. m., pop. (1870) 280,870.

SALAMANCA, a famous town of Spain, capital of the modern province of the same name, stands on three rocky hills on the right bank of the Tormes, 50 miles east-north-east of Ciudad Rodrigo. Prior to its almost total destruction by the French in 1812, it was renowned for the number of its splendid edifices and institutions, and even yet it is a rich mine for the architect, abounding as it does in magnificent specimens of simple and florid Gothic, as well as of the richest cinque-cento. It is surrounded by a wall, pierced with nine gates, and a part of which is very old. The narrow, crooked, dark, and steep streets, containing many old and stately structures, the residences of the old nobility, give to the town an antique and venerable look. Besides the old cathedral, a simple and massive edifice, it contains five other churches of the 12th century. The new cathedral, begun in 1513, is a magnificent structure in florid Gothic; the adornment of which painting, gilding, and sculpture have been largely and most successfully used. At the close of the 18th c., S. contained 7 parish churches, 39 convents, and 25 colleges. Of the colleges, 20 were destroyed by the French when the town was in their possession, as well as about 20 of the convents, for the purpose of obtaining materials for the erection of fortifications, and for firewood. The university of S., with which the university of Palencia (q. v.) was incorporated in 1243, was founded in 1200. It consisted of a number of colleges, divided into *Mayores* and *Menores*, or larger and smaller colleges. Of the former, there were only six in Spain, and four of these were at S.; the other colleges were 21 in number. In the 14th c., the university was attended by 17,000 students; the attendance is now only 200. The library, according to the most recent statement, contains 30,000 volumes and 1500 MSS. The school of S. is interesting to British subjects in having, from an early period, included a college of Irish students, which supplied many of the ecclesiastics who continued to minister to their countrymen during the penal times, and which is still in existence. One of the most highly-prized works of Roman Catholic divinity is the great collective *Controversial and Moral Theology*, by the members of the college of Carmelite friars in S., who are known by the name of *Salmantenses*, or the *Salamanca Theologians*. The *Plaza Mayor* is the largest square in Spain, and when fitted up as a bull arena as it was so recently as 1863, it accommodates from 16,000 to 20,000 persons. The bridge across the Tormes rests on 27 arches, and is of Roman foundation. Manufactures of cloth, leather, and earthenware are carried on. Pop. 14,000.

S., the ancient *Salamanca*, was a Roman *sempiternum*. In the vicinity was won one of the most famous victories of the Peninsular War, by the British under Wellington against the French under Marmont, 22d July 1812.

SALAMANDER, in the superstitions of the middle ages, denoted a being possessing the qualities of a man, whose element was the fire, or who is

least could live in that element. Paracelsus placed salamanders among the elementary spirits.

SALAMANDER (*Salamandra*), a genus of Batrachians, of the family *Salamandridæ*, to which Newts (q. v.) also belong. The name is, indeed, sometimes extended to the whole family; newts being called *Aquatic Salamanders*, and the name *Terrestrial S.* being given to this genus, the species of which inhabit water only in their tadpole state, and return to it only to deposit their eggs, generally living in moist places, as under stones, roots of trees, &c. The general form is very similar to that of newts, but the tail is round, not flat as in newts. Several species are found in Europe; none of them, however, in Britain. The **SPOTTED S.** (*S. maculosa*), six or eight inches long, black, with bright yellow

Spotted Salamander (*S. maculosa*).

stripes on its sides, and livid blue beneath, is widely spread throughout Europe. The **BLACK S.** (*S. atra*) is much smaller, black, the body and tail ringed, the tail almost as if formed of beads. It is abundant in the Alps and mountains of Southern Germany. Other species are found in Spain, Italy, &c.; Asia and North America also produce numerous species. Salamanders feed on worms, slugs, snails, and insects. They are inert and sluggish creatures, and timid to the utmost extent that their stupidity permits. The brain is very small. They are perfectly harmless, although exuding, when alarmed, from pores on the back and sides, a milky humour, which is injurious to very small animals. But they have long had, and still retain, a popular reputation of extreme venomousness, and are therefore objects of the utmost dread to the vulgar in almost all countries which they inhabit. Strange fables have been current concerning them from remote ages, particularly concerning the icy cold which envelops their body, and enables them not only to endure fire without burning, but to extinguish fire. Pliny, indeed, records that he tried the experiment, and the poor *S.* was burned to powder; yet the fable continued to be credited until very recent times.

SALAMIS (modern name, *Koluri*), in ancient times called also *Pityoussa* (Island of Pines), an irregularly-shaped, mountainous island of Greece, off the coast of Attica, and forming with it the Bay of Eleusis. Its area is about 30 sq. m., and it has a modern population of about 4000, the chief town being *Koluri*, on the west coast. It had anciently two principal towns, Old and New Salamis, the former on the south, and the latter on the north-east coast. *S.* is remembered chiefly on account of the great naval battle between the Greeks and Persians, which was fought (480 B.C.) a few days after the battle of Thermopylae, in the narrow strait between the east coast of *S.* and the west coast of Attica. The Grecian fleet, consisting of about 360 vessels, was drawn up at the entrance of the bay forming the harbour of New Salamis, Themistocles being leader of the Athenian

contingent, and Adimantus of the Corinthian, while the whole was under the command of the Spartan Eurybiades. Great dissensions prevailed among the Grecian leaders, which would probably have led to a general break-up, had not Themistocles by a stratagem induced Xerxes, king of the Persians, to bring up his fleet, and give immediate battle to the Greeks. Xerxes drew up his ships, numbering at least 1000, during the night previous to the battle, opposite the Grecian fleet, along the coast of Attica, almost completely blocking up both entrances to the straits; and confident of victory if he himself superintended operations, he took his seat on a throne erected on a lofty height on the Attic coast, almost opposite New Salamis. Both Greeks and Persians fought with great bravery, but the latter were entirely defeated, owing, perhaps, chiefly to their immense, unwieldy fleet being compressed into so small a space, which rendered it almost unworkable, and completely at the mercy of their opponents. The only name mentioned on the Persian side with distinction is that of Artemisia, queen of Halicarnassus, who is said to have fought with desperate bravery. The loss of the Greeks is said to have been 40, and that of the Persians 200 ships, exclusive of those which were captured.

SAL AMMO'NIAC (known in Chemistry as **HYDROCHLORATE OF AMMONIA**) is an article of considerable importance in the *Materia Medica*. It is obtained on a large scale by decomposing with common salt (chloride of sodium) the sulphate of ammonia, which is formed in the manufacture of coal gas, or the carbonate of ammonia, obtained by the distillation of bones. It is sold in large, crystalline, grayish-white, semi-transparent cakes, convex on one side, and concave on the other. It is inodorous, but possesses an acrid, bitter, and nauseous taste. Its specific gravity is 1.45; it volatilises without decomposition when heated, and is freely soluble in water. Its aqueous solution, when heated with caustic potash, evolves gaseous ammonia; and when treated with nitrate of silver, yields a white, curdy precipitate of chloride of silver. This salt is largely given in France and Germany in cases of pneumonia and of inflammation of the serous membranes, in mucous diarrhoea, in chronic rheumatism and gout, and in passive dropsies. Neligan recommends it in cases of low fever, in subacute laryngitis, in chronic affections of the liver, and in facial neuralgia. It may be given in doses varying from 10 to 30 grains, dissolved in some aromatic water. As a local external application, it is of great value in promoting the absorption of effused blood; and there is probably no remedy so effectual for that common but disfiguring affection popularly known as a *black eye*, as a moderately strong solution of this salt, kept constantly applied as a lotion. If it is desired to apply cold to any part of the body, an excellent Refrigerant (q. v.) may be obtained by dissolving five parts of this salt and five parts of nitre in sixteen parts of water.

S. A. is employed for various purposes in the arts. It is used in soldering, and in the tinning of copper and iron to prevent the oxidation of the surface to be tinned. It is exported from Britain to Russia, where it is used by dyers.

It occurs as a mineral, as an efflorescence on the surface of rocks, or as a sublimate in fissures, crystallised in small crystals, or forming crusts, stalactites, &c. It is found in volcanic regions, but is produced during the time of the quiescence of active volcanoes, rather than during their eruptions. It occurs in Britain, near burning beds of coal. It is found in Persia, Tartary, Siberia, and many other countries, where there are no active volcanoes.

SALDANHA BAY—SALE OF LAND.

Formerly, all Europe was supplied with it from the neighbourhood of the temple of Jupiter Ammon in Egypt, whence its name.

SALDANHA BAY. See **CAPE OF GOOD HOPE.**

SALE, GEORGE, an eminent oriental scholar, was born towards the end of the 17th c., and died at London in 1736 under forty years of age. Almost nothing is known of his private life. He is supposed to have been born in Kent; and he received his education at the King's College, Canterbury. Brought up to the law, he is believed to have practised it almost to the end of his life. That he spent five-and-twenty years in Arabia, as Voltaire and many after him asserted, is a complete fiction. He assisted in getting up the *Universal History*—together with Swinton, Shelvocke, Campbell, George Psalmanazar, and A. Bower, each remarkable enough in his way—for which he wrote the cosmogony and several portions of oriental history. He was also one of the authors of the *General Dictionary*; but he is best known by his unrivalled translation of the Koran, 'with explanatory notes taken from the most approved commentators, to which is prefixed a preliminary discourse' (1734). This 'preliminary discourse,' which is of great value, and proves S. to have been deeply versed in oriental literature, treats, among other things, 'of the Arabs before Mohammed, or, as they express it, in the "time of ignorance"—their history, religion, learning, and customs; of the state of Christianity, particularly of the Eastern churches, and of Judaism, at the time of Mohammed's appearance; and of the methods taken by him for establishing his religion, and the circumstances which concurred thereto; of the doctrines, precepts, and peculiarities of the Koran, and of the principal Mohammedan sects.' S.'s work was translated into French by Duryer (Antw. 2 vols. 1770). This translation formed a new epoch in the study of Islam and its literature; and though many other translations have been attempted since, in nearly all European and oriental languages, it still bears the palm. See **KORAN**. That his contemporaries fastened the charge of heresy upon one who spoke philosophically and humanely of other creeds, is not to be wondered at. After his death, a catalogue of his oriental MSS. was published, and the contents are now in the Radcliffe Library, Oxford.

SALEM, a town in the south of India, capital of the collectorate of the same name. The collectorate is the chief seat of the Indian *steel manufacture*—a branch of industry as curious as it is ancient. The town stands in an elevated valley, 1070 feet above sea-level, bounded on the north and south with hills, 193 miles south-west of Madras. It is well built, contains a number of handsome two-storied houses, and is surrounded by land in a high state of cultivation. Cotton is grown in the vicinity in quantity more than sufficient for the use of the numerous cotton weavers, who, together with the silk weavers, form the great mass of the non-agricultural inhabitants of the town. Pop. 19,000.

SALEM, a city and port of entry of Massachusetts, U.S., 14 miles north-east of Boston, on a peninsula 2 miles long by $\frac{1}{2}$ th of a mile broad, with irregular but well-built streets, and a fine harbour, from which was formerly carried on a large trade with China, the East Indies, and Eastern Africa. The principal institutions of S. are: the East India Marine Society, whose extensive and unique museum of oriental curiosities is now united with that of the Peabody Academy of Science; the Essex Institute, with a library of 18,000 vols., and a picture-gallery; and the Salem Athenæum with a library of 13,000 vols. There is a normal and

grammar school, 6 newspapers, 7 banks, 21 churches, a cotton-mill, with 65,000 spindles, and manufacture of chemicals, varnishes, leather, shoes, machinery, &c. S. was settled in 1626, and is the oldest town except Plymouth, in New England. The first church was organised in 1629. In 1692, a great witch-mania broke out, and 19 persons were hung for 'witchcraft.' In the war of the revolution, S. sent out 153 privateers, which took 455 prizes. Pop. in 1860, 22,252; in 1870, 24,117.

SALE OF GOODS is a contract by which the seller, in consideration of a price, transfers the property in the goods to the purchaser. Where the consideration is not money but goods, the contract is called exchange or barter. The law on the subject is not the same in England and Scotland. In England, when the bargain is struck, and the sale relates to specific goods—that is, goods already made, and existing, and identified—the property vests at once in the purchaser, so that in the event of any damage or destruction happening to the goods, the loss is that of the purchaser and not of the seller, even though the goods have not been delivered, as, whether the price has been paid or not. The contract may be made either by word of mouth or by writing; but when the price exceeds £10, the statute of Frauds enacts that the contract shall not be binding unless it is in writing. If, however, the buyer shall have accepted part of the goods, or actually received the same, or if he shall have given something in earnest to bind the bargain, or in part payment, then a verbal contract will be binding though the price exceeds £10. Many nice questions have occurred and constantly recur as to what amounts to an acceptance and delivery of the goods so much so, that the general policy of restricting the proof of the contract to writing in any case has been much complained of in late years; and efforts have been made, but as yet in vain, to repeal the statute of Frauds, which, it is said, encourages rather than discourages fraud. When a contract of sale is made, the duty of the seller is to deliver the goods as soon as the buyer has performed all the conditions agreed upon. If no time was specified for delivery, then he must deliver the goods in a reasonable time. It is general, if nothing is agreed to the contrary, that the seller need not deliver till the price is paid; but he must do so if the bargain was, that delivery was to take place before payment, in other words, if the sale was on credit. On the other hand, it is the duty of the buyer to accept the goods and pay for them. If either party fail at any stage in his performance of the duties arising out of the contract, the other may bring an action which varies according to the nature of the breach of contract. One valuable right of the seller, when he has sent his goods to the buyer, and they are in course of delivery, but not already delivered, is to stop them in transit. This stoppage *In Transitu* (q. v.) being chiefly resorted to when the seller hears of the bankruptcy of the buyer after he has sent away the goods.—In Scotland, the chief points of difference from the law in England as to sale are these. The rule is, that in writing whatever is necessary to make the contract binding, whether the price exceeds ten pounds or not. Again, the rule is, that the property in the goods does not pass until they are either actually or constructively delivered to the buyer.—See Paterson's *Compendium*, 2d ed. ss. 520–544.

SALE OF LAND differs from sale of goods in several respects. An agreement for the sale of land must be in writing, otherwise it cannot be enforced. When once a contract for the sale of land has been entered into, a Court of Equity will, contrary to the general rule which prevails when a contract is

broken, enforce specific performance of the contract; that is, will compel the seller or buyer to carry out his contract, and transfer or accept conveyance of the land. When a sale of land is agreed upon, and nothing is said as to the matter, it is understood, as part of the contract, that the vendor shall be able to make a good title; and a doubtful title cannot be forced on the vendee even though it is accompanied with an indemnity. The rule is, that the abstract of title—i. e., a short account of the series of former transactions relating to the possession and property—must go back for sixty years. The expense of making searches into registers during that period falls on the purchaser. It is the duty of the purchaser's solicitor to prepare the draft of the conveyance, and tender it for approval to the vendor's solicitor; and unless there is an agreement to the contrary, the purchaser pays the expense of the conveyance. When the vendor has delivered possession of the estate to the purchaser without receiving the purchase-money, he still retains a lien on the estate for the unpaid price. In England there is no general register which contains copies of all the deeds relating to land, so that everything depends on the preliminary inquiries between the two parties, and the certainty that the purchaser has obtained all the material information that exists. The consequence is, that the sixty years' title or previous history of the estate involves the parties in great expense. This expense requires to be renewed on every fresh sale, for a solicitor who neglects to go through the same train of inquiries as his predecessor at the time of the last preceding sale would be personally liable for any loss that occurred thereby. The great expense attending the conveyance of land has of late years been loudly complained of, and the manufacturing interest, familiar with the rapidity of similar transactions relating to goods, have demanded a simplification of the process. In order to meet this demand, which has been largely shared by the public in general, two acts of parliament were passed in 1862, for the purpose of founding a Land Registry, and enabling an owner of land to have his title examined and registered once for all, so that in the event of future transactions he may be saved the expense and delay required under the old system. These acts of parliament were not compulsory, and little progress was made, but the legislature has been maturing a scheme for making them compulsory in all but trifling sales of land. In Scotland, the law relating to the sale of land has always been on a more satisfactory footing, for there are registers in which an intending purchaser can with certainty find all the deeds, and nearly every burden that can attach to the land he wishes to buy; so that he can almost at a glance ascertain what are the dangers and drawbacks attending the transaction. See REGISTRATION OF DEEDS AND WRITS. In Scotland the expense of the conveyance of land falls on the vendor, if there is no agreement to the contrary, and the vendor's solicitor prepares and tenders the draft conveyance, while the purchaser pays his own solicitor for perusing and approving the draft conveyance; but in practice the expenses of conveyance are usually equally divided between vendor and purchaser.

SALEP, the tubers of many species of *Orchis* and other *Orchidææ*, dried and used as an article of food. Of the two tubers usually found at the roots of these plants, only one is gathered for salep, the younger and more solid of the two. The tubers are gathered when the stalk is about to fall. They vary from the size of a cherry-stone to that of an olive. They are cleaned, dipped for a few minutes in boiling water, and dried as quickly as possible,

by which process they are rendered hard and horny. The greater part of the salep of commerce is brought from the East, and much of it from Persia; it is supposed to be obtained from species of *Eulophia*; but most of the European species of *Orchis* are used for it.

Before coffee became so common in Britain, salep was an article of considerable importance, and large quantities were imported from Turkey, Persia, and India. In France it is still in considerable request. For use it is ground into a fine powder, and mixed with boiling water, sugar and milk being added according to taste. As a diet drink, it was considered very nutritious and wholesome, and forty years ago it was sold, ready prepared, to the working-classes of London, early in the morning, from numerous street stalls. Its principal constituents are *bassorine*, starch, and phosphate of lime.

SALE'ERNO (ancient *Salernum*), a city of Southern Italy, chief town of the province of S., on the gulf of the same name, 32 miles E.S.E. of Naples, with a population (1872) of 27,759. A Gothic wall, built of huge stones without mortar, encircles it; the streets are paved with lava, and, with the exception of the two principal ones, are narrow, irregular, and dirty. It has a strong castle, and a very small harbour. The old and beautiful Gothic cathedral was erected by the Normans, and has around it a portico of porphyry and granite pillars brought from *Pæstum* by Robert Guiscard. It has many famous sepulchres, among others, those of Robert and Guillaume Guiscard, of Margaret of Anjou, and of Gregory VII. It was celebrated in the middle ages for its school of medicine (the *Schola Salernitana*), founded by Robert Guiscard about the end of the 11th c., and which was long the first medical school in Europe. The university has fallen into decay. In its neighbourhood, which produces excellent wine, are the ruins of *Pæstum*, which was destroyed by the Saracens in the 9th century. Of ancient *Salernum* or *Salurnum*, there still exist the Temple of Neptune, that of Ceres, and the ruins of an amphitheatre and of a theatre. S. was founded by the Greeks; it became important under the Roman empire, then passed into the possession of the Goths, and of the Lombards. Robert Guiscard made himself master of it in 1076. Charles V. united it to the kingdom of Naples.

SALE'ERNO, GULF OF (anc. *Sinus Pastanæ*, on whose shores, in early times, the Greek city of *Pæstum* [q. v.] stood), is a nearly semicircular indentation on the western shores of Southern Italy, south-east of the Bay of Naples, from which it is separated by the promontory ending in Point Campanella. The Gulf is 36 miles wide at its entrance, and sweeps inland for 24 miles. On its shores are the towns of Amalfi and Salerno.

SALES, FRANCIS DE, a most distinguished saint of the Roman Catholic Church, was born August 21, 1567, at the family castle of Sales, near Annecy in Savoy. He was the heir of the family honours, and his education was designed by his father to fit him for the career of distinction to which his position seemed to entitle him. From the provincial colleges of La Roche and Annecy, he was sent to Paris in 1578, where he entered the then brilliant school of the Jesuits, and completed under their care the course of rhetoric and philosophy. In 1584, he went to Padua, for the course of civil law, and pursued his studies there with great distinction till 1591. At this time, his father, who had obtained for him a place in the senate, proposed to him a very brilliant and advantageous marriage, but he had already resolved to devote himself to the ministry, and with

SALEYER ISLANDS—SALICIN.

much difficulty obtained his father's consent to enter into orders in the diocese of Geneva. He soon became distinguished as a preacher, and the zeal with which he discharged the ordinary duties of his ministry was no less remarkable. Very soon after his ordination, he was employed by his bishop in a mission for the conversion of the Calvinistic population of Chablais, which had been recently annexed to the duchy of Savoy, and in which the duke was desirous of having the Catholic religion re-established. The success of this mission was almost unprecedented. With a companion equally devoted, he travelled on foot from town to town, and in a short time he succeeded in reclaiming many to the church. One of the most remarkable incidents of his mission was a conference with the celebrated Calvinist leader, Theodore de Beza. Of this interview, very different accounts are given by the rival partisans; but all agree in admiration of the gentleness and enlightened liberality of Francis de Sales. At the termination of this mission, Francis was, in 1596, appointed coadjutor to the Bishop of Geneva, Mgr. Granier, with the title of Bishop of Nicopolis. It was with much difficulty that the pope, Innocent IX., induced him to accept this dignity. Some time afterwards, having occasion to go to Paris, he was invited to preach the Lent in the chapel of the Louvre; and his lectures, which were partly controversial, were reputed to have had so much influence in bringing about the conversion of several of the Huguenot nobles, that the king tried to induce him to accept a French bishopric; but in vain. He returned to his diocese; and soon afterwards, on the death of Mgr. Granier, he succeeded to the bishopric of Geneva. His administration of this charge, upon which he entered in December 1602, was beyond all praise. Being again invited to preach the Lent at Dijon, in furtherance of the plans of Louis XIV. for the conversion of the Huguenots, he was again pressed by that monarch to accept a French bishopric. But he again declined this honour, as he also declined in 1607 the offer of the cardinalate from the pope Leo XI. It was about this time that he published his well-known *Introduction to a Devout Life*, which has continued to the present day one of the most popular manuals of piety and the ascetic life. Among his measures for the renovation of the monastic spirit, a very important one was the establishment of a congregation of nuns of the order of the Visitation, under the direction of the now celebrated Madame de Chantal, with whom he long maintained a correspondence on every subject connected with the spiritual and religious life, which was published in 1660, and which still remains a subject of almost undiminished interest for the spiritualist. In 1608, his infirmities compelled him to solicit the assistance of a coadjutor in the charge of his diocese. He continued, however, to labour to the last. His last sermon was delivered at Lyon on Christmas eve in 1622; on Christmas-day he was seized with paralysis, and on the 28th of the same month, he expired. He was buried in the church of the Visitation in that city, but his remains were afterwards translated to Annecy. More than forty years after his death, in 1665, he was solemnly canonised as a saint by Alexander VII. His festival is held on January 29, the day of the translation of his relics to Annecy. His works were published in a collected form in 2 vols. folio at Paris in 1641; but the separate works (especially the *Devout Life*, which has been translated into almost every European language), have passed through innumerable editions, and still retain their popularity.

SALEYER ISLANDS, THE, lie in the Indian Ocean, to the south of Celebes. Upwards of thirty

of the group are small, hilly, densely wooded, and, with few exceptions, uninhabited. Great Saleyer, in 5° 44'—6° 26' S. lat., and 120° 23'—120° 37' E. long., is upwards of 40 miles in length, and 7 in breadth, the area being 336 sq. miles. The mountains on the east coast rise abruptly out of the sea, and along the west is a slip of level land planted with cocoa-nut trees. Pop. 60,000. Great Saleyer and the smaller islands produce fine timber, including ebony and teak. Indigo, coffee, and mustard are grown; but millet, maize, earth-fruits, and cotton are the staple cultures, the grounds being carefully fenced. Agriculture is the chief employment, and fishing, making salt, &c., are also carried on. The exports are cocoa-nuts, cocoa-nut oil, cotton, and cotton fabrics. Imports—rice, gambier, tobacco, yarns, iron and copper ware. Since the Netherlands' government made Macassar a free port, sea-going ships are not permitted to anchor at Saleyer; and the trade is carried on by small vessels, which sail between that island, the Bight of Boni, Sumbawa, Bali, Borneo, Java, Macassar, &c. Singapore. The sea is rich in various kinds of fish—a long and thin species, the Saleyer, giving a name to the island.

The S. I. are governed by fourteen rajahs, superintended by a Netherlands' agent. The natives are Mohammedans, each large village having a mosque and priest. The high priest resides near the political agent, has a seat in the council, and is consulted on religious questions. Some of the rajahs and notables have tables and chairs, tea and dinner services, silver spoons and forks, mattresses, cushions, and even satin bed-curtains.

SALFORD, a municipal and parliamentary borough, Lancashire, is considered as virtually a portion of the city of Manchester (q. v.).

SALICIN ($C_{15}H_{13}O_6$) is a member of the group of organic compounds to which the term *glycosides* has been recently applied by chemists—a group which is specially characterised by the fact that each of its members, when exposed to certain chemical agencies, breaks up (usually after the absorption of water) into glucose (or grape-sugar) and other compounds. It occurs in the bark of the various species of willow and poplar, in the blossoms of several species of *spiræa*, and probably in the animal secretion known as *castoreum*. It may be obtained in small, colourless, glistening prisms of an intensely bitter taste, which are readily soluble in hot water and in alcohol, and moderately soluble in cold water, and are insoluble in ether and oil of turpentine; and its solutions exert a left-handed rotatory action upon a ray of polarised light. When heated to 248°, salicin fuses; and at a higher temperature, it is entirely decomposed. It dissolves in strong sulphuric acid, the solution being of a purple or blood colour. Salicin is manufactured to a considerable extent as a cheap substitute for quinia. There are various modes of extracting it from the macerated bark; and 1 lb. of the bark of *Salix pentandra* yields, according to Erdmann, 5 drachms of salicin. If it is not so certain in its action as a febrifuge as quinia, there can be no doubt that it is an excellent tonic; and it possesses this advantage over the latter substance, that it is less liable to irritate the stomach. Dr Neligan, in his excellent work on *Medicines*, states that he has used it very extensively as a tonic in the debility following acute diseases, particularly in cases accompanied by irritability of the digestive organs, and considers its powers to be fully equal to those of sulphate of quinia. As a tonic, two grains may be given three or four times a day; as a febrifuge, from one to two scruples in divided doses, during the

intermission. It may be prescribed as a powder mixed with sugar, or dissolved in water, with the addition of some agreeable syrup.

SALIC LAW. The code known as the *Salic Law* is a collection of the popular laws of the Salic or Salian Franks (see **FRANKS**) committed to writing in barbarous Latin in the 5th c., while the people were yet heathens. There exist several texts of this code, and considerable obscurity rests over its history. It relates principally to the compensation and punishment of crimes, and there is a chapter containing provisions regarding the succession to what are called *Salic Lands*, which seems to have been inserted at a later date. It is difficult to determine precisely what these lands were. The *terra salica* was probably so called from its being more especially attached to the *sal* or hall of the lord or proprietor (some derive *salic* as applied to the people from the same word); it thus came to designate inherited land as opposed to property acquired otherwise. Although the Frankish law did not in general exclude females, the succession to these salic lands, whatever they were, was confined to males, probably from the importance of securing the military service of the chief proprietors. It was but a doubtful analogy that led the rule of succession to Salic lands to be extended to the succession to the French crown, and it seems to have been only in the 14th c. that the exclusion of females from the throne became an established principle. The accession of Philip the Long was probably the first occasion on which it received public sanction, and the fact that Edward III. rested his claim on female succession, doubtless led to that instance being regarded as an unquestionable precedent for all future time.—See Hallam's *Europe in the Middle Ages* (ch. ii. pt. 1, and notes); Guizot, *Essai sur l'Histoire de France*, p. 94.

SALIENT, in Heraldry, an attitude of a lion or other beast, differing but slightly from *Rampant* (q. v.). He is supposed to be in the act of springing on his prey, and both paws are elevated. Two animals *counter-salient* are represented as leaping in opposite directions.

SALIENT, in Fortification, is that which points outwards from the interior of any work. For example, the central angle of a bastion, pointing towards the enemy, is a salient angle.

SALIFEROUS SYSTEM, the name given by the earlier English geologists to the New Red Sandstone (q. v.) formations, because the deposits of salt in England occur in these strata. As, however, this substance has been found associated with strata of all ages in different parts of the world, the name has been given up.

SALIFIABLE BASE, a term applied in chemistry to any substance capable of uniting with an acid to form a salt.

SALINA, or **SALINI**, one of the Lipari Islands (q. v.).

SALINE PLANTS are those which require for their healthy and vigorous growth a considerable supply of *chloride of sodium* (common salt) and other salts, and which are therefore limited to peculiar situations. Few of them are strictly aquatic plants, except the marine Algae, or Sea-weeds, which grow immersed in salt water, either always or in certain states of the tide, and derive their nourishment from it through their fronds, and not by roots from the rock to which they are attached. Grass-wrack (q. v.), however, is an instance of a phanerogamous plant living entirely and always immersed in salt-water. Other phanerogamous plants grow chiefly or only on the sea-shore and in salt marshes. Some

of these, however, as the sea-kale, may be cultivated in gardens remote from the sea, but they succeed best when liberally supplied with salt. Asparagus is another well-known garden-plant, which derives much benefit from similar treatment. Some of the Saltworts (q. v.) and other saline plants yield much soda when collected and burned, and the produce was at one time largely imported into Britain from Spain and other countries under the name of Barilla (q. v.). The dry steppes of Russia and Tartary, having in many places a strongly saline soil, are covered with a very peculiar vegetation. Among the ornaments of these steppes is *Halimodendron argenteum*, a shrub of the natural order *Leguminosae*, often cultivated in gardens for its beautiful rose-coloured flowers and silvery gray leaves. Saline plants have their whole tissues impregnated with salt.

SALINE POWDER, COMPOUND, is a very popular and harmless form of aperient medicine. The ordinary method of preparing it is by drying, at a gentle heat, and then pulverising 4 oz. of pure chloride of sodium (common salt), 4 oz. of sulphate of magnesia (Epsom salts), and 3 oz. of sulphate of potash. These salts must then be mixed and triturated together, and kept in an air-tight vessel. Two or three drachms dissolved in half a pint of water, and taken before breakfast, usually act efficiently. Dr Neligan states that if 4 oz. of sulphate of soda be used instead of the sulphate of potash, and a sufficiently high temperature be employed to expel all the water of crystallisation from the different ingredients, one drachm of the resulting compound acts as energetically as two or three drachms of the ordinary powder.

The following is a more agreeable form than the preceding, and equally efficacious. Take half an ounce of carbonate of magnesia, and an ounce of each of the following substances—viz., sulphate of magnesia, bicarbonate of soda, tartrate of soda and potash, and tartaric acid. Expel all the water of crystallisation, and mix. This powder, if kept dry, effervesces when mixed with water, and one or two teaspoonfuls form the average dose. The addition of a drop of oil of lemon and a little powdered white sugar to each dose, makes this one of the most agreeable laxatives that can be prescribed.

SALISBURY, or **NEW SARUM**, the capital of Wiltshire, is an episcopal city, and a municipal and parliamentary borough, and stands in a fertile valley on the Avon, at the junction of that river with two of its affluents, 83 miles south-west of London by the South-western Railway, and 23 miles north-west of Southampton by a branch of the same. Its several parts are connected by three bridges. The town dates from 1220, in which year the cathedral was founded, and the inhabitants of Old Sarum (see **SARUM, OLD**) two miles to the north, removed to S., attracted to the new site by the abundant supply of water. At the foundation of the town, the ground was divided into squares, or 'chequers' as they are called, to which the town is indebted for its appearance of airiness and regularity. The cathedral, the principal building of S., is one of the finest specimens of Early English in the country. It was begun in 1220, and was finished in 1258. The spire, which was added after the building was completed, is the 'most elegant in proportions and the loftiest in England.' Its height from the pavement is 400 feet, or 30 feet higher than St Paul's. The cathedral is 449 feet long; height in the interior, 81 feet; width of great transept, 203 feet. It is in the form of a double cross, is perfect in its plan and proportions, and in the main uniform in style. The west front

SALISBURY PLAIN—SALIVATION.

is still rich, beautiful, and graceful, though now denuded of statues, upwards of 100 in number, with which it was once enriched. The cathedral has been recently restored. The manufactures of cutlery and cloth, for which it was once famous, have long declined, and its trade is now chiefly in retail. Pop. (1871) 13,839. It returns two members to parliament.

SALISBURY PLAIN, an extensive tract of undulating chalk country, in Wiltshire, between Salisbury and Devizes, about 20 miles long from north to south, and about 14 miles broad. Its rolling surface resembles that of the ocean heaving after a storm. On this plain, about 8 miles north of Salisbury, is Stonehenge (q. v.). Until within recent years, the expanse of S. P. remained in a state of nature, and was covered with a fine turf, which afforded pasture to sheep. The natural features of the plain, however, are now much changed. North and south of Stonehenge, wild slopes of thistle-covered turf still extend; but both east and west of it, the country is laid out in cultivated fields; and within gun-shot of the desolate old relic, is a neat modern farm-house.

S'ĀLIVĀHANA is the name of a Hindu prince who is said to have reigned in Magadha or South Behar. He instituted an era which bears his name, and the beginning of which took place when 3179 years of the Kali-yuga, or the present mundane age, had expired; that is, 78 years after the beginning of the Christian era. This era is called S'āliyāhana S'āka, or simply S'āka. Thus 1865 of the Christian era would be tantamount to S'āka (i. e., in the S'āka era) 1787. The S'āka year is the same as, and begins with, the common solar year.

SA'LIVARY GLANDS. Under this name we designate three pairs of glands—the parotid, the submaxillary, and the sublingual, each gland having an efferent duct, which conveys the glandular secretions into the mouth, where, when mixed with the mucus secreted by the follicles of the mucous membrane lining the mouth, they constitute the ordinary or mixed saliva.

The *Parotid Gland*, so called from the Greek

The Salivary Glands.

1, the parotid gland; 2, the submaxillary gland; 3, the sublingual gland; 4, Steno's duct; 5, Wharton's duct; 6, Bartholin's duct; 7, masseter muscle; 8, mastoid process; 9, digastric muscle; 10, internal jugular vein; 11, external carotid artery; 12, the tongue.

words *para*, near, and *ous*, the ear, is the largest of the three glands occurring on either side. It lies upon the side of the face immediately in front of

the external ear, and weighs from half an ounce to an ounce. Its duct is about two inches and a half in length, and opens into the mouth by a small orifice opposite the second molar tooth of the upper jaw. The walls of the duct are dense and somewhat thick, and the calibre is about that of a crow-quill.

The *Submaxillary Gland* is situated, as its name implies, below the jawbone (part of which is cut away in the figure), and is placed at nearly equal distances from the parotid and sublingual glands. Its duct is about two inches in length, and opens by a narrow orifice on the top of a papilla, at the side of the *frænum* of the tongue.

The *Sublingual Gland* is situated, as its name implies, under the tongue, each gland lying on either side of the *frænum* of the tongue. It has a number of excretory ducts, which open separately into the mouth.

The minute structure of the parotid gland is described in the article **GLANDS**, and the other salivary glands are similarly constituted. The salivary glands exist in all mammals, except the cetacea, in birds, and reptiles (including amphibians), but not in fishes; and glands discharging a similar function, occur in insects, many molluscs, &c. The chemical and physical characters of the saliva are sufficiently described in the article **DIGESTION**.

The most common disease of the parotid gland is a specific inflammation, which has been already described in the article **MUMPS**. The term *Parotid Tumours* is given to tumours of various kinds occurring in front of the ear and over the parotid gland. With regard to surgical interference, Liston recommends that 'if there be reason to suspect that the disease is of a malignant nature, and not thoroughly limited by a cellular cyst, no interference is admissible; if, on the contrary, it be at all morbid, has advanced slowly, possesses a smooth surface, and is firm, then an operation may be contemplated.'

Certain functional disorders of the salivary glands require notice, of which the most important is that known as *Salivation* (q. v.), or *Ptyalism*, which consists in a much increased secretion of saliva. *Deficient Secretion* is indicated by clamminess & dryness of the mouth, and is common in low fever of fever. It is important as indicating the condition of the system, and seldom requires treatment. It should occur as an original affection, it must be treated by local Sialogogues (q. v.), such as liquor horse-radish, pellitory, &c. *Alteration of the Saliva* is not unfrequent in disease. For example, it sometimes loses its alkaline character, and becomes acid, as in acute rheumatism, diabetes, &c.; whilst, in other cases, it becomes so fetid as to be a source of annoyance both to the patient and his friends, as for example, in scurvy, various forms of dyspepsia, salivation, &c. The undue acidity may be corrected by the administration of carbonate or bicarbonate of soda, while the fetor may be relieved by attention to diet, and by the use, both local and general, of creosote, nitromuriatic acid, charcoal, chlorate of potash, &c.

Ordinary Inflammation of these glands (distinct from mumps) may proceed from cold or local injury, but it is often produced by decayed teeth.

SALIVATION, or **PTYALISM** (from the *ptylon*, the saliva), is the term employed to designate an abnormally abundant flow of saliva. It most commonly arises from a specific form of inflammation of the parotid glands, induced by the action of mercury, in which case it is termed *mercurial salivation*; but it occasionally arises from the action of other drugs, especially iodide of potassium; and sometimes it occurs without any apparent cause.

SALIX—SALLOW-THORN.

in which case it is said to be *idiopathic* or spontaneous.

Mercury, in some form or other, is so common an ingredient in the quack medicines whose advertisements are unfortunately allowed to occupy a large space in many of our newspapers (especially in those medicines which are falsely stated to be of purely vegetable origin), that a popular knowledge of the most remarkable manifestations of this powerful mineral should be as widely diffused as possible. When this medicine is given in such a way as to excite salivation, a metallic taste in the mouth is soon recognised by the patient, and a remarkable but indescribable smell, known as the mercurial fœtor, may be detected in his breath; the gums become swollen and spongy at their edges, and usually present a few slight ulcers; and an increased flow of saliva takes place, accompanied by pain in the teeth on pressure. If these symptoms be not checked (and *a fortiori* if more mercury be given), the tongue, cheeks, and throat swell and ulcerate, and the saliva that flows away amounts to several pints in the course of the day. This peculiar action of mercury varies extremely in different persons. Dr Watson, in his 14th Lecture, records several remarkable cases in which a single small dose of mercury produced the severest salivation. Cases of the opposite kind, in which no impression on the gums or salivary glands can be made by the freest use of mercury, are by no means uncommon. It is worthy of notice that salivation is rarely produced in children below the age of ten years. Until a comparatively recent period, profuse salivation was deemed the only certain indication that the system was duly under the influence of mercury (and, indeed, it was believed that the cause of the disease was carried out of the body with the saliva); but now it is well known that all that is requisite is, that the gums should become distinctly tender, and that the mercurial fœtor should be unmistakably present, and that those symptoms should be kept up for a certain time. Unfortunately, however, the physician cannot always stop the action of the mercury at that definite stage, and salivation to a distressing extent often occurs, even when the greatest care has been taken in the administration of the medicine. To check this excessive salivation, the internal administration of chlorate of potash in scruple doses, three times a day, together with the frequent use of a gargle of the same salt, has been recommended by several high authorities. Dr Watson strongly advocates the use of a gargle composed of one part of brandy to four or five of water, and the application of moistened tannin to the gums; and when there is much external swelling, he applies eight or ten leeches beneath the edges of the jaw-bones, followed by the application of a soft hot poultice to the neck.

It is worthy of notice that, in the confluent form of small-pox, there is almost always more or less abundant salivation, which lasts for several days; and if it cease abruptly, the peril is usually great. Moreover, there is a more or less marked tendency to salivation in scurvy, hysteria, hydrophobia, some forms of mania, and not unfrequently in pregnancy.

Various cases of spontaneous salivation have been collected by Dr Watson in his 44th Lecture. In one instance of a girl ten years old, under his own care, no less than three pints of saliva were excreted in twelve hours. Medicine had no effect; but the salivation finally ceased spontaneously after a severe attack of influenza. In these cases, astringent washes, as a solution of alum, or the infusion of catechu, or a few drops of creosote suspended by mucilage in water, are deserving of trial.

SALIX. See **WILLOW.**

SALLOW, the popular name of a number of species of Willow (q. v.), trees or low shrubs with downy branches, and generally ovate or obovate, wrinkled leaves, having stipules. The **GRAY S.** (*Salix cinerea*) is one of the most common British species, growing in moist and swampy places. Other common species are the **ROUND-EARED S.** (*S. aurita*) and the **GREAT ROUND-LEAVED S.** (*S. caprea*), the latter remarkable for preferring a dry soil, and

Gray Sallow (*Salix cinerea*).

becoming a small tree, the wood of which is used for the handles of agricultural implements. The **LONG-LEAVED S.** (*S. acuminata*) differs from the other kinds in its lanceolate leaves. It is frequent in Britain. None of the salallows produce such long and slender twigs as the osiers, nor are they adapted for any but the coarsest wickerwork, and some of them are so apt to break that they cannot easily be used in that way. But shoots of two years' growth are split up, and used for making hoops of barrels.

Sallow-thorn (*Hippophaë rhamnoides*):
a, Branch of the female plant, in fruit; b, branch of male plant, in flower.

SALLOW-THORN (*Hippophaë*), a genus of plants of the natural order *Elæagnaceæ*, consisting

of large shrubs or trees with gray silky foliage, and entire leaves. They have dioecious flowers: the perianth is tubular, becomes succulent, encloses an achenium, and forms an acid fruit. Few species are known: one only is European, *H. rhamnoides*, sometimes called the SEA BUCK-THORN, a large shrub or low tree, a native of the sandy sea-coasts of England and the continent of Europe. It is found also throughout great part of Tartary. It is sometimes planted to form hedges near the sea, growing luxuriantly where few shrubs will succeed. The berries are orange-coloured. They are gratefully acid. They are used for making a sauce in the south of France: a rob or jam is made of them on the shores of the Gulf of Bothnia, to impart flavour to fresh fish; and a preserve or jelly made from them is a favourite luxury of the Tartars. The *stellate* hairs of the underside of the leaf, covering it like scales, are a beautiful microscopic object.

SALLUST, CAIUS CRISPUS, a Roman historian, was born 86 B.C., at Amiternum, in the Sabine country. Though of a plebeian family, he rose to official distinction, first as quæstor about 59, and afterwards as tribune of the people in 52, when he joined the popular party against Milo, who in that year had killed Clodius. His reputation for morality was never high; and his illicit connection with Milo's wife is assigned as the cause of his being expelled in 50 from the senate, although his attachment to Cæsar's party is a more plausible reason of his expulsion. In the civil war, he joined the camp of Cæsar; and in 47, when Cæsar's fortune was in the ascendant, he was made prætor-elect, and was consequently restored to his former rank. When in Campania, at the head of some of Cæsar's troops, who were about to be thence transhipped to Africa, he nearly lost his life in a mutiny. In 46, however, we find him engaged in Cæsar's African campaign, at the close of which he was left as governor of Numidia. His administration was sullied by various acts of oppression, particularly by his enriching himself at the expense of the people. He was, for these offences, accused before Cæsar, but seems to have escaped being brought to trial. His immense fortune, so accumulated, enabled him to lay out those magnificent grounds, still known as the gardens of Sallust, on the Quirinal, to retire from the prevailing civil commotion into private life, and to devote his remaining years to those historical works on which his reputation rests. He died 34 B.C., four years before the battle of Actium. His histories, which seem to have been begun only after his return from Numidia, are: 1st, *The Catilina*, or *Bellum Catilinarium*, descriptive of Catiline's conspiracy in 63, during the consulship of Cicero; 2d, *The Jugurtha*, or *Bellum Jugurthinum*, commemorating the five years' war between the Romans and Jugurtha, the king of Numidia. These, the only genuine works of S. which have reached us entire, are of great but unequal merit. The quasi-philosophical reflections which are prefixed to them are of no value, but the histories themselves are powerful and animated, and contain effective speeches of his own composition, which he puts into the mouths of his chief characters. With its literary excellence, however, the value of the *Jugurtha* stops, as in military, geographical, and even chronological details, it is very inexact. His now lost work, *Historiarum Libri Quinque*, is believed to have described the events occurring between Sulla's death, 78 B.C., and the year of Cicero's pretorship, 66. *The Dux Epistola de Republica Ordinanda*, and the *Declaratio in Ciceronem*, are of doubtful authenticity.

Apart from his literary qualities, which are rather those of an artificial than a natural writer,

and which are not enhanced by his affectation of brevity, and his love of archaic expressions, S. has the merit of having been the first Roman who wrote what we now understand by 'history.' In official public life, he was more of a politician than a statesman, and the views which he supported were liberal, not so much because he loved the people, as because he hated the nobility. The best editions of his literary remains are those of Corte (Leip. 1724), Gerlach (Basel, 1823—1831), and Krütz (Leip. 1823—1834), which have each a special value.

SALLY-PORT, a gate or passage by which the garrison of a fortress may make a sally (through Fr. from Lat. *salo*, I leap or spring) or sudden attack on the besiegers. The name is applied to the postern leading from under the rampart into the ditch; but its more modern application is to a cutting through the glacier, by which a sally may be made from the covert-way. When not in use, sally-ports are closed by massive gates of timber and iron.

SALMASIUS, CLAUDIUS, the Latinised name of a celebrated French scholar, CLAUDE DE SAUMAISE, who was born at Semur, 15th April 1588. His father, Benigne de Saumaise, a man of superior erudition, was his first teacher. At the age of ten, young S. translated Pindar, and composed Greek and Latin verses. He studied philosophy at Paris under the superintendence of Casaubon. From Paris he proceeded to Heidelberg, where he devoted himself to the science of jurisprudence, and publicly professed Protestantism, to which form of the Christian religion he had been secretly attached for many years. So insatiable at this time was his thirst for knowledge—book-knowledge, at least—that he was wont to devote two whole nights out of three to hard reading, in consequence of which he brought himself to within an inch of the grave. In 1604, he published from MSS. two treatises of the sectary, Nilus, Archbishop of Thessalonica, and a work of the monk Barlaam on the primacy of the pope. In 1629, appeared his chief work, *Pliniana Erratissima in Caii Julii Solimi Polyhistora* (2 vols., Par. 1629); after the publication of which, he set himself vigorously, and without the help of a master, to acquire a knowledge of Hebrew, Arabic, Coptic, and other oriental tongues. In 1631, he was called to Leyden, to occupy the chair left by Joseph Scaliger had held there, and it is from this period that his European reputation as a scholar and critic dates. Various efforts were made (1635—1640) to induce S. to return to France, but he declined them on the ground that his spirit was too 'liberal' for his native land. Queen Christina of Sweden, however, managed to bring him to Stockholm, and fix him there for a year (1639—1651), after which he returned to Holland. He died of a fever caught by imprudently drinking the waters at Spa, 6th September 1658. S. was certainly a great scholar of the old-fashioned clumsy sort; but neither his wit nor his acumen was sufficiently keen to give an intellectual and critical value to his lucubrations; and though all his distinguished contemporaries, Casaubon, Gronovius, Grotius, Vossius &c., deluged him with praise; though Balzac pronounced him *infallible*; though the curators of the university of Leyden declared that 'their university could no more do without Salmasius than the world without the sun'; though Queen Christina went the length of saying, with truly royal flattery, 'that she could not live without him'—he is remembered not for his inexhaustible stores of erudition, his editions of the classics, or his treatises on classical antiquities, but for his controversy with J. B.

SALMON.

Milton, scarcely his inferior in scholarship, and infinitely his superior in power of brain, and in all the arts of literary warfare. The question at issue was the lawfulness of the execution of Charles I. Apart altogether from the merits of the case, the great poet utterly overwhelmed his adversary, partly by the magnificence of his language and sentiments, and partly by the unscrupulous fury of his invective. S. also is grossly abusive and acrimonious in his treatise (*Defensio Regia pro Carolo I.*, 1649): *asinus* (ass), *pecus* (beast), and such-like expressions being showered about quite freely; but he is deficient in logic, in real force of sarcasm, and in intellectual vigour generally.

SALMON (*Salmo*), a genus of fishes of the family *Salmonidae* (q. v.), which, as characterised by Cuvier, has teeth on the vomer, both palatine bones, and all the maxillary bones; and includes numerous species more recently divided by Valenciennes into three genera, *Salmo*, *Fario*, and *Salar*: the first characterised by a few teeth at the end of the vomer; the second, by a single line of teeth running down the vomer; the third, by two rows of teeth on the vomer, without any remarkable group at its upper end. To many naturalists, however, this division seems too artificial; and the characters, although excellent for distinguishing species, not such as ought to divide genera; an opinion confirmed by the fact, that the teeth are numerous along the vomer in the young of the species, as the Common S., which finally retain only a group of them at the end. The division made by Valenciennes separates the S., the Salmon Trout, and the Gray or Bull Trout, the only British species which ascend rivers from the sea, into the two genera *Salmo* and *Fario*; whilst the Common Trout is referred to *Salar*. A much more natural division, having regard to characters really conspicuous and important, and to the habits of the species, is the simple one of Mr Pennell (*The Angler Naturalist*, 1863), which is really nothing more than a formal recognition of groups practically recognised by every one acquainted with the fishes which compose them: 1. The Silver, or Migratory species (i. e., those migrating to and from the sea); 2. The Yellow, or Non-migratory species; 3. The Charrs, or Orange and Red-coloured species. The present article is devoted to the first of these groups. The second is noticed in the article TROUT; the third, in the article CHARR.

By far the most important of the three *Salmonidae* which ascend the rivers of Britain from the sea is the **SALMON** (*Salmo salar*), in commercial importance far superior to any other fresh-water fish, both on account of the abundance in which it is procured in the northern parts of the world, and of its rich and delicious flavour. From ancient times it has furnished important supplies of food; and the S. fisheries of Britain have long been a subject of anxious attention to the legislature. Even rivers of Iceland now yield a rent, and are regularly netted for the supply of the British market, to which the S. are brought, as from other northern regions, fresh, in ice. Many rivers and streams, also, are rendered valuable by the S. which periodically visit them, as affording sport to anglers with which nothing of the same kind is deemed worthy of comparison, and those of Norway, as well as those of Britain itself, are now frequented by British anglers.

The S. is one of the largest species of the genus, having been known to attain the weight of 83 lbs., whilst S. of 40 or 50 lbs., and even upwards, are occasionally brought to market. Very large S., however, are not common, owing to the eagerness with which the fishery is prosecuted. No fish is,

more symmetrical or beautiful than the S.; and its form is admirably adapted to rapid motion even against powerful currents, by the regular tapering from the front of the first dorsal fin both to the snout and to the tail, but more suddenly in the

Salmon (*Salmo salar*).

former direction, by the nearly equal convexity of back and belly, and by the perfect smoothness and want of angularity. The head is about one-fifth of the whole length of the fish. The under-jaw of the male becomes hooked during the breeding season with a kind of cartilaginous excrescence, which is used as a weapon in the combats then frequent, wounds so severe being inflicted with it that death sometimes ensues. The lateral line is nearly straight. The scales are small, and the colour a rich bluish or greenish-gray above, changing

Salmon Trout (*Salmo trutta*).

to silvery-white beneath, sprinkled above the lateral line with rather large black spots. The opercular bones shew a rounded outline at the hinder edge of the gill-covers, which at once distinguishes this species from the only other British species that can be confounded with it, the Salmon Trout and the Gray or Bull Trout. The tail is forked in the young

Gray, or Bull Trout (*Salmo erioz*).

S., but becomes nearly square in the adult. The mouth of the S. is well furnished with teeth; a line of teeth on each side of the upper jaw; an inner line on the palatine bone, two or three in the adult state at the end of the vomer, two rows on the tongue, and one row along the outer edge of each lower jaw-bone. This array of teeth indicates voracity, and the S. seems to prey readily on almost any animal which it is capable of capturing, though it is a somewhat singular fact, that the stomach when opened is rarely found to contain the remains of food of any kind: two or three herrings of full size have, however, been found in its stomach; the sand-lance and other small fishes seems to constitute part of its food; and when in fresh water, the minnow, trout-fry, or the fry of its own species, worms, flies, &c. The angler catches S. with the artificial fly, or with the minnow or the worm; and no bait is more deadly than the roe of the S. itself, the use of which is indeed prohibited in

British acts of parliament intended for the protection of the S. fisheries. The eggs of crustaceans have also been found in the stomach of the S. in such quantities as to shew that they form a very considerable part of its food.

The S. is found on the coasts of all the northern parts of the Atlantic, and in the rivers which fall into that ocean, as far south, at least, as the Loire on the European side, and the Hudson on the American. Slight differences can be noted between the American and the European S., but they are not generally thought sufficient to distinguish them as species. The S. frequenting one river are, indeed, often characteristically different from those of another river of the same vicinity. The S. is not found in the Mediterranean nor in the Black Sea, nor in any of the rivers falling into them; and in the Arctic Ocean and its rivers, as well as in the northern parts of the Pacific Ocean, other species of the same genus take its place. The preservation of S. in a fresh state by means of ice, being an invention of recent times, this fish never appeared at the luxurious tables of ancient Rome except dried or salted, although its excellence was well known, the Romans having become acquainted with it in their northern conquests. S. is in perfection for the table only when recently taken from the water; whilst the fatty 'curd' remains between the flakes of its flesh, which, however, begins to disappear within 12 hours, although otherwise the fish is quite fresh. Hence the peculiarly high value formerly ascribed in London to *Thames salmon*.

The S., after its first migration to the sea, passes a great part of its life in it, although under the necessity of periodically ascending rivers, in which the S. that ascend to spawn or for other causes in autumn, often remain during most of the winter. S. return, in preference, to the same rivers in which they have passed the earliest part of their existence; as appears both from records of marked S., and from the characteristic differences already alluded to. S. ascend rivers to a great distance from the sea, as the Rhine to the Falls of Schaffhausen, and the Elbe to Bohemia. The speed with which they glide through the water in their most rapid movements is very great; it is said to be not less than 1500 feet in a minute, or at the rate of 400 miles a day; but this, of course, is sustained only for a few moments, and the ordinary rate of progress in ascending rivers is supposed to be from 10 to 25

Salmon-ladder.

miles a day. The fish, also, almost always chooses to lie for a time in some spot, waiting a fresh flood in the stream. The perpendicular height which the

S. can pass over by leaping, when there is abundance of water in the river and sufficient depth in the pool below the fall, seems to be not more than 12 or 14 feet; they attempt higher leaps, but often fall back exhausted, or fall on adjacent rocks, where they die or are captured. They do, however, rush up steep and broken cataracts of much greater height. The ascent of many rivers by S. has been stopped by high weirs and other obstructions; but very simple and effectual means have been devised for preventing this by *fish-stairs* or *fish-ladders*, which are often very conveniently formed by partitioning off a portion of the fall, and intersecting it from alternate sides, two-thirds of its width, by transverse steps of wood or stone, so as partially to divide it into a succession of falls. The S. soon find out the ladder, and leap up from one step to another. By this, the interests of manufacturers and of fishery proprietors are in some measure reconciled.

As the time of spawning approaches, S. undergo considerable changes of colour, besides the change of form already noticed in the snout of the male. The former brilliancy of the hues gives place to a general duskiness, approaching to blackness in the females, much tinged with red in the males; and the cheeks of the males become marked with orange stripes. S. in this state are 'foul fish,' being considered unfit for the table, and the killing of them is prohibited by British laws, notwithstanding which, however, multitudes are killed by poachers in some of the rivers, nor do those who eat them either fresh or 'kippered' (i. e., dried) seem to suffer from any unwholesomeness, such as is sometimes alleged to belong to them, although they are greatly inferior in quality to S. in other states. S. which have completed their spawning, continue for some time, at least if in fresh water, very unfit for the table. Their capture is prohibited by British laws. They are called '*foul fish*,' or more distinctively, '*spent fish*,' or *Kelts*; the males are also called *Kippers*, *kipp* being a name for the cartilaginous hook of the under jaw, and the females *Sheldons* or *Baggies*. Such names, originally local, have become of more general use from having been introduced into acts of parliament. The name *Kelt*, in particular, is now very commonly employed. When they remain for a considerable time in fresh water after spawning, kelts recover very much, and increase in weight, whereas, before spawning, there is a diminution of weight. 'A well-mended kelt' approaches in quality to a good or 'clean' S., although far from being equal to it.

The time of spawning is from the end of autumn to the beginning of spring, or even the beginning of summer; differing considerably in different rivers, whilst in each river it is prolonged throughout months, the elder and stronger fish of the former year probably ascending to spawn first. The difference of season in different rivers is probably to be accounted for by the temperature of the water, as affected by latitude, and by the relations of the river to lakes, to low warm plains, and to snow-covered mountains.

S. spawn on beds of fine gravel, in shallow parts of rivers, such as are used for the same purpose by trout. Some beds of this kind, in salmon-frequented rivers, have been notable from time immemorial as favourite spawning-places; and large numbers of fish, both the S. and its congeners, deposit their spawn in them every year. The spawning female approaches the bed, attended by at least one male fish, sometimes by more than one, in which case fierce combats ensue; she makes a furrow in the gravel with her tail, and deposits her spawn in it, on which the male afterwards pours the vivifying melt. It was formerly believed that the furrow

SALMON.

was in part made by the snout of the fish, and to this the snout of the male at the spawning season was supposed to be particularly adapted; but it has been found by observation that the snout is not

Old Male Fish, or Kipper, during the Spawning-season.

used in this work. The eggs, when deposited and vivified, are covered by the action of the tail of the female; the male doing nothing but depositing his milt, and fighting with any other of his sex that may attempt to dispute his place.

The time occupied by a female S. in spawning is from three to twelve days. After spawning, the S. generally soon descends to the sea. The descending *kelts* are very ravenous, and therefore a great annoyance to anglers who desire to take none but *lean* fish, and must return the *kelts* to the water.

The eggs deposited in the spawning bed are liable to be devoured by trouts and other fishes, which are ever ready, and by insect larvae of many kinds, which work their way even through the gravel; ducks and other waterfowl also search here for their food; and sometimes a flood changes the bed so much as either to sweep away the eggs, or to overlay them with gravel to a depth where they are never hatched, or from which the young can never emerge. The number of eggs hatched in ordinary circumstances must be small in proportion to the number deposited, and by far the greater part of the fry perish before the time of descent to the sea.

In from thirty to sixty days after the deposition

Salmon Ova, and Newly Hatched Fish.

(Copied from the *Field* newspaper.)

1, egg of salmon, natural size, just taken from the parent fish; 2, the same, with the eyes of the young fish just becoming apparent; this takes place about the thirtieth or thirty-fifth day, according to the temperature; 3, the young fish coiled up in the egg, and just ready to be hatched; 4, the young fish emerging from the shell; 5, the empty egg-shell, showing longitudinal rent made by the young fish; 6, young salmon about two days old, natural size; 7, the young salmon (about two days old), magnified; the umbilical vesicle, containing the yolk and the oil globules, and blood-vessels ramified on its surface; also the head, with the huge eyes and badly-developed mouth (a portrait); the fins and the thin transparent body, the fins not as yet being developed into their proper shape, are carefully delineated.

In the eggs in the spawning bed, they begin to show signs of life, and the eyes appear as small pecks. The time which elapses before the egg is

hatched varies according to the temperature of the water, and therefore is generally shorter in England than in Scotland, 140 days being sometimes requisite in cold climates and late springs; whilst it has been found that in a constant temperature of 44° F. sixty days are enough, and in a higher temperature eggs have been hatched even in thirty days. A temperature above 70° F. is, however, fatal to them. S. eggs are easily hatched in an aquarium, in which proper care is taken to prevent stagnation of the water, so that the conditions may resemble those of a bed of gravel in a running stream, and many interesting observations have thus been made by Mr Frank Buckland on the development of the young S., of which the results have from time to time been given to the world through the columns of the *Field* newspaper, and his excellent work on *Fish-Hatching*.*

The young fish lies coiled up in the egg, which it finally bursts in its struggles to be free, and it issues with a conical bag (umbilical vesicle) suspended under the belly, containing the red yolk of the egg and oil globules, which afford it nourishment during the first five or six weeks. The mouth is at first very imperfectly developed, as are the fins, and the whole body has a shape very different from what it is soon to assume, and is very delicate, and almost transparent. The slightest injury is fatal. The length, at first, is about five-eighths of an inch. About the seventh or eighth week, the

Gill-covers of Salmon (1), and Salmon Trout (2).

young S. has changed into a well-formed little fish about an inch long, with forked tail, the colour light brown, with nine or ten transverse dusky bars, which are also more or less distinctly visible in the young of other species of this genus, just as the young of many feline animals exhibit stripes or spots which disappear in their mature state. The fry, previously very inactive, now begin to swim about, and seek food with great activity, and are known as PARR, or SAMLET, and also in some places by the names *Pink*, *Brandling*, and *Fingerling*. The Parr was formerly supposed to be a distinct species (*S. salmulus*), an opinion to which many anglers, eager to enjoy their summer holidays, and catching parr by scores with the artificial fly or worm when they can catch nothing else, have clung tenaciously, after it has been shewn to the satisfaction of all naturalists that the parr is nothing else than the young salmon. The honour of proving this belongs to Mr Shaw, of Drumlannrig, Dumfriesshire, whose observations and experiments, first made in 1834—1836, we have not space to detail. They have, however, been fully confirmed at the salmon-breeding ponds of Stormontfield, on the Tay.

Gill-covers of Bull Trout.

* London: Tinsley Brothers, 1863.

It was long urged, to prove the parr a distinct species, that the male parr is very often found with the milt perfect, to which, however, it was replied that the female parr is almost never found with perfect roe. But the remarkable fact has now been abundantly proved that the male parr is capable of impregnating the roe of the female S., and thus a provision seems to be made in nature to prevent an otherwise possible loss of roe. And, indeed, ridiculous little parrs seem to be always ready at hand to perform this service during the combats of the great fish, or in their absence. Another remarkable fact has been discovered, that some parrs descend to the sea in their first year, whilst others remain in the fresh water, and in the parr state, without much increase of size for another year, and a few even to the third year. At Stormontfield it has been found that about one half of the parrs migrate when a year old. No reason can be assigned for these things; the facts alone are known to us, and have but recently been established.

The parr attains a size of from $3\frac{1}{2}$ to 8 inches. When the time of its migration comes, usually in May or June, it assumes brilliant silvery hues, the fins also becoming darker, and is then known as a *Smolt*. Groups of smolts, 40 to 70 in a group, now descend, not very rapidly, to the sea. They remain for a short time in brackish water, and then depart from the estuary. Of their life in the sea nothing is known, except that they increase in size with wonderful rapidity; for it has been found that smolts which had been marked, returned to the same river in six or eight weeks as *Grilse* of three to five pounds, or, after a longer period, even of eight or nine pounds. Some reascend the rivers when only a pound and a half or two pounds weight, and these are in some places known as *Salmon Peal*. Grilse are captured in great numbers in the latter part of summer and in autumn, but very few are seen in the earlier part of the fishing season. The grilse usually spawns on its first return to the fresh water—often remaining there for the winter, and on again descending to the sea assumes the perfect characters of the mature salmon. Little increase of size ever takes place in fresh water; but the growth of the S. in the sea is marvellously rapid, not only on its first migration, but afterwards. A kelt caught by the late Duke of Athole on 31st March weighed exactly ten pounds. It was marked, and returned to the Tay, in the lower part of which it was again caught, after five weeks and two days, when it was found to weigh twenty pounds and a quarter.

The statistics of S. fisheries are, like those of other fisheries, very imperfect. It is impossible to ascertain the total annual value of the S. fisheries even of Great Britain and Ireland; but it must be reckoned by hundreds of thousands of pounds. From the Reports of the Irish Commissioners, we learn that, in 1862, apparently an ordinary year, three Irish railways conveyed 400 tons, or about 900,000 lbs. of salmon, being equal in weight and treble in value to 15,000 sheep, or 20,000 mixed sheep and lambs. In Scotland, the Tay alone furnishes about 800,000 lbs., being equal in weight and treble in value to 18,000 sheep [and lambs]. The weight of salmon produced by the Spey is equal to the weight of mutton annually yielded to the butcher by each of several of the smaller counties. The diminution in the supply of food caused by the decay of the Tweed fisheries is about 200,000 lbs. a year. And in making comparisons between the supplies of fish and of flesh, it must be kept in mind that fish, or at least salmon, though higher in money value, cost nothing for their keep, make bare no pasture, hollow out no turnips, consume no

corn, but are, as Franklin expressed it, "bits of silver pulled out of the water."—(Russel, *The Salmon*, p. 12.) The other British species yet to be noticed in this article, are reckoned with the S. itself in a that relates to S. fisheries.

The S. fisheries of the British rivers have in general much decreased in productiveness since the beginning of the present century, which is very much ascribed to the introduction of fixed or standing nets along the coast, by which S. are taken in great numbers before they reach the mouths of the rivers to which they are proceeding, and in which alone they were formerly caught; it having been discovered that S. feel their way, as it were, close along the shore for many miles towards the mouth of a river, feeding, meanwhile, on sand-lances, sand-hoppers, and other such prey. It is also partly owing to the destruction of spawning fish by poachers; and in no small measure to the pollution of rivers consequent on the increase of population and industry, and to the more thorough drainage of land, the result of which has been that rivers are for a comparatively small number of days in the year in that half-flooded condition in which S. are most ready to ascend them. The last of these causes is the most irremediable; but if the action of the others were abated, it would not of itself be sufficient to prevent a productiveness of our rivers much greater than the present. The efforts which have begun to be made by breeding ponds (see *PISCICULTURE*) to preserve eggs and fry from destruction, and so to multiply far beyond the natural amount the young S. ready to descend to the sea, promise also such results as may yet probably make the supply of S. far more abundant than it has ever been. There is reason to think that the productiveness of the waters may be increased as much as that of the land.

The stake net is the most deadly of all means employed for taking S.; and its use is prohibited in estuaries and on some other parts of the coast. It consists of two rows of net-covered stakes placed between high and low water marks, thus coming up to them, and proceeding along them, or conducted through a narrow opening into what is called the court of the net, from which they cannot find the way of escape. The *cruise*, which is now illegal in all parts of Britain, is an enclosed space formed in the wall of a dam or weir, into which the S. enter as they ascend the stream, whilst a peculiar kind of grating prevents their return. The net employed for catching S. in rivers and estuaries is of many different kinds. In many places a small boat, or *salmon coble*, is used to carry out a seine from the shore, setting (*shooting*) it with a circular sweep, the concavity of which is towards the stream or tide, and men stationed on shore pull ropes so as to bring it in by both ends at once with whatever may have enclosed. Coracles (small boats of basket-work or a light wooden frame covered with canvas and tar, or other waterproof material) are used for S. fishing in the Severn and other Welsh rivers. Nets which a single man can carry and work are also used in many rivers and estuaries, as those called *halves* on the Solway, which may be described as a bag attached to a pole. Dogs have sometimes been trained to drive S. into nets, and some do have attained great expertness in catching S. without any assistance.

The SALMON TROUT (*S. trutta*, or *Fario arescens*) also very commonly called the SEA TROUT, is rather thicker in proportion to its length than a S. of the same size, and has the hinder free margin of the opercle less rounded. The jaws are nearly equal in teeth strong, sharp, and curved, a single row runs down the vomer, and pointing alternately in opposite

directions. The colours are very similar to those of the S.; the sides, chiefly above the lateral line, are marked with numerous X-shaped dusky spots, and there are several round dusky spots on the gill-covers. The salmon trout does not attain so large a size as the S., but has been known to reach 24½ lbs. The flesh is pink, richly flavoured, and much esteemed, although not equal to that of the salmon. Great quantities of salmon trout are brought to market in London and other British towns; this fish being found from the south of England to the north of Scotland, and plentiful in many rivers, particularly those of Scotland. Its habits are generally similar to those of the salmon. Large shoals sometimes congregate near the mouth of a river which they are about to enter, and sometimes afford excellent sport to the angler in a bay or estuary, rising readily to the fly. The young are not easily to be distinguished from parr. *Phinock*, *Hirling*, and *Whiling* are local names of the salmon trout on its first return from the sea to fresh water, when it has its most silvery appearance, in which state it has sometimes been described as a distinct species (*S. albus*).

The GRAY TROUT or BULL TROUT (*S. eriox*), the only other British species migrating like these, is already noticed in the article BULL TROUT. The gill-cover in this species is more elongated backward at the lower angle than in the other two. In the banks of the Tweed and some other rivers, it is often called the sea trout, a name quite as appropriate to it as to the salmon trout. The seasons in which the gray trout ascends rivers are partly the same with those of the S. and salmon trout, and partly different. The laws relative to the fishing in S. apply equally to the bull trout.

Of other species of *S.* our notice must be very brief. Cuvier has described as a distinct species a trout with hooked lower jaw, known in France by the name of *Beard*. Agassiz and Bloch regard it as merely the old male of the Common Salmon. The hooked lower jaw of the male of the Common S. in the spawning season has been already noticed. But Valenciennes adheres to the opinion of Cuvier that the *Beard* is a distinct species, and insists on the greater length of the intermaxillary bones as a sure distinctive character; asserting also that the colours are always different from those of the common S.; the general reddish-gray, the belly dull white, the neck never blue, nor the belly silvery. The subject seems to require further investigation.—The HUCHO of the Danube, called *Reo* in Galicia (*S. Hucho*), attains a weight of 30 lbs., and it is said even of 60 lbs. The body is longer and rounder, the head more elongated than in the Common Salmon. The colour is grayish-black, tinged with violet on the neck, the sides and belly silvery. The tail is forked. The hucho spawns in June, making holes for the purpose in gravelly bottoms; and these holes are so deep that the fish lying in them often escape the nets of the fishermen. The flesh is white, but very pleasant. The same, or a very similar species, is found in the Caspian Sea, and in rivers which flow into it.—The rivers of North America which flow into the Arctic Ocean, produce several species of *S.*, of which perhaps that most nearly resembling the Common S., in the quality of its flesh, is *S. Hearnii*. In these regions, Ross's *S.* (*S. Rossii* or *Furio Rossii*) is extremely abundant. It is of a more slender form than the S., with remarkably strong lower jaw and truncated snout; the scales separated by naked skin; the back greenish-brown, the sides pearl-gray, the belly orange or red. In the quality of its flesh it is very inferior to the salmon. *S. Scouleri*, or *Salar Scouleri*, ascends the Columbia and other rivers of the north-west coast of North

America in vast multitudes. In arms of the sea on that coast it is sometimes impossible for a stone to reach the bottom without touching several; and the channel of a river or a brook is often densely crowded with them. The flesh is excellent. The same species seems to ascend the rivers of Kamtschatka; but that country, the Kurile Isles, and Siberia have also species of their own. Concerning many of the species which have been named and partially described, there is still, however, great uncertainty.

ANGLING FOR SALMON.—The capture of the salmon by rod and line affords the most exciting sport of the kind. The pleasures of it have been descanted on by numerous writers, and whole treatises have been written on the minutiae of the art. Among the more modern writers on the subject, we may name Davy, Stoddart, Colquhoun, Younger, Stewart, Francis, and Russel. The tackle used is sufficiently described in the article ANGLING; and the general principles of fly-fishing there laid down are applicable in this case. The chief specialty in salmon angling is to be able to maintain perfect coolness and vigilance when the fish is hooked. The rod must be kept at such an elevation as to bring its elasticity into play; and by allowing the line to run out as the fish dashes off, and winding it up as he returns, or by following his motions, if need be, in person, a constant and equal strain must be maintained; a sudden tug at an unyielding line, or a momentary slackening, being equally fatal. After struggling for from a quarter to half an hour (sometimes, though rarely, for two or three hours) against a steady pull, the fish generally yields to his fate and allows himself to be drawn into the shallow and landed. This is done either with the gaff; or the fisher, winding his line up within rod length and holding the top landwards, without slackening, seizes the fish with one hand by the root of the tail, and lifts, or rather slides him head-foremost on to the gravel or grass.

Those rivers of Britain where the fishing is strictly preserved, still afford good sport; but of late years the take of fish, by rod as well as by net, has greatly fallen off, and many fishers now betake themselves annually to the rivers of Norway and Sweden. In Scotland the Tay, Tweed, Don, Spey, Dea, Thurso, and some others are still preserved in many places, and command high rents from salmon anglers.

SALMON-FISHERY LAWS.—Owing to the peculiar excellence of the salmon, it is singled out from all other fish, and protected by peculiar laws in the United Kingdom, but those laws are not the same in the three kingdoms. I. As to England.—The right to fish salmon in the sea and navigable rivers belongs to the public as a general rule; and the right to fish salmon in rivers not navigable belongs to the riparian owner on each bank, the right of each extending up to the centre line of the stream. But though the public have, as a rule, the right to fish in the sea and navigable rivers, there are various exceptions, which arose in this way. Previous to Magna Charta, the crown, whether rightly or wrongly, assumed power to make grants to individuals—generally the large proprietors of lands adjacent—whereby an exclusive right was given to such individuals to fish for the salmon as well as all other fish within certain limits. This right, when conferred, often applied to the shores of the sea, but generally prevailed in navigable rivers and the mouths of such rivers. The frequency of such grants was one of the grievances redressed by Magna Charta, which prohibited the crown thenceforth from making like grants. But the then existing grants were saved, and hence every person who at the present day claims a several or exclusive

fishery in navigable rivers, must shew that his grant is from the crown, and is as old as Magna Charta. It is not, however, in any way necessary that he be able to produce a grant or chain of grants of such antiquity; for if he has been in undisturbed possession for a long time—say sixty years and upwards—it is presumed that such title is as old as Magna Charta, and had a legal origin. When a person is entitled to a salmon fishery (and if he is entitled to a salmon fishery he is entitled also to the trout and other fish frequenting the same place), he is nevertheless subjected to certain restrictions as to the mode of fishing salmon. These restrictions are imposed by the Salmon Fishery Acts of 1861, 1865, and 1873, which repealed prior acts of parliament. No person is now entitled to use lights, spears, gaffs, strokehalls, snatches, or other like instruments for catching salmon; nor can fish roe be used for the purpose of fishing. All nets used for fishing salmon must have a mesh not less than two inches in extension from knot to knot, or eight inches measured round each mesh when wet. No new fixed engine of any description is to be used. A penalty is incurred for violating these enactments, and also for taking unseasonable salmon, or for taking, destroying, or obstructing the passage of young salmon, or disturbing spawning salmon. The close time, during which no salmon shall be fished, extends from 1st September to the 1st February following, except that for rod fishing the close season shall not commence till 1st November. These periods may by byelaws be slightly varied for each district. During close time no salmon can be legally sold or be in the possession of any person for sale; and such fixed engines as are still legal shall be removed or put out of gear during close time. Moreover, throughout the year, there is a weekly close time—that is to say, no person can, except with rod and line, lawfully fish salmon between 12 A.M. (noon) of Saturday to 6 A.M. of Monday following. Though owners of dams need not make fish-passes, there must be free gaps made in fishing weirs of a certain width. For the purpose of supervising the enforcement of the acts, fishery inspectors are appointed for England. Fishery Boards were established in 1866, and by bye-laws can change close seasons, license duties for fishing instruments, mesh of nets, and other matters, within limits. See also POACHING.

II. In Scotland, there are various important differences from the law of England as regards salmon fisheries. In Scotland, the general rule is that all salmon fisheries in the rivers and surrounding seas are vested in the crown, and hence no person is entitled to fish with nets or engines except he can shew a grant or charter from the crown. If he can only shew a general grant of fishings without specifying salmon, then it is necessary not only to produce such grant, but to shew that he has been in exclusive possession for forty years and upwards of the salmon fishings. Moreover, while this right to catch salmon by nets is vested in the crown, or in some grantee of the crown, the right to angle for salmon is now held to be included, and does not belong to the riparian owner. The public, *qua* public, have no right anywhere in Scotland to fish for salmon either with net or rod. By virtue of many old statutes, all fixed engines for catchingsalmon are illegal, and it is settled that everything is in the nature of a fixed engine which is not held in the hand of the fishermen while they are fishing; but a mechanical contrivance, which enables the fisherman to go a little further into the river with his coble or boat, which is to drag the net, is not illegal. Stake nets, however, are not illegal if they are not in a river or the

mouth of a river. In 1862 and 1863, statutes were passed for regulating the Scotch salmon fisheries. By these acts fishery districts are authorised to be managed by boards. These boards consist of the large proprietors of fisheries. The boards appoint constables, water-bailiffs, and watchers, forming a kind of river police. The board has power to assess the various proprietors in sums so as to raise funds for paying the expenses of working the act—funds being raised in England only by local duties. The annual close time for salmon fishing is fixed by the commissioners, and varies in each district, but it generally extends from 27th August to 10th February following; the angler's close time commencing about 16th October. The commissioners are appointed by the Home Secretary, their duties being to fix the limits of fishery districts, of rivers, to make general regulations as to close time, cruives, nets, &c. The Scotch acts modify the English acts in prohibiting fishing with nets or salmon roe, with nets having small meshes, &c. And there is a weekly close time from 6 A.M. on Saturday to 6 A.M. on Monday following.

III. Ireland.—The Irish salmon fishery laws are regulated chiefly by statutes distinct from those of England. Fishery districts are there established, and the fisheries are subject to rates and license duties for the purpose of raising funds. There is an annual and weekly close time, and fixed engines are prohibited, and free gaps enforced in all fishing weirs.

SALMONIDÆ, a very large and important family of malacopteroous fishes, of the suborder *Abdominales* (having the ventral fins on the abdomen, and behind the pectorals), nearly allied to *Clupeidæ* (the Herring family), but at once distinguished by the second dorsal fin, which they do not have, and which is merely a fold of the skin, containing fat, whence it is called the *adipose fin*, and destitute of rays. They were all included by Linnaeus in the genus *Salmo*, although now divided not only into numerous genera, but by many naturalists into several families, of which one retains the name of *S.*, and the other principal ones *Characinidæ* and *Scopelidæ*. The *S.* are generally very muscular, and possess great strength, swimming with great rapidity, even against strong currents, and some of them are capable of leaping up falls of considerable height, when there is sufficient depth of water beneath. Some of the sea-fishes, never entering rivers, although the herring, pilchard, &c., they approach the river to spawn; others are generally inhabitants of the river but ascend rivers to spawn, and some of them on other occasions not yet well understood. Again, are constant inhabitants of fresh-water rivers or of rivers and streams. Most of them are esteemed for the table, and some are among the most esteemed of fishes.

The restricted *S.* of those naturalists who divide the family, are all scaly fishes, but with the head destitute of scales, and the cheeks fleshy; the part of the mouth is formed by the premaxillary and maxillary bones together; the branchial rays are numerous; the air-bladder is large and simple; the teeth are usually small, sometimes numerous, the tongue being furnished with teeth as well as the other parts of the mouth. In some others have the teeth few and small, or even wanting. They are generally voracious fishes, feeding chiefly on other fishes, crustaceans, worms, &c. Salmon, Salmon Trout, Bull Trout or Gray Trout, Charr, Grayling, and Smelt, are the most British examples. The White Fish of North America is one of the most important species. The same genus (*Coregonus*) belong many inhabiting the lakes and rivers of the northern

the world, some of them, from their herring-like appearance, known as *Herring-salmon* and *Fresh-water Herring*. The Capelin (q. v.) is a sea-fish, never entering fresh waters. The restricted or true are found only in the northern parts of the world, and chiefly in the colder regions.

The *Characnidae* also have the body scaly, and a head destitute of scales; the upper part of the mouth is formed by the premaxillaries and maxillaries together; there are only four or five anchiostegal rays; the air-bladder is divided by constriction in the middle; the teeth are very various, wholly wanting in a few, numerous in most of the genera, present on the tongue in some, and not in others; small and feeble in some, in others large and strong; in many conical and sharp, some flat. Most of the species feed on animal food, but a few on vegetable food alone; whilst some are omnivorous, eating with equal readiness worms or other soft animals and fruits which fall to the water. One of those feeding exclusively on vegetable substances is the Pacu (*Myles Pacu*), which scarcely excelled by any as an article of food, which has teeth very like the molar teeth of sheep, and employs them in browsing on the plants that grow on rocks covered with water, near the catacums of the rivers of Guiana, and in some of the tributaries of the Amazon. In form, it is very like the trout or salmon, being short, thick, and unsymmetrical. This, however, is not unfrequent in the *Characnidae*, which exhibit much greater variety of form than the *S.* proper. Thus, in some of the genus *Serrasalmo* (see PIRAYA), of which there are many species, voracious carnivorous fishes with sharp trenchant teeth, the depth of the body is almost as great as its length. The species *Serrasalmo* are sometimes called *Saw-bellied salmon*, from their keeled and serrated belly. The *Characnidae* are all inhabitants of fresh waters; some of them African, but the greater number north American. Their flesh is generally much esteemed.

The *Scopelidae* differ from both the previous sections of *S.* in the structure of the mouth, which is armed entirely of the premaxillary bone, the maxillary lying behind. Few of them have an air-bladder. Some are scaly, and some destitute of scales. The form of the body is salmon-like in some, but deep and compressed in others. They are generally marine, as the Argentine (q. v.), the only British species. They abound chiefly in the warmer seas; the Mediterranean produces some; but the greater number belong to the Chinese and the Indian seas. Some are in high repute for their fine flavour.

Australia produces none of the *Salmonidae*. The rivers and streams of that region, however, as well as those of New Zealand, Patagonia, and the Falkland Islands, produce a number of species of *Galaxias*, genus of very trout-like form, but with no scales and no adipose fin. They are called *trouts* by the colonists in Australia and New Zealand, but are of very inferior quality for the table.

SALOMON, JOHANN PETER, an eminent musician, violin-player, and composer, born at Bonn in 1745. When young, he was attached to the service of Prince Henry of Prussia, for whom he composed several operas. In 1781, he visited Paris, and afterwards London, where he met with so warm a reception, that he was induced to settle there. His series of subscription concerts in London, in 1790, was an era in the history of music, in so far as they led to the production of Haydn's twelve modest symphonies, known as the Salomon set. In 1800, *S.* retired from public life, but continued to compose songs, glees, and violin solos and

concertos. He died in 1815, and was interred in Westminster Abbey.

SALONIKI (anc. *Thessalonica*, Turk. *Selanik*), a town of European Turkey, in the eyalet of the same name, and, next to Constantinople, the greatest emporium of commerce in the empire, is situated on the Gulf of Saloniki, and rises from the shore along the face of a hill. The city is enclosed by white walls, partly ancient and partly medieval, about five miles in circuit, and is surrounded by cypresses and other evergreens. As seen from the sea, it presents a bright and beautiful appearance; but its internal aspect is miserable in the extreme. The principal buildings are mosques, most of which were previously Christian churches. The *Citadel*, called by the Turks *Vedi-Kuleh*, or 'the Seven Towers,' is the ancient Acropolis; within it are to be seen the ruins of a triumphal arch belonging to the time of Marcus Aurelius. Other relics of antiquity are the Propylæum of the Hippodrome, a magnificent Corinthian colonnade of five pillars; the triumphal arch of Augustus, erected after the battle of Philippi (now forming the gate of Vardar or Vardari); the arch of Constantine, &c. *S.* exports the corn, cotton, wool, tobacco, bees-wax, and silk of Macedonia. *S.* is connected by railway with Uskub, nearly 100 miles inland. This line, when completed to Sophia, will bring *S.* into connection with Constantinople. Pop. 70,000, of whom 30,000 are Turks, 20,000 Greeks, and 20,000 Jews.

S. was at first called Therma, under which designation it is mentioned in connection with the march of Xerxes through Greece. It was rebuilt by Cassander about 315 B.C., who probably named it Thessalonica in honour of his wife; and during the Roman-Macedonian Wars, it figures as the principal station of the Macedonian fleet. After the close of the civil wars, its prosperity rapidly increased, and for three centuries it was the first city in Greece. It was early the seat of a Christian church. During the barbarian invasions, it proved the great bulwark of the Eastern empire. It was thrice taken in the middle ages—first, by the Saracens in 904; secondly, by the Sicilian Normans in 1185; and thirdly, by the Turks under Amurath II. in 1430.

SALOOP. See SASSAFRAS.

SALOP. See SHROPSHIRE.

SALPA, a genus of Mollusca, of the division *Tunicata*, in which there is no shell, but a leathery tunic with two apertures; the type of the family *Salpida*, which float in the sea, and have the tunic transparent and elongated. They are allied to *Ascidia* (q. v.), although not fixed like them, and have two openings, through the hinder of which the water enters, and is expelled through the anterior by a regular contraction of the mantle, so that the animal is impelled through the water in a backward direction, without any apparent voluntary action. The *Salpa* are sometimes solitary, and sometimes united in long chains, those in chains having the contractions of the individuals simultaneous; but the solitary *Salpa* appear to be the parents of those which are in chains, and they in turn give birth to solitary individuals very different from themselves. The whole texture is very delicate, so that the animal is sometimes scarcely to be discerned, except from its iridescent hues in the sunshine, which make chains of *Salpa*, when very numerous, a conspicuous feature in the surface of the great deep in tropical regions. The orifices of the alimentary canal are not near together, as in *Ascidia*, but at opposite extremities of the body. The branchial chamber of *Ascidia* is represented by a wide membranous canal, traversed by a long vascular ribbon, which is continually exposed to the

water that passes through the canal. The *Salpa* united in chains have no organic connection, but apparently adhere together by little suckers.

SAL PRUNELLE. See NITRE.

SALSIFY, or **SALSIFY** (*Tragopogon porrifolius*), a biennial plant growing in meadows throughout Europe, not common, and perhaps not truly indigenous in Britain; cultivated in gardens for the sake of its root, which is used in the same manner as the carrot, and is very delicate and pleasant,

Salsify (*Tragopogon porrifolius*).

with a flavour resembling asparagus or scorzonera. The root is long and tapering, and in cultivation white and fleshy, with much white milky juice; the stem 3–4 feet high, with smooth and glaucous leaves, which resemble those of the leek; the flowers are of a dull purple colour. The seed of *S.* is sown in spring, and the root is ready for use in winter. In the following spring, when the flower-stalks are thrown up, they are used like asparagus. Owing to a peculiar mode in which the roots are sometimes dressed, so as to have a flavour somewhat like that of oysters, *S.* is sometimes popularly called the *Oyster Plant*.—The genus *Tragopogon* belongs to the natural order *Compositae*, suborder *Cichoraceae*, and is distinguished by one row of 8–10 bracts united at the base, a punctured receptacle, feathery pappus, and striated achenia with long beak.—The **PURPLE GOAT'S BEARD** (*T. pratensis*), a native of Britain, was formerly cultivated in England for its roots, which are similar in quality to salsify.

SALSETTÉ (native name *Sāshti*), an island on the west coast of British India, in the presidency of Bombay, lies immediately north of Bombay, with which it is connected by a long peninsula, and by an artificial embankment called Zion's Causeway. It is 18 miles long, and 11 miles in extreme breadth. Pop. about 50,000. It is beautiful, picturesque, and densely wooded, is diversified by mountain and hill, and contains many fertile tracts. Sugar, indigo, cotton, flax, and hemp are grown. Thanah, the chief town, stands on the east coast, 20 miles north-west of Bombay by the Great Indian Peninsular Railway, which, after traversing the islands of Bombay and *S.*, crosses to the continent half a mile to the south of this town. Pop. about 12,000. A number of remarkable caves, called the Caves of Kánhari or Kenery, are found in the middle of the island, five miles west of Thanah. They are nearly

a hundred in number, are all excavated in the face of a single hill, and contain elaborate carvings. The caves are in six stories, on the ledges of the mountain, and the stories are connected by rungs cut in the rock. The cave first approached consists of three chambers, one unfinished, and dates from the 9th or 10th c. A.D.; it contains no figures or carvings. The other caves contain numerous carved representations of Buddha, many of them of colossal size. Relics and inscriptions are also found. There are caves in several localities of the island, besides those at Kánhari—e. g., those of Montpenir, Matani, and Jageshwar. The caves are frequently the haunts of serpents and tigers. On the north of the coast, is the small watering-place of Gao Bandar, which has been designated the Montpelier of Bombay. The fort of Thanah and the fort of *S.* were taken by the English in 1774.

SALT, MANUFACTURE OF. See SODIUM. Common salt is either procured in the solid crystalline state called *Rock-salt* (q. v.), as a natural brine from wells or springs, or by the evaporation of sea-water. In the first case, it is obtained by mining, often at great depths, as at Northwich in Cheshire; at Saline Magdeburg, Berchtesgaden, and Wimpfen in Germany; many; Cracow in Poland; in the Punjab and other parts of the world.

Rock-salt almost always contains impurities, and therefore is dissolved in water, and the insoluble matters mixed with it are deposited at the bottom. The brine is then drawn off, and evaporated by artificial heat in large iron pans.

Natural brine is obtained at Droitwich and Saline in Worcestershire, and Nantwich in Cheshire. At Droitwich, the shaft is only sunk 175 feet, and the brine rises to the surface, and overflows; it is pumped. There are, however, reservoirs made for it into which it is pumped, and from which it is distributed to the various works, which are more than large sheds, with numerous openings in their roofs, to allow the steam free egress. Flues run from end to end of the floors, and on these rest iron evaporating-pans, which are about 65 feet long by 25 broad, and about 18 inches in depth. In other places, very deep shafts have been sunk, and the brine requires to be pumped from a great depth. The flues heat the brine nearly to boiling-point, and as a large surface is exposed, the evaporation is rapid, and the crystals are small, as in the case of table-salt. If, however, the heat is more gentle, the salt is coarser, and is fit for curing meat, fish, &c., and when very slow, a much coarser kind called *bay-salt*, is produced. Salt is obtained from sea-water in many parts of the world, and this is effected by simply evaporating it in brine-pans, or shallow square pools, dug on the shore for the purpose. When the evaporation has proceeded to a certain extent, the liquid assumes a reddish colour, a pellicle of salt forms on its surface, which cracks, and sinks down, to be followed by another, and the crystallisation then proceeds rapidly. When complete, the salt is removed to sheds open at the sides, and then piled in heaps, in order that the chloride of magnesium may be removed. This is very easy, for as it is extremely deliquescent, it liquefies by exposure to the atmosphere, and runs out. The salt is then redissolved and crystallised if great fineness is required.

SALTA, a town in the north-west of the Argentine Confederation, capital of a state of the same name, and about 150 miles distant from the Argentinian and Bolivian frontiers. It stands on the banks of the upper waters of the Salado, at the height of upwards of 3900 feet above sea-level, and even with this elevation its climate is unbearable.

SALT-CAKE—SALTS.

It is well built, contains a number of good edifices, and about 11,000 inhabitants.

SALT-CAKE is the term employed to designate the crude sulphate of soda made from oil of vitriol and common salt, and used in the preparation of carbonate of soda.

SALTCOATS, a seaport on the Firth of Clyde, county of Ayr, 30 miles S.S.W. of Glasgow. Though a shipping trade has declined, S. is a thriving place, and a great resort of sea-bathers. Fine sea-salt is manufactured. Pop. (1871) 4624.

SALTILLO, a city of Mexico, capital of the state of Coahuila, 250 miles west-south-west of Matamoros. It is regularly laid out, contains a public square and fountain, and carries on manufactures of blankets and ponchos. Pop. 8105. Seven miles south is Buena Vista, famous for the battle fought there, February 1847, when the Mexican forces were repulsed by an inferior United States army.

SALTING, the process by which animal and vegetable substances are preserved for food by the use of common salt. This is either done by rubbing salt into the flesh to be preserved, and repeating the process from time to time, until it has absorbed sufficient to arrest decomposition; or the meat is liquefied with a little water, and made into a brine, in which articles are placed until required for use, when a little soaking and washing removes the superfluous salt. Vegetables are only salted in the latter way; and continental nations use it extensively for the preservation of various kinds of vegetable food for winter consumption. A little saltpetre is often added, and very much increases the efficiency of the common salt. See **ANTISEPTICS**, on.

SALTIRE, one of the ordinaries in Heraldry, its name of uncertain etymology, representing a bend sinister conjoined with a bend dexter, or a cross salted transversely like the letter X. Like the other ordinaries, it probably originated, as Mr. Saché suggests, in the clamps and braces of the

Saltire.

shield. The form of the saltire has been assigned the cross on which St Andrew is said to have been crucified; hence the frequency of this ordinary in Scotch heraldry. A saltire is subject to the variations of being engrailed, invected, &c., and may be couped. When two or more saltires are borne on a shield, they are couped, not at right angles, but horizontally; and as they are always so treated, it is considered superfluous to blazon them as couped. Charges disposed in the form of a saltire are described as placed *saltireways*, or *in saltire*. The former term is more properly applied to two long charges, as swords or keys, placed across one another (in which case the rule is, that the sword in the dexter should be uppermost, unless otherwise blazoned); and the latter to five charges placed in a row, one, and two.

SALT LAKE CITY, the chief town and ecclesiastical capital of the Mormon territory of Utah, N. is on the east bank of the river Jordan, between the Utah and Great Salt Lake, 20 miles south

of the latter, and 4350 feet above the level of the sea, 650 miles east-north-east of San Francisco, and 1100 west of the Mississippi. It was settled by the Mormons (q.v.) in 1847, and contains 260 lots of ten acres each; 4 public squares; shaded streets 128 feet wide, through each of which flows a stream of pure water from the neighbouring mountains, 10,000 feet high, from which the gardens are irrigated. The houses are chiefly built of adobes, or sun-dried bricks, each wife in the polygamic families having a separate entrance. The principal edifices are the Mormon Temple, the Tithing-house or Treasury, and the Social Hall, which serves for ball-room and theatre. Pop. in 1860, 8218; in 1870, 10,894.

SALT OF SATURN, an old name for acetate of lead.

SALT OF SORREL, the common name for binoxalate of potash.

SALT OF TARTAR, a commercial name for carbonate of potash in a very crude form.

SALT OF TIN is the term employed by the dyer and calico-printer for protochloride of tin, which is extensively used as a mordant, and for the purpose of deoxidising indigo and the peroxides of iron and manganese.

SALT RANGE, or **KALABAGH MOUNTAINS**, a mountain range in the Punjab, India, lies in an east and west direction, in lat. 32° 30'—33° 20'. The range rises on the west bank of the Jhelum, runs west to the Indus, and after affording a passage to the river, reappears on its west side, and pursues the same direction till it meets with the Suleiman Mountains. The S. R. is about 200 miles in length, and varies from 2000 to 5000 feet in height. Its appearance is exceedingly bleak and barren; vegetation is seldom met with; there are no trees; and the bold and bare precipices which frequently occur, give to the range a forbidding aspect. Rock-salt is found in inexhaustible quantities, and so pure, that after being pounded, it is ready for use. Alum, iron ore, coal, gypsum, and limestone abound; gold-dust is washed down in the sands of the rivers, and graphite is also found.

SALT, SPIRITS OF, the old name for muriatic or hydrochloric acid.

SALTS, SMELLING, a preparation of carbonate of ammonia with some of the sweet-scented volatile oils, used as a restorative by persons suffering from faintness. The pungency of the ammonia is all that is useful, and the oils are added to make it more agreeable. Oils of lavender, lemon, cloves, and bergamot are those chiefly used. The celebrated Preston smelling-salts are scented with oils of cloves and pimento. The manufacture of ornamental bottles to contain this preparation is an important branch of the glass and silversmith's trades.

SALTS, THEORY OF. Any substance which is produced by the combination of a base with an acid, is commonly termed a *salt*. The base is in most cases a metallic oxide, which is capable of uniting with an acid, and of more or less completely neutralising the distinctive properties of the latter; in some cases, however, the base is non-metallic and organic in its nature, as in the case of ammonia, morphia, quinia, strychnia, creatinine, &c.

The salts derive their generic name from common salt, now known as chloride of sodium, but till the time of Davy regarded as a compound resulting from the union of hydrochloric (or as it was then termed, *muriatic*) acid and soda. See **SODIUM**. Davy, however, shewed that during their action upon each other, both the acid and the alkali undergo decomposition, and that while water is formed by the union of the oxygen of the alkali (NaO) and the

hydrogen of the acid (HCl), the sodium of the former combines with the chlorine of the latter to form chloride of sodium (NaCl). Hence, strangely enough, the very substance from which the salts derive their name as a class, was the means of overthrowing the old idea that a salt, as a matter of necessity, must result from the union of a base with an acid. It was then proposed to divide salts into two classes—those formed by the union of a base with an oxyacid, such as nitrate of potash (KO, NO_3), formed by the union of oxide of potassium with nitric acid, sulphate of soda (NaO, SO_4), carbonate of lime (CaO, CO_2), &c., which were termed *oxysalts*; while the other class consisted, like chloride of sodium, of a metal combined with the characteristic element (chlorine, iodine, bromine, fluorine) in a hydrogen acid or hydracid (as, for example, hydrochloric, hydriodic, hydrobromic, or hydrofluoric acid). The salts of this second class, of which chloride of potassium (KCl) and fluoride of calcium (CaF) may be quoted as examples, being constructed on the same plan or type as sea-salt, were termed *Haloid Salts* (q.v.), from the Greek word *hals*, the sea. The chlorine, iodine, bromine, or fluorine, which, in combination with a metal, forms a haloid salt, is by some writers termed a *salt-radical*.

The great resemblance in properties between the two classes of saline compounds, the haloid and oxysalts, has very naturally led to the supposition, that both might possibly be alike constituted; and that the latter, instead of being considered compounds of an oxide and an acid, might with greater propriety be considered to contain a metal in union with a compound salt-radical, having the chemical relations of chlorine and iodine. On this supposition, sulphate and nitrate of potash will be constituted in the same manner as chloride of potassium, the compound radical replacing the simple one.

Hydrated sulphuric acid will be, like hydrochloric acid, a hydride of a salt-radical, $\text{H} + \text{SO}_4$. When the latter acts upon metallic zinc, the hydrogen is simply displaced, and the metal substituted. No decomposition of water is supposed to occur, and consequently the difficulty of the old hypothesis is at an end. When the acid is poured upon a metallic oxide, the same reaction occurs as in the case of hydrochloric acid; water and a haloid salt are produced. All acids must be, in fact, hydrogen acids; and all salts haloid salts, with either simple or compound radicals.—Fownes's *Manual of Elementary Chemistry*, 9th ed., 1863, p. 269.

This view, which is frequently termed the *binary theory* of salts, was originally suggested by Davy, but it remained for many years nothing more than (to use the words of Professor Miller) 'an elegant hypothesis,' till it was further illustrated by certain of Liebig's researches in organic chemistry, and till, in certain special cases, it received direct confirmation from the voltaic researches of Daniell and Miller, who found that when a current from two or three of Grove's cells was transmitted through fused nitrate of silver (AgO, NO_3), the latter was resolved into crystals of silver (Ag) at one pole, and NO_2 (which at once broke up into red fumes of peroxide of nitrogen and free oxygen) at the other.

But although the binary theory serves to explain in the most satisfactory way many chemical changes, as, for example, the modifications of

phosphoric acid and phosphate of soda (see Miller's *Inorganic Chemistry*, 2d ed., 1860, p. 33; or Galloway's *Second Step in Chemistry*, 1864, pp. 128–130), there are many objections to it, and it will probably give place to other views regarding the constitution of salts. For a notice of these objections, we must refer to the above-mentioned works of Miller and Galloway. Some of our most eminent chemists, as, for example, the editors of Fownes's *Manual*, take a more hopeful view. According to Drs Bence Jones and Hofmann, 'the general application of the binary theory so far presents a few difficulties. But it is very probable that the progress of discovery will ultimately lead to its universal adoption, which would greatly simplify many parts of the science.'

The salts may be arranged according to the mode of composition into:

1. *Neutral or Normal Salts*; 2. *Acid Salts*; 3. *Basic Salts*. A salt is *neutral* which is composed of as many atoms or equivalents of the acid as there are of oxygen in the metallic base. If the base is a protoxide, or contains 1 atom of oxygen, 1 atom of the acid is combined with it. Sulphate of potash (KO, SO_4), nitrate of copper (CuO, NO_3), and carbonate of potash (KO, CO_3) are all neutral in their composition, each consisting of one atom of the acid in combination with one atom of a metallic protoxide. But all these salts are not neutral, if we judge of their neutrality by their exerting no action on litmus or turmeric paper, for while the first is neutral to test-paper, the second exhibits an acid, and the third an alkalic reaction; and hence the use of the term *normal* in preference to that of *neutral*, as applied to this class, has been judiciously advocated by Miller and other chemists. If the base is a sesquioxide, three atoms of the acid combine with one atom of the base to form a neutral or normal salt: thus the sulphates of alumina and of sesquioxide of iron are represented by the formulae $\text{Al}_2\text{O}_3, 3\text{SO}_4$, and $\text{Fe}_2\text{O}_3, 3\text{SO}_4$; and as these salts not only red litmus, but have an acid taste, they afford an additional reason for our preference to the term *normal* over *neutral* salts.

Acid Salts are generally formed by dissolving normal salts in the same kind of acid which they contain, by which means a new salt is often formed by no means always formed. Thus, if a sulphate of potash (KO, SO_4) be dissolved in sulphuric acid, tablets of a new and strongly acid salt will appear as the solution cools. The crystals consist of bisulphate or acid sulphate of potash, and their composition is represented by the formula $\text{KO}, \text{H}_2\text{SO}_4$, or $\text{KO}, \text{SO}_4 + \text{HO}, \text{SO}_4$, in which the atom of water may be regarded as acting as the character of a weak base. If a similar experiment is made of dissolving nitrate of potash in nitric acid, no new salt will be formed, the crystals remaining unchanged. Why some acids have the power of forming acid salts, and others should not possess the property, is unknown.

In *Basic Salts*, or *Sub-salts*, as they are sometimes termed, the proportion of base predominates over that of the acid, there being two or three or more atoms of the basic oxide combined with one atom of the acid. Thus, nitric acid forms with oxide of lead not only the normal salt, PbO, NO_3 , but three basic salts—viz., $2\text{PbO}, \text{NO}_3$, $3\text{PbO}, \text{NO}_3$, and $6\text{PbO}, \text{NO}_3$. Sulphuric acid forms with oxide of mercury not only the normal salt, HgO, SO_4 , but the basic salt commonly known as *turpethum*, and represented by the formula $3\text{HgO}, \text{SO}_4$.

There is one other class of salts requiring a little notice—viz., the *Double Salts*. Many double salts containing the same acid, but different bases

may be made to combine so as to form salts of the class now under consideration. Thus, sulphate of potash and sulphate of alumina (both of which are neutral sulphates) by combining, give rise to the double salt popularly known as alum, and represented by the formula $\text{K}_2\text{SO}_4 + \text{Al}_2\text{O}_3 \cdot 3\text{SO}_3 + 24 \text{ Aq.}$ Similarly, double salts of silicic acid are of common occurrence. Thus, the varieties of felspar are double silicates of alumina with potash, soda, lithia, or lime, but most commonly with potash, and they may be represented by the general formula $\text{MO} \cdot \text{SiO}_2 + \text{Al}_2\text{O}_3 \cdot 3\text{SiO}_2$, where MO stands for potash, soda, &c.

The salts at ordinary temperatures are solid bodies, with a strong tendency to crystallisation, although a considerable number are amorphous. They may be either colourless or coloured. When a colourless acid combines with a colourless base, the resulting salt does not exhibit colour. A coloured base combining with a colourless acid transmits its colour to the resulting salts, and if a coloured acid combine with a colourless base, a similar but less marked result ensues. The salts usually have a decided taste, which is usually dependent on the base; the sulphites are, however, an exception to this rule, as their taste resembles that of the acid. They are variously influenced by high temperatures: some remain unchanged; while others volatilise, fuse, and either simply lose their water of crystallisation, or become decomposed. Most salts are soluble in water, and some, as, for example, carbonate of potash and chloride of calcium, have so strong a tendency to dissolve in that fluid, that they abstract the moisture of the atmosphere. Such salts are termed *deliquescent*. As a general rule, hot water exerts a far more powerful solvent action than cold. There are, however, some remarkable exceptions to this law. Thus, the solubility of common salt (chloride of sodium) is very nearly the same, whatever be the temperature of the water, and certain salts of lime are more soluble in cold than in hot water.

It has been already shewn that an atom of water enters into the composition of certain salts in precisely the same way as an atom of potash or any other base. Such water is termed *basic water*, and is an integral constituent of the salt, from which it cannot be expelled by an ordinary heat. This water is quite distinct from the water of crystallisation, which is taken up by many salts in a definite quantity, when crystallising from water, and which is readily expelled by a gentle heat without altering the chemical properties of the salt. The crystalline form of salts which contain water of crystallisation is much influenced by the proportion in which the latter occurs. Thus, green vitriol (sulphate of iron) crystallises in two different forms and with two different proportions of water according to the temperature at which the salt separates from its solution. The number of equivalents of water of crystallisation may vary from 1 to 24, which is the highest number yet observed. In order to distinguish the water of crystallisation from water acting as a base, we characterise it by the symbol Aq. (from the Latin *aqua*, water). The ordinary phosphate of soda is represented by the formula $2\text{NaO} \cdot \text{HO} \cdot \text{PO}_3 + 24 \text{ Aq.}$ Many salts which contain water of crystallisation (for example, sulphate or carbonate of soda) give off the whole or a part of their water of crystallisation in a dry atmosphere, and crumble to powder; such salts are said to *effloresce*. Salts which contain no water of crystallisation are termed *anhydrous*; of which nitre (KNO_3) is an example. All salts, when dissolved in water, are readily decomposed by the electric current, the base going to the negative, and the acid to the positive

pole. In consequence of this result, the acid is termed the electro-negative, and the base the electro-positive constituent of the salts. When a haloid salt is similarly treated, the halogen (chlorine, &c.) is separated at the positive pole, while the metal is liberated at the negative pole.

SALTWORT (*Salsola*), a genus of plants of the natural order *Chenopodiaceae*, having hermaphrodite flowers, with 5-parted perianth, and a transverse appendage at the base of each of its segments, five stamens and two styles, the seed with a simple integument. The species are numerous, mostly natives of salt-marshes and sea-shores, widely

Prickly Saltwort (*Salsola kali*).

diffused. One only, PRICKLY S. (*S. kali*), is found in Britain. It has herbaceous prostrate much-branched stems, awl-shaped spine-pointed leaves, and axillary solitary greenish flowers. It was formerly collected in considerable quantities on the western shores of Britain, to be burned for the sake of the soda which it thus yields. *S. sativa* is the chief Barilla (q. v.) plant of the south of Spain.

SALUTE is a compliment paid in the Navy and Army, when a royal or other distinguished personage presents himself, when squadrons or armed bodies meet, when officers are buried, and on many other ceremonial occasions. There are several modes of saluting: firing great guns and small-arms, dipping colours, flags, and topsails, presenting arms, manning the yards, cheering, &c. A royal salute consists in the firing of 21 great guns; in the lowering by officers of their sword-points, and the dipping of the colours. Persons of less elevated rank, entitled to be saluted, receive less extensive honours. A form of salute of more frequent occurrence is when a soldier 'presents arms.' The various forms of military salute, such as the firing of guns, lowering swords, and presenting arms alike render the ship or soldier so doing powerless for aggression. They thus symbolise friendliness, the putting of yourself in the power of the person saluted, submission.

SALUZZO, an episcopal city of Northern Italy, in the province of Cuneo, at the foot of the Alps, 22 miles east of Mount Viso. It is a fine old city, and contains a semi-Gothic cathedral built in 1480, with pillars of rare marbles, and colossal statues exquisitely sculptured, a seminary for priests, a royal college, and several elementary and infant schools. The Tower of the Commune, an ancient and singular

building, is worthy of notice; also the Abbey of Staffarda, founded in 1135 by the Marquis Tommaso I., and destroyed in 1341; an ancient civic palace, and the old castle, formerly the residence of the marquises of Saluzzo, now a penitentiary. Its products are grain, hemp, and wine; and its manufactures are silk fabrics, iron goods, and hats. Pop. 16,208.

SALVAGE (from Lat. *salvare*, to save) is the payment due by the owner of a ship or cargo to persons who may have been instrumental in saving it from extraordinary danger—from the sea, fire, or an enemy. The propriety of this allowance as an incentive to the saving of life and property, has always been admitted; and though the correctness of the principle which allows salvage to royal ships for saving vessels of their own nation, may be questioned on the ground that their duty is to protect such ships under all circumstances, yet it is admittedly expedient to offer a fair pecuniary reward as an additional incentive to what may often be an irksome duty.

Salvage was recognised in the earliest maritime codes—as in the laws of Rhodes, Oleron, and Wisby. The law of England divides it into two classes, civil and hostile salvage. *Civil Salvage* is saving a vessel or her cargo, or part thereof, from the perils of the deep; hostile salvage recovers it from an enemy or pirate after capture. No proportion is laid down in civil salvage, as generally applicable. Each case must be decided on its own merits, the ingredients for decision being, 1st, the degree of danger incurred by the salvors; 2d, the degree of peril in which the property rescued stood; 3d, the degree of skill, labour, and time evinced in the salvage; 4th, the value and nature of the property. Except where the assistance rendered has been trifling, the salvage usually ranges from a third to a half of the property saved. A contract to render assistance negatives any claim to salvage on account of such assistance. A passenger can only claim salvage when, having had the opportunity, while the danger existed, of quitting the ship, he voluntarily remains to render help. A royal ship is bound to aid a merchantman in distress; but it can still claim salvage.

When the parties cannot agree as to the amount of salvage, the Admiralty Court has jurisdiction over all cases which occurred at sea, or between high and low water mark. The rules for trying salvage cases are fixed by the statute 16 and 17 Vict. c. 131 (1853).

Hostile Salvage is fixed by 43 Geo. III. c. 160 (1803) at one-eighth the value of the property saved for royal ships, and one-sixth for private vessels. Ships and merchandise taken from pirates pay one-eighth as salvage, 6 Geo. IV. c. 19 (1826).

In the case of saving a vessel belonging to an allied or neutral power, reference is made in awarding salvage to the laws of such power, and to the degree of reciprocity it grants to British vessels.

SALVÉ REGINA, the first words of one of the most popular prayers in the Roman Catholic Church, addressed to the Blessed Virgin Mary. It forms part of the daily office of the Roman Breviary, and is recited at the end of 'Lauds' and of 'Complin.' But it is still more in use as a prayer of private devotion, and concludes with an earnest and tender appeal for the intercession of the Blessed Virgin with her Son, 'that we may be made worthy of the promises of Christ.'

SALVO is a concentrated fire from a greater or less number of pieces of artillery. Against a body of men, a salvo is generally useless, as the moral effect is greater in proportion to the area over which

devastation is spread; but with fortifications the case is otherwise. For the purpose of breaching the simultaneous concussion of a number of cannon balls on masonry, or even earth-work, produces a very destructive result. At Almeida, after the French had fired a few salvos of 65 guns, the castle sunk in a shapeless mass. The effect of a salvo of modern artillery, with its enormous steel shot against iron-plated ramparts, has never yet been tried in actual war. The concentrated fire of a ship's broadside forms a powerful salvo.

SALZBRUNN, the name of three villages, *NIEDER*, and *OBER S.*, in Prussian Silesia, 37 miles south-west of Breslau. The villages are dull, and worthy of notice only from their eight mineral springs, and their much-frequented baths. About 2,500,000 bottles of alkali-saline water are annually exported. Pop. in all, from 2000 to 3000.

SALZBURG, a crown-land in the west of Austria, bounded on the west partly by Bavaria, and partly by the Tyrol. Area, 2765 sq. m.; (1870) 153,160. The principal mountain-ranges are the Noric Alps, which traverse the south of Salzb. west to east, and rise in the Grossglockner to a height of 12,360 feet; and branches of the Rhenish Alps, which separate the Tyrol from S., and run throughout the middle districts of the latter, rising in the Ewiger Schneeberg to 9580 feet. Snows and glaciers occur in the more elevated regions. The chief river, the Salza, drains the greater part of the crown-land, flows first east, then north, and is 147 miles in length. The climate is cold and variable, but healthy, and although, of the whole area, 2000 sq. m. are capable of bearing crops, the crown-land is inferior to most of the provinces of the monarchy in quantity and value of produce. The rearing of cattle and horses is an important branch of industry. Salt is obtained in large quantities, especially at Hallé (q. v.). Salzburg is the capital.

SALZBURG (anc. *Juvavia*), perhaps the most charmingly situated town in Germany, is the capital of the Austrian crown-land of the same name, and stands on both banks; but chiefly on the left bank of the Salza, 190 miles west-south-west of Vienna by railway. Here the river, banked on both sides by precipitous crags, rushes through what seems to be a natural gateway, and then northward to its junction with the Inn. The picturesque situation of the city is thus described by Wilkie: 'It is Edinburgh Castle and the Old Town brought within the cliffs of the Trossachs, and watered by a river like the Tay.' The heights on either bank of the Salza are crowned with edifices. On the left, called the Mönchsberg, is surmounted by the castle, called Hohen-Salzburg, an irregular feudal citadel of the 11th c., and, during the middle ages, the residence of the archbishops of S., who combined the dignity of princes of the German empire with their ecclesiastical rank. The castle itself is now dismantled, but still serves as a barrack. A statue of Mozart (q. v.) adorns one of the squares. Opposite Mönchsberg is the Capuzinerberg, with a convent. The cathedral, a large and beautiful Italian edifice, was built in the early part of the 17th century. The architectural taste of the archbishops has adorned the city with many beautiful edifices, chiefly in the Italian style. The city is surrounded by walls, here and there dismantled, and the bastions are for the most part in a state of decay. The city is the seat of an archbishop, and contains numerous libraries, museums, and educational and other institutions, among which is an upper gymnasium, and the *Mozarteum*. It carries on manufactures to some extent, is in communication

SALZKAMMERGUT—SAMARIA.

with Vienna, Munich, and Innsbruck by railway, and has a considerable transit-trade. Pop. (1870) 14,615.

SALZKA'MMERGUT, called also the *Austrian Switzerland*, one of the most picturesque districts of Europe, forms the south-west angle of the crown-land of Austria ob der Enns, between the crown-lands of Salzburg on the west, and Styria on the east. Area, 249 sq. m.; population, 18,000, of whom 6500 are Protestants. The scenery combines in rare beauty the usual features of valley, mountain, and lake. The vales are clothed with a rich verdure, and are studded with clumps of fruit and forest trees; the mountains are covered with beeches and oaks; higher up with pines and larches, and in some instances are topped with everlasting snow. The highest peak, Grosse Priel, reaches an altitude of 7931 feet. But the district derives its reputation for beauty chiefly from its lakes, the largest and most famous of which are the Hallstadt and the Traun, or Gmunden lakes. They are bordered with lofty mountains, which rise sheer from the surface of the water; and their pit-like character, and the strong light and shade thrown on them from the mountains, combine to render the scenery, of which they form the centre, unusually sublime. The Hallstadt and Traun lakes are connected, and indeed formed by the river Traun. The district of S. derives its name from the salt which is obtained in enormous quantities from its springs and mines. Salt being a government monopoly in Austria, the works are under the management of the *Kammer*, or exchequer. From 6000 to 7000 of the inhabitants are employed in the salt-works, and the amount annually obtained is near 50,000 tons. The chief seats of the salt-works are Ischl (q.v.) and Hallstadt. Little or no agriculture is carried on in the S., and the inhabitants not engaged in the main industry of the district are engaged in cattle-breeding and in the timber trade.

SALZWEDEL, a small manufacturing town of Prussian Saxony, 54 miles north-north-west of Magdeburg, on the Jeetze. It carries on sugar-refining, and manufactures of linen, woollen, and cotton fabrics. Pop. (1871) 8381.

SAMANI AND DILEMI were two dynasties which divided between them the kingdom of Persia towards the beginning of the 10th century. They both rose to power through the favour of the califs, but they speedily threw off the yoke. The Dilemi, divided into two branches, exercised sovereign authority in Kerman, Irak, Fars, Khuzistan, and Laristan, always acknowledging their nominal dependence on the calif; and during the whole period of their rule, one of the southern branch of this family was vested with the dignity of *emir-ul-gunnar*, or vizier, and managed the affairs of the califate. Several of the Dilemi were able and wise rulers, as the remains of their works of irrigation and other structures amply testify; but Mahmud of Ghizni put an end to the rule of the northern branch in 1029, and the Seljuks subjugated the southern one in 1056, by the capture of Bagdad, their last stronghold. Their more powerful rivals, the Samani, had obtained from the calif the government of Transoxiana in 874 A.D.; and to this, Ismail, the most celebrated prince of the family, speedily added Khaurezmi, Balkh, Khorassan, Seistan, and many portions of Northern Turkestan. Rebellions of provincial governors distracted the Samanide monarchy towards the end of the 10th c., and in 999 A.D. their dominions north of Persia were taken possession of by the khan of Kashgar, the Persian provinces being added by Mahmud of Ghizni to his dominions.

SAMAR, one of the Philippine Islands (q.v.).

SAMARA', a frontier government of Russia, bounded on the E. by the Kirghiz Steppes, and on the W. by the governments of Saratov Simbirsk, and Kazan. Area, 64,953 sq. m.; pop. 1,743,422. It was erected into a government by ukase of December 1850, and was formed out of portions of the governments of Simbirsk, Orenburg, and Saratov. The Volga, which forms the western boundary, and its affluent, the Samara, are the chief rivers. The country is very fertile, and agriculture and fishing are among the chief employments of the inhabitants. Only a comparatively small portion of the country is colonised. Chief town Samara (q.v.).

SAMARA, capital of the Russian government of the same name, on the left bank of the Volga, at the junction of that river with the Samara. It is the chief grain-market on the Volga, and it contains numerous storehouses, especially for grain. A good trade in salt, fish, caviare, and tallow is also carried on. From S. comes a great number of lambs' skins, which are famous for their fineness. Pop. 34,500.

SAMARA'NG, an important seaport on the north of Java, 385 miles (by steamboat course), east of Batavia, in 6° 57' 20" S. lat., and 110° 26' 30" E. long., is the capital of the Residency, and the point to which the produce of Middle Java is brought for exportation to Europe. Pop. 30,000. The city lies on the right bank of the river Samarang, a shallow, muddy stream 90 feet in breadth. The Chinese, Malays, and Arabians have their own captains, and separate quarters of small, dark, dirty houses. The 1600 Europeans dwell partly along the sea-shore, but chiefly on the left side of the river, by the shady road to Bodjong, the resident's house, which is two miles from the city. The Protestants and Roman Catholics have each a church, orphan-house, and school. There are 3 public and 12 private schools, an excellent hospital for 550 patients, and other charitable institutions.

Only small vessels can enter the river. The roadstead is exposed to the west wind, and is dangerous during the rainy season. Besides the usual trades, the natives work in gold, silver, copper, and tin. Coffee, rice, sugar, tobacco, and indigo are the chief exports, an agent of the Netherlands Trading Company (q.v.) being established at S. to attend to the government trade.

In 1860, the pop. of the residency of S. amounted to 970,201 souls, 3765 being European, and 10,730 Chinese.

SAMARIA (Heb. *Shomerón*, Chald. *Shamrayin*, Septuagint, *Samaria*, *Semerón*, &c.), anciently a city of Palestine, the chief seat of the Ephraimitic Baal-worship, and, from the seventh year of Omri's reign, the capital of the kingdom of Israel. It was beautifully situated on a hill about six miles north-west of Shechem, and probably derived its name (which may be interpreted 'pertaining to a watch' or a 'watch-mountain') from the position of the hill, which rises from the centre of a wide valley, and commands an extensive prospect; but an eponymous etymology is adopted by the writer of 1st Kings, who says (chap. xvi. verse 24): 'And he [Omri] bought the hill Samaria of Shemer for two talents of silver, and built on the hill, and called the name of the city which he built, after the name of Shemer, owner of the hill, Samaria.' The date assigned to Omri's purchase is 925 B.C., from which time S. became the seat of government, which had been formerly at Thirsa. It was twice besieged by the Syrians (901 B.C., and 892 B.C.), under Ahab and Joram, on both occasions unsuccessfully; but in 721 (720) B.C., it was stormed by Shalmaneser, king of Assyria, after a three years' siege. Its inhabitants, together with those of all the other

'cities of Samaria' (which had become the general name for the country itself in which the city stood), i. e., the kingdom of Israel—or the 'ten tribes'—were then carried off into a captivity from which they never returned. Their place was supplied, after a time, by colonists, planted there by Shalmaneser and Esarhaddon, from Babylon, Cuthah, Ava, Hamath, and Sepharvaim (according to 2d Kings, chap. xvii. verse 24; Media and Persia, Josephus's *Antiquities*, x. 9, 7), who constituted the original body of the people subsequently known as Samaritans, but whose bulk was gradually increased by accessions of renegade Jews and others. The question has been much, and on the whole unprofitably, discussed, whether these so-called 'Samaritans' were a mixed race of remnant Israelites and heathen Assyrians, or whether they were exclusively the latter. The mere language of Scripture, strictly construed, seems to favour the second of these views, unless the term 'cities' of 2d Kings, xvii. 24, is intended to imply that the ancient inhabitants dwelt in the open country. On the other hand, we find, apart from the other reasons against so unparalleled a wholesale deportation, Israelitish inhabitants under Hezekiah and Josiah, both in Ephraim and Manasseh. Modern authorities therefore assume that they were, to a certain extent, what they always insisted on being, Israelites—(not Jews), i. e., a people largely intermixed with Israelitish elements, that, during the exile, had adopted the worship of Jehovah. The returning Jews, however, would not recognise their claims to the participation in the national *cultus* and temple, and a bitter antagonism sprang up between the two nationalities. In 409 B.C., a rival temple was erected on Mount Gerizim, and a rival priesthood and ritual organised, and henceforth the breach, for some periods at least, became apparently irreparable—the Jews had no dealings with the Samaritans, and *vice versa*. At other periods, however, a more friendly intercourse seems to have taken place between them. The rabbinical laws respecting the 'Kushites' (Cuthim), as they were called by the later Jews, are therefore strangely contradictory, and their discrepancies can only be explained partly by the ever-shifting phases of their mutual relations, and partly by the modifications brought about in the Samaritan creed itself. The later history of the city of S. is somewhat checkered. It was captured by Alexander the Great, when the 'Samaritan' inhabitants were driven out, and their place supplied by Syro-Macedonians. It was again taken (109 B.C.) by John Hyrcanus, who completely destroyed it. Soon rebuilt, it remained for the next 50 years in possession of the Jews; but Pompey, in his victorious march, restored it to the descendants of the expelled Samaritans, who had settled in the neighbourhood, and it was refortified by Gabinius. Herod the Great rebuilt it with considerable splendour, and called it Sebaste, in honour of the Emperor Augustus, from whom he had received it as a present. In the 3d c., it became a Roman colony and an episcopal See. Its prosperity perished with the Mohammedan conquest of Palestine; and at present, it is only a small village called Sebastieh, an Arab corruption of Sebaste, but contains a few relics of its former greatness. 'Samaritans,' as a religious sect, still exist at Nablus (anc. Shechem), as they have existed in the district uninterruptedly through all the vicissitudes of war and conquest from the time of Christ. Their present creed and form of worship agree in many particulars with that of the so-called 'rabbinical' Jews, although the Samaritans pretend utterly to reject the 'Traditions.' They alone, however, have retained the paschal sacrifice of a lamb. The language of the ancient Samaritans

is a Hebræo-Aramaic dialect, but contains a number of non-Semitic (Cuthæan) words. It only survives in a few fragments of ancient literature, a translation of the Pentateuch, and some liturgical pieces. The present inhabitants speak Arabic.—See Dr Robinson's *Biblical Researches*, Rammey's *Palæstina*, and Dean Stanley's *Sinai and Palestine*, &c.

SAMA'RITAN PENTATEUCH, a recension of the commonly received Hebrew text of the Mosaic law, in use with the Samaritans, and their canonical book of the Old Testament. Some vague allusions in some of the Church Fathers (Origen, Jerome, Eusebius), and one or two more distinct but less generally known Talmudical utterances respecting this recension, were all the information available up to the early part of the 17th c. (1616, when Pietro della Valle acquired a complete copy from the Samaritans in Damascus. Since then, the number of manuscripts of the Samaritan Pentateuch, with and without translations (in Arabic), has considerably increased in European libraries; as fragments, consisting of special books or chapters, are of the most frequent occurrence. In fact, writing portions of Samaritan Pentateuch on the skins of animals, would, in the face of the great demand for the article on the part of ignorant Europeans, especially English, travellers, appear to be a favour and lucrative pastime, if not an established trade and business, among the modern Samaritans.

These MSS. are written in the Samaritan character, a kind of ancient Hebrew writing, probably in use before, and partly after the Babylonian exile, and vary in size from octavo to folio, the writing being proportionately smaller or larger. Their material is vellum, or cotton paper, and the ink used is black, with the exception of the Names of God, which is written in gold. There are no vowels, accents, nor diacritical points, the single words are divided from each other by dots. None of the MSS. that have reached Europe are older than the 10th century. The Samaritan Pentateuch was first edited by J. Morinus in the *Paris Paris* (pt. iv. 1632) from one codex (whence it found its way into Walton), and was last re-edited, written in the square Hebrew characters, by B. Blayney, Oxford, 1790. The first publication of this sacred document, and principally the *Exercitationes Theologice*, with which J. Morinus accompanied it, marked a certain epoch in modern biblical investigation; for, incredible as it now appears, it was placed by Morinus and his followers far above the received Hebrew text, which was said to have been corrupted from it. As reasons for this, were adduced its supposed superior 'lucidity and harmony' and its agreement with the Septuagint in many places. This opinion, which could only have been entertained by men devoid of knowledge, was zealously cherished, and fiercely combated for exactly 200 years, when the first proper and scientific investigation (by Gesenius) set it at rest. For all, among the learned world at least, the absurd notion chiefly owed its popularity to anti-Jewish as well as anti-Protestant tendencies; its supporters, to whom every attack against the received form of the text—that text upon which alone the Reformers professed to take their stand—was an argument in favour of the Roman Catholic dogma as to the 'Rule of Faith' (q.v.). It boasted superiority *en bloc*, gradually divided down to two or three passages, in which the Samaritan reading seemed preferable, and these have now been disposed of in favour of the authorised Masoretic text. The variants, which Gesenius was the first to arrange systematically, present simply the ordinary aspect of partial and conscious, partly unconscious corruptions. They

arose, for the greatest part, from an imperfect knowledge of the first elements of grammar and exegesis. Others owe their existence to a studied design of conforming certain passages to the Samaritan mode of thought, speech, and faith, more especially to shew that Mount Gerizim was the spot chosen by Jehovah for his temple. There are, however, only two essential alterations respecting the Mosaic ordinances themselves to be found, one, Exod. xiii. 7, where the Samaritan Pentateuch has 'six days shalt thou eat unleavened bread,' instead of 'seven;' and Deut. xxiii. 17, where our 'shall be no' is altered into 'shall not live.' A chronological peculiarity deserves special mention—viz., that no one in the antediluvian times begets his first son in the Samaritan Pentateuch after the age of 150, either the father's or the son's age being altered in proportion; after the Deluge, however, the opposite method is followed of adding 50 or 100 years to the father's years before the begetting of a son. We will only further add that anthropomorphisms, as well as anthropopathisms, are most carefully expunged, and that in Deut. xxvii. 4, Gerizim is wilfully substituted for Ebal.

It is, in the absence of a critical edition, exceedingly difficult to do more than speculate on the age and origin of the Samaritan Pentateuch, and opinions remain indeed widely divergent. The principal opinions on the subject are, briefly, either that it came into the hands of the Samaritans as a natural inheritance from the Jewish people, whom they succeeded at the time of the Babylonish exile; or that it was brought to them by Manasse (Jos. Ant. xi. 8, s. 2, 4), when the Samaritan sanctuary on Mount Gerizim was founded; or, again, that the Israelitish priest sent by the king of Assyria to instruct the new settlers in the religion of the country, brought it with him. Of other more or less isolated opinions, only that one deserves further notice, that it was a late and faulty recension, into which glosses from the LXX. (Septuagint) were received. This agreement between the LXX. and the Samaritan Pentateuch, to which we have already alluded, has likewise given rise to many speculations and suggestions. The foremost of these are, that the LXX. have translated from the Samaritan Pentateuch; that mutual interpolations have taken place; that both versions were formed from Hebrew copies, differing among themselves, as well as from the authorised recension; and that many wilful corruptions have been superadded at a later time; finally, that the Samaritan has been altered from the LXX. There is also a translation of the Samaritan Pentateuch (which is Hebrew) into the Samaritan idiom; it is ascribed by the Samaritans to their high-priest, Nathaniel, who died 20 years before Christ. It was probably a kind of popular version, like the Targums (q. v.), and was composed, very likely, shortly before the destruction of the second temple. The translation is done in the most slavish and incompetent manner. Another Arabic version is due to Abu Said, in Egypt (1070), based on Saadiah's translation; and to this Samaritan-Arabic translation, a Syrian, Abu Barachat, wrote, in 1208, a commentary, which is sometimes erroneously taken to be an independent Syriac version of the Samaritan Pentateuch. Among the principal modern writers on the Samaritan Pentateuch are Gesenius, Kirchheim, and Deutsch.

SAMARKAND was in the 14th c. the capital of the great Tartar empire of Timur. It has since remained the centre of Mohammedan learning in Central Asia. It was till 1868 the second city of the khanate of Bokhara, and since that period annexed to the dominions of the Czar, it has become one of the chief towns of Russian Turkestan. It is

in lat. 40° 2' N., and long. 67° 3' E., 4 English miles south of the Zer-Afshan (a river which 'loses itself in the sands'), and 145 miles nearly east-by-north from Bokhara. It is situated at the foot of Mount Chobanata, in a plain of exuberant fertility; and when seen from a distance, its glittering minarets, lofty domes, and prominent edifices and ruins, relieved by the brilliant green of the closely-planted gardens interspersed within the walls, present an imposing effect. The river for centuries has been changing its course, and S. has followed it—so that it consists of a 'new city,' and the ruins of those which preceded it. The 'new city' is surrounded with walls, pierced with six gates, and is filled with narrow streets and lanes, which have, however, undergone many improvements since the Russian occupation. The population, which in the 14th c. exceeded 100,000, has dwindled to 20,000. The inhabitants consist chiefly of Tajiks and Usbeks. They are chiefly employed in the manufacture of silk, wool, and leather. The old or 'ruined city' is the portion most interesting to Europeans, as the capital of that mighty conqueror who wielded the sceptre of Asia from China to the Hellespont. Many of the ruins belong to this epoch, among which are the Hazreti Shah Zinde, at one time supposed to have been a summer palace of Timur, but now shewn to have consisted of tombs and chapels only. In the centre of the city, separated from each other by a wide open space, stand three medresses, or sacred colleges. Each consists of a large quadrangular court, surrounded by a range of two-storied buildings, with chambers occupied by teachers and pupils. One of the objects of interest in S. is the palace of the Emirs of Bokhara, built within the citadel, where, before the Russian conquest, they were in the habit of spending the summer months with their harem suite. In one of the courts is the famous Kuk-tash, or green-stone, which served as Timur's throne. The palace has now been converted by the Russians into an hospital. S. was the ancient *Maracanda*, the capital of Sogdiana. It was seized by the Arabs, 707 A.D., and from this time belonged either to the califate or to some of the dynasties which were offshoots from it, till 1219, when it was taken by Genghiz Khan. In 1359 it was captured by Timur, and ten years afterwards became the capital of his empire. It remained the chief town of Turkestan till 1468, when it declined in importance with the rise of the Usbeks. It retained, however, its position as the chief seat of Mohammedan learning in Asia. Until recently it had been visited by only four Europeans—in 1404 by the Spaniard Clavijo, in 1841 by Lehmann and Chanykow, and in 1863 by Vambéry. But in May 1868, the gates of S. were opened to the Russians (see BOKHARA), and they have since retained possession of the city. The inhabitants have manifested less antipathy to the rule of the infidel than might have been expected, from the reputation of S. as a seat of Mohammedan fanaticism. The Jews have prospered by the encouragement given to trade; and the Tajik population have shewn, as in the other cities of Turkestan annexed by Russia, goodwill towards their conquerors, and a desire to adopt European ideas.—See Vambéry's *Travels in Central Asia* (Lond. 1864), and paper on 'Ruins of Samarkand,' by Professor Fedchenko, in *Proceedings of Royal Geographical Society*, December 1871.

S'AMAVEDA is the name of one of the four Vedas. See VEDA.

SAMBAS. See PONTIANAK.

SAMBOO, or SAMBUR. See RUSA.

SAMMATIYA is one of the four divisions

the *Vaiśāḍhika* system of Buddhism; its reputed founder was *Upāli*, a disciple of the Buddha, *S'ākyamuni*.—See C. F. Koeppe, *Die Religion des Buddha* (Berlin, 1857); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St Petersburg, 1860).

SAMNITES, an ancient Italian people of Sabine origin, who occupied an extensive and mountainous region in the interior of Southern Italy. They were surrounded on the north by the Peligni, Marsi, and Marrucini; on the west and south-west by the Latins, Volscians, Sidicini, and Campanians; on the south by the Lucanians; and on the east by the Apulians and Frentani. The S. were divided into four nations: 1. The *Caraceni* in the north, whose capital was Aufidena. 2. The *Pentri* in the centre, whose capital was Bovianum, and who constituted the most powerful nation of the Samnite stock. 3. The *Caudini*, in the south-west. 4. The *Hirpini* in the south, whose capital was Beneventum. For an account of their origin, ethnological affinities, and history, see *ROME, HISTORY OF*.

SAMOAN ISLANDS. See *NAVIGATORS' ISLANDS*.

SA'MOS (Mod. Gr. *Samo*; Turk. *Susam Adasi*), an island in the *Ægean* Sea, is situated about a mile off the coast of Asia Minor, in the Bay of Scal-anova, about 45 miles south-south-west of Smyrna. Its length is 30 miles; its mean breadth about 8 miles. A range of mountains, which may be regarded as an insular continuation of Mount Mycale, on the mainland, runs through the whole island, whence its name—Samos, being an old Greek word for any height in the neighbourhood of the sea. The highest peak, Mount Kerkis (anc. *Cerceteus*), reaches an elevation of 4725 feet. S. is still, as in ancient times, well wooded. Between its eastern extremity and the mainland lies the narrow channel of Mycale (called by the Turks the *Little Boghaz*), where, in 479 B.C., the Persians were totally defeated by the Greeks under the Spartan Leoty-chides. Between the island and Nicaria (anc. *Icaria*), on the west is the *Great Boghaz*, from 3 to 8 miles broad, and much frequented by vessels sailing from the Dardanelles to Syria and Egypt. S. is well watered and very fertile, exporting considerable quantities of corn, grapes, wine, oil, valonia, &c.; its mountains furnish quarries of marble. The present capital, called Khora ('the town'), is situated on the south side of the island, at the base of a hill (about 2 miles from the sea), on which ruins of the ancient acropolis (*Astypalaia*) are still visible. On the north coast lies Vathy or Bathys, which derives its name from its deep (Gr. *bathys*) harbour. The pop. variously estimated at from 30,000 to 50,000.

Anciently, S. was one of the most famous isles of the *Ægean*. At a very remote period, it was a powerful member of the Ionic Confederacy, and (according to Thucydides) its inhabitants were the first, after the Corinthians, who turned their attention to naval affairs. Their energy and resources were soon seen in the numerous colonies which they established in Thrace, Cilicia, Crete, Italy, and Sicily. But the celebrity of the island reached its acme under Polycrates (q. v.) 532 B.C., in whose time it was mistress of the archipelago. Subsequently, it passed under the power of the Persians, became free again after the battle of Mycale, stood by Athens during the Peloponnesian War, and after several vicissitudes, became a portion of the Roman province of Asia, 84 B.C. Its later history is but the melancholy record of continuous decay, nor till the rise of the modern Greeks against the Turks did it ever again acquire distinction. When the war of independence broke out none were more ardent

and devoted patriots than the Samians; and deep was their disappointment when, at the close of the sharp and brilliant struggle, European policy assigned them to their former masters. They are not, however, incorporated, so to speak, with the Turkish empire, but are semi-independent, being governed by a Fanariot Greek, who bears the title of Prince of Samos, and pays tribute to the Porte.

SAMOTHRACE, or **THRACIAN SAMOS** (Mod. Gr. *Samothraki*), an island in the north of the *Ægean*, north-east of Lemnos (*Stalimene*). It is a rugged and mountainous mass, about 8 miles long by 6 miles broad, towering to the height of 5240 feet, and forming the loftiest land in the whole Greek archipelago. The traveller on the plains of Troy can see its white summit shining out in the north-west over the intervening hills of Imbros—a proof that Homer drew from personal observation when he made Poseidon watch from his Samothracian throne the events of the war. The island has not a single good port, whence Pausanias calls it 'the most harbourless of all isles' (*impor-tissima omnium*), but there are some good anchorages. Its history is quite unimportant, and all the interest attaching to it is derived from its connection with the mysterious and gloomy worship of the Cabeiri (q. v.).

SAMOYEDS, the name of a race widely spread over the extreme north of Europe and Asia, forming one of the four families of the great Altaic stock. Originally, the S. inhabited the whole of the vast Siberian plain from the Altai to the Arctic Sea, but for many hundred years Mongol peoples have forced themselves in among them. Their chief seat at present is the region lying between the Obi and the Yenisei. They have been very little influenced by Russian civilisation or Christianity, retain in great measure their manners and customs, and live by fishing, or the rearing of reindeer. The most important researches concerning their ethnographic and linguistic relations have been made by Castrén (q. v.).

SAMPHIRE (*Critthum*), a genus of plants in the natural order *Umbellifera*; having compound umbels, and an oblong fruit, rather flattened at the back, with five winged ridges, and small villæ spread all over the seed. Common

Common Samphire (*Crithmum maritimum*).

(*C. maritimum*) is a perennial, native of Europe, growing chiefly on rocky cliffs near the sea. It is common in the south of England, but is rare in

Scotland. Its radical leaves are triternate; those of the stem have lanceolate and fleshy leaflets. The stem is about 1½ feet high, the flowers yellow. S. makes one of the best of pickles, and is also used in salads. It has a piquant, aromatic taste. It is generally gathered where it grows wild, but is sometimes very successfully cultivated in beds of sand, rich earth, and rubbish, occasionally supplied with a little salt.—*Inula Crithmoides*, a perennial plant, allied to Elecampane (q. v.), and of the natural order *Compositae*, a native of the sea-coasts of England, is used in the same way as S., and is often called GOLDEN SAMPHIRE.—The young shoots of *Salicornia herbacea* (see GLASSWORT) are also substituted for it as a pickle, and sold under the name of MARSH SAMPHIRE.

SAMSOE, a small island belonging to the kingdom of Denmark, is situated in the northern entrance to the Great Belt, between Zealand and Jutland. Area, 42 sq. m.; pop. 5875. There are no towns, and the inhabitants owe the considerable comforts they enjoy entirely to the unusual fertility of their island.

SAMSON (Heb. *Shimshon*, compare *Shemesh*, sun), the son of Manoah, of the tribe of Dan, for 20 years 'Judge' over the south-western tribes of Israel—perhaps only of Dan. It would appear, however, as if this title had only been bestowed upon him as a kind of reward for his daring and extraordinary exploits against the neighbouring Philistines, who at his birth held a great part of Palestine tributary. There is in the whole account of his deeds no sign of any superior authority vested in him. His history bears altogether more the general character of a popular tale, or saga, than that of a real historical account. His whole life is surrounded by a marvellous halo from his birth to his death. To his mother, long barren (cf. Gen. xviii. 10, 1 Sam. i. 2, &c., Luke i. 7, &c.), there appeared an angel, who promised her a son on the condition that he should become a Nazarite. He is born: his mother abstaining from all strong drink and unclean food before his birth. His hair, left to grow to its full length, in accordance with the Nazarite rules, endows him with a supernatural strength, which apparently increases with each manifestation. His first feat is his tearing a lion, when on his way to ask a Philistine woman in marriage. Returning the same road, to celebrate his wedding, he finds a swarm of bees in the lion's carcass, and forthwith propounds a riddle, which, through his wife's treachery, costs 30 Philistines their lives. We need not here recapitulate the many similar exploits composing his well-known career, which he ended by pulling down the house upon himself and his enemies the Philistines, so that 'the dead which he slew at his death were more than they which he slew in his life.'

It has been matter of most contradictory speculations, how far his existence is to be taken as a reality, or, in other words, what substratum of historical truth there may be in this supposed circle of popular legends, artistically rounded off, in the four chapters of Judges (xiii.—xvi.) which treat of him. To begin with, difficulties are raised respecting the time in which he is said to have lived. While some hold him to be a contemporary of Eli and Samuel, others see in Eli his successor; others again suppose an interregnum between him and Eli. Next comes the question how he, a Nazarite, could eat honey out of the lion's carcass—a fact, by the way, entirely ignored by Josephus. The miraculous deeds he performed have taxed the ingenuity of many commentators, and the text has been twisted and turned in all directions, to explain

'rationally' his slaying those prodigious numbers single-handed; his carrying the gates of Gaza, in one night, a distance of about 50 miles, the probable distance from Hebron to Gaza, and some have indeed assumed that he did not carry them there all at once, but piecemeal. But the principal difficulty seemed to lie in the well that sprang out of the jaw-bone, and the early Jewish interpreters (Targum, Josephus) take the word *Lehi* to be the name of a place; a notion countenanced, so far, by Gesenius, as he allows that it might have been 'derived etymologically from this myth.'

The close parallel between the deeds of S. and those of Hercules has caused some to identify the two heroes; yet whose might be the priority, is matter of contest between the different schools of biblical criticism. It is not necessary to enlarge upon this point. It is well known how Hercules slays the Nemean lion; another formidable lion at the Mount of Cithaeron; how he catches the stag of Diana and the Cretan bull; how he is kept prisoner in Egypt; how he comes to his death by the agency of a woman; not to mention the extraordinary circumstances of his birth, and the like. See HERCULES. This once popular notion, however, of seeing nothing more in S. than the Tyrian sun-god Hercules (Baal-Shemesh, 'Lord of the Sun,' Baal-Chamon, 'Lord of the Heat,' &c.), and the attempt to explain the various 'myths' accordingly, is not countenanced by most modern critics. However embellished and overlaid with legends, they say, the account in the Book of Judges may be, there is hardly any doubt as to the real existence of a man S., of extraordinary prowess, who turned his whole might and strength against the hereditary enemies of his people, whose land bordered on that of the tribe to which he belonged; who, with all his blemishes, was possessed by a noble, self-sacrificing patriotism, and never for one moment forgot the chief end and aim of his life, viz., to free his people from foreign yoke. Altogether, he is too human ever to have been an allegory or a parable, the moral of which would, indeed, hardly be perceptible, or to have, as some have conjectured, 'been intended through his whole career to be a living mockery of the Philistine Hercules.'

SAMUEL (Heb. *Shemuel*, heard by or asked from God), the last *Shofet* or Judge of Israel, the 'first of prophets,' the founder of the schools of prophets and of the monarchy in Israel. He was the son of Elkanah and Hannah, a woman of no ordinary gifts, and almost a Nazarite herself, who dedicated the long yearned-for child to the Lord even before his birth. Elkanah was of Levitic descent, living, however, not among his own tribe, but in Ephraim. S., brought up in the sanctuary at Shiloh, under the eyes of Eli, there received his first prophetic call, and from that time forth, his prophetic mission was decided. For about twenty years from the death of Eli and his sons, we hear nothing of Samuel. The first public manifestation of his assumption of the office of judge, is his convoking an assembly at Mizpeh, and routing, at the head of the people, the Philistines—his first and probably his only military achievement. His occupations generally were of a more peaceful character. Dwelling in his own native city of Ramah, where he had erected an altar, he annually went 'on circuit' to the three principal sanctuaries west of the Jordan—Bethel, Gilgal, and Mizpeh, there to instruct and judge the people, and break them from their idolatrous habits, to which they were wont to yield, in imitation of the peoples around them. For the better carrying out of this purpose, he organised special schools of teachers and prophets. These seem to have formed special colonies (Naboth, Bethel, Gilgal, Jericho), and to

have moved about in large numbers. These fraternities were destined to take an important place in the commonwealth, and to exercise the greatest possible influence upon the internal as well as the external affairs of the state, while at the same time they were the teachers of the people, expounding and developing the Mosaic law, and keeping the sacred traditions alive within the houses and hearts of Israel.

The peace S. had restored—for during his lifetime those harassing raids from the neighbouring tribes had entirely ceased—and the happy use he made of it by consolidating the religious institutions and the internal power and union of the people, must have impressed the latter with the advantage of being ruled by a firm and capable head and hand. It would have been easy enough for S. to have got himself elected king of Israel, but the establishment of a dynasty appeared to him utterly contrary to the theocratic character of the law. When, however, his two sons, Joel and Abiah, whom he had installed provisional or supplementary judges, 'turned aside after lucre, and perverted judgment,' and the complaints of the people were loud about them, S. was pressed by its representatives, who foresaw a time of terrible anarchy and lawlessness at his approaching demise, and he was obliged to yield to the general wish of installing a king to judge them 'like all the nations.' See JESUS and SAUL. The further events of S.'s life, as connected with Saul, and subsequently with David, are well known, and will be found indicated briefly under those two heads. As to his character, notwithstanding the reproaches that have been heaped upon him, we cannot but see in him one of the wisest, most sagacious, unselfish, patriotic heroes. He was, doubtless, severe and energetic in the extreme, following the path that seemed to him indicated by Jehovah as the only one leading to the common welfare. Gifted with both the spiritual and worldly supreme power over the people, at a time when they had neither political unity, nor laws, nor a *cultus*, he succeeded in rousing the public spirit, in uniting all the tribes under one banner, and in shaking off the Philistine yoke. He routed idolatry, and raised, by the institution of prophetic schools, the Mosaic religion to the highest eminence, while they at the same time formed a healthy counterpoise to priestcraft. That on finding Saul negligent to certain dicta of the law, for the protection of which alone he had been elected, he casts aside all personal love and fear, and for the sake of saving the country, and keeping its constitutions intact, chooses another more worthy head for the commonwealth, is not more than could be expected from this most zealous champion for Jehovah's commands. The people themselves gave him the most honourable testimony for his uprightness and justice, and later ages place him side by side with Moses.

S. seems, after having anointed David, to have retired from public action, and to have lived in comparative seclusion at Ramah—there is, at least, no further mention of him until his death. The time of his life and the period of his judgeship are not given. It may be presumed that he died not long before Saul. If the latter ruled for twenty years, it may well be that they governed together, as Josephus has it (*Ant.* vi. 14, 9), for eighteen years; his age, however, is not easily calculated, and the opinions about it vary between sixty and ninety years. He was buried at Ramah, and his tomb is still shewn at Nebi Samwil, although, according to Jerome, his remains were removed, under the Emperor Arcadius, to Thrace. All Israel mourned him as they had mourned none

since Moses. For his apparition at Es-Dor, &c., see NECROMANCY.

SAMUEL (SHEMUEL), BOOKS OF, originally formed one work, but were by the LXX. and Vulg. (followed by the recent Hebrew edition since Bomberg) and the Authorised Version, divided into two books, the first closing with the death of Saul. The name they bear is derived from Samuel as the principal figure in them. He not only stands at the head of the commonwealth at the period they treat of in a spiritual and worldly capacity, but also anointed Saul and David, and exercised an important influence upon their rule. Their contents beginning with the high-priesthood of Eli, the narrative concludes with the death of David, and thus three principal periods are noticed:—1. The restoration of the theocracy, of which Samuel assumes the leadership (I. i.—xii.); 2. The history of Saul's kingship till his death (I. xiii.—xxxi.); and 3. David's reign (II.).

The plan of the whole work is not, as has been stated, to represent one king as he ought not to be—viz., Saul, contrasted by a king after the heart of God, David; but simply to draw the development of the theocracy from the end of the period of Judges to the end of David's reign, its humilities and its glory under Samuel and David, whose history is, to a certain extent, told with biographical minuteness, on account of their being divinely-chosen vessels for this great work of restoration. As to the composition and unity of the books, it has been the prevailing opinion of scholars to see in them not a loose compilation from a number of stray sources, but a consecutive narrative drawn upon ancient and authentic documents. The character of the narrative itself, occasionally dwelling at large upon biographical episodes, occasionally assuming the brevity of a mere chronicle, at times repeating itself at length, is quite in accordance with ancient Semitic historiography. It has been supposed by some that the books of Samuel were composed by the same hand that wrote the books of Kings, but they belong to a much earlier period. The author appears to have lived after the separation of the kingdoms, but not before the Exile, the language being remarkably pure, and quite free from late forms and Chaldeanisms. In all probability, the author was a prophet of the time of Solomon. The Talmudical notion of Samuel's authorship has been rejected by the critics, as inconsistent with the contents and circumstances of the book. There are glosses in the book due to later hands. Of sources, we only get the 'Book of Jashar' mentioned in the work. If the author, if he did not use real annals of the period, which were only first commenced under Solomon, had, at all events, a certain number of prophetic narratives of Samuel's, Saul's, and David's lives and doings before him. As regards the occasional disagreement between S. and Chronicles, which has often been commented upon, we may either say that the latter drew upon the former, or that both—which is more probable from internal evidence—drew upon the same source, and modified the accounts according to their special tendencies. Altogether, the work before us bears the character of a truly authentic record. Of modern commentators, we mention principally Hensler, König, Kalkar, and Thénius.

SAMYDACEÆ, a natural order of exogynous plants, which are all trees or shrubs and all tropical, mostly American. The order contains about 80 known species, generally characterised by acrid agency in the bark and leaves. Some are used as medicine, to make poultices for wounds, others

doers, &c. The foliage of *Cassaria esculenta* is edible.

SANĀĀ', the principal district in Yemen or Arabia Felix, corresponding to the ancient Sāba, or Saba, the land of the Sabæans (q. v.). Its extent is very undefined, but it may be taken to include the country round the capital bearing the same name, to a distance of half a day's journey on the west, north, and east, and on the south it is bounded by the Tehāma and the districts of Lāhej and Yāffa.

While the dynasty of the Imāms existed, their sway extended over a much greater space, sometimes, indeed, over the whole of Yemen. Gradually it was encroached upon by the Sheikhs, who had been subject or tributary to them, and by the Turks. A bad system of government prepared the way for intestine strife; on the death of each sovereign, the succession was disputed, until at length no very shadow of regular government has passed away. In July 1872, S. was again occupied by the Turks, who have since overrun the greater part of Yemen.

The city of Sanāa, the capital of the Imāms of Yemen, is situated in a deep and beautiful valley, but it twenty or thirty miles in length, and six or seven in breadth, and 4000 feet above the level of the sea. The population of the city has been estimated at 40,000, and of the valley at about 100,000. This valley is bounded on the east by a high range of mountains called Jebel Nikkum, and is studded throughout its length with large villages.

The city and its suburbs are both surrounded by high walls, and, including the gardens, the circumference is about five and a half miles. The houses are of brick, well and strongly built, and most of them furnished with fountains, while the palaces of the Imāms almost approached magnificence. The few, of whom even now there are about 20,000, live a quarter to themselves, distant about half an hour's walk from the Mohammedan town: it contains many buildings, once the abode of Buence and ease, but now bearing unmistakable signs of the devastation committed by the savage and fanatical Mohammedans of the city. The city walls are of unburned brick, and mounted with cannon, but they are in a very bad condition. There are four gates, and at both east and west end a citadel containing a palace built in the Saracenic style with extensive gardens round them, and connected with a view to defence, but now utterly neglected. See **YEMEN**.

SAN ANTONIO, called also San Antonio de Bexar, a city of Texas, U.S., is built near the sources of the San Antonio River, 110 miles south-east of Austin. It is one of the oldest Spanish towns on the continent, and in the Texan revolution of 1836 was the scene of the massacre of the Alamo, when a garrison of 150 men, led by Colonel Travis, and including David Crockett, was surrounded by several thousand Mexicans, and after heroic resistance killed to the last man. It contained an arsenal, four churches, and (in 1870) 12,236 inhabitants.

SAN CASCIA'NO, a city of Central Italy, province of Florence, and ten miles south-west of a city of that name. Pop. 11,258. It is well built. The lands belonging to it produce a very strong wine, highly prized in Italy, also grain, oil, fruit, and mulberries.

SANCHUNIATHON (**SANCHUNIATHON**, **SOUNIATHON**), the supposed author of a Phœnician history of Phœnicia and Egypt, called *Phoinikika*. He is supposed to have been a native of Berytus; and the accounts which speak of him as born at Sidon or Tyre, probably take these cities in their wider

sense for Phœnicia itself. Our principal information about him is derived from Philo of Byblus, a Greek writer of the beginning of the 2d c. A.D., who translated S.'s history into his own tongue; but both the original and the translation are lost, save a few small portions of the latter, preserved by Eusebius, who uses them as arguments in a theological dispute against Porphyry. According to Philo, S. lived during the reign of Semiramis, queen of Assyria, and dedicated his book to Abibalus, king of Berytus. Athenæus, Porphyry, and Suidas, on the other hand, speak of him as of an ancient Phœnician, who lived 'before the Trojan war.' There is also a discrepancy between the various ancient writers respecting the number of books contained in the *Phoinikika*. Oræli (1826), and after him, C. Müller (1849), published the remaining fragments of S., and the hot discussion raised on their genuineness and value is far from being settled yet. Several critics went so far as to deny the fact of the existence of a S. point blank. According to some (Lobeck, &c.), it was Eusebius; according to others (Movers, &c.), Philo, who fathered his own speculations upon an ancient authority. The latter was actuated, Movers thinks, partly by the desire of proving that the whole Hellenistic worship and religion was simply a faint imitation of the Phœnician; partly by the desire of lowering the value of the Old Testament, by shewing the higher authority of the Phœnician writer; and partly, as was the fashion among the unbelieving philosophers of his age, to bring the popular creed into a bad reputation, by proclaiming his own views under the guise of an ancient sage. Yet even those who deny the authenticity of S., agree in allowing the fragments current under his name a certain intrinsic value, they being founded on real ancient myths. This, in fact, is now, with more or less modification on the part of the different investigators, Ewald, Bunsen, Renan, &c., the prevalent opinion. Ewald contends for the real existence of a S., in which he is supported by Renan. Even if there never was a S., it was not Philo who forged him. There seems no doubt that we have but a very dim and confused reproduction of what, after many modifications, misunderstandings, and corruptions, finally passed the hands of Philo and Eusebius, and was by the Church Father, as we said, quoted in a theological disputation. Yet, even assuming the person of a S., his age—and he insists upon a very remote one indeed—must be placed much lower: into the last centuries before Christ, at the earliest. He would then, it seems, have endeavoured to stem the tide of Greek superiority in all things, by collecting, grouping, and remodelling the ancient and important traditions of his own country, and thus proving to both his countrymen and to the Greeks their high importance, in comparison with the Greek productions, on the field of religion and philosophy.

The *Phoinikika* was not only a cosmogony, it would appear, but a history of his and the surrounding nations; and like similar ancient histories, it probably began with the creation of the world, and contained an account of the Jews. All the historical parts, however, are lost, and nothing remains but a fragmentary cosmogony, or rather two or three different systems of cosmogony, or, according to Movers, merely an Egyptian and Phœnician patchwork, for a brief account of which we refer the reader to the article **PHŒNICIA**. One of the chief difficulties for us consists in the Phœnician words of S., which Philo either translated too freely, or merely transcribed so faultily in Greek characters as to render them an everlasting puzzle.

Eusebius further contains a fragment of a treatise

by S., *Peri Judaism*, but it is doubtful whether this is the work of Philo of Byblus or of S.; and if it be that of the latter, whether it is a separate work, or merely a separate chapter out of his larger work. A forgery, said to contain the whole nine books of S., and to have been found by a Portuguese, Colonel Pereira, at the convent of St Maria de Merinhão, and to have been by him intrusted to a German corporal in Portuguese service, named Christoph Meyer, was published by Wagenfeld (Bremen, 1837), and translated into German (Lübeck, 1837), but was very soon consigned to disgrace and oblivion by Mörsers, K. O. Müller, and Grotefend, the last of whom had at first not only believed in its genuineness, but even written a preface to the *editio princeps*. There never was such a convent or such a colonel; but the fac-simile taken by 'Pereira' in the convent in Portugal was found to have been written on paper shewing the water-marks of an Osnabrück paper-mill.

SANCROFT, DR WILLIAM, an English archbishop, historically notable as the most distinguished dignitary among the *Nonjurors* (q. v.), was born at Freisingfield in Suffolk, January 30, 1616, educated at the grammar-school of Bury St Edmunds, and at Emanuel College, Cambridge. S. was reckoned a first-rate scholar by his contemporaries; and in 1642, S. was elected Fellow of his college, but in the following year he was deprived of his fellowship by the Puritans for refusing the famous 'Engagement,' after which he went abroad. On the restoration of Charles II., in 1660, he was appointed chaplain to Cosin, Bishop of Durham; and after several preferments, was in 1668 made Archdeacon of Canterbury, and in 1677 was raised, against his inclination, to the first dignity in the church—the archbishopric of Canterbury. The manner in which S. discharged his ecclesiastical duties deserves the highest commendation. He attended King Charles II. on his death-bed, and is said to have spoken very freely to the once 'merry monarch' on the nature of his past life. In 1688, along with several of his brother-bishops, he was committed to the Tower by King James II., for sending him a petition in which they explained why they could not conscientiously order his declaration in favour of liberty of conscience to be read in the churches; but in the events which immediately preceded and accompanied the great Revolution, he played a somewhat ambiguous and perplexing part. At first he refused when James asked him to sign a declaration expressing abhorrence of the Prince of Orange's invasion. Later (December 1683), he even went the length of concurring in an address to William, yet he seems from this point to have drawn back, and to have fallen under the dominion of his theory of the Divine Right of Kings. He was not present at the convention of the lords spiritual and temporal to meet the new monarch, and after the settlement, he refused, along with seven other bishops, to take the oath of allegiance to the government, in consequence of which he was suspended by act of parliament, August 1, 1689, but his actual departure from Lambeth did not take place till June 23, 1691. He then retired to his native village, where he died, November 24, 1693. See Macaulay's *History of England*, vols. ii. iii. and iv.

SANCTIFICATION, in distinction from justification, in the nomenclature of Protestant theology, is the process by which the Holy Spirit renews man in the divine image, destroying within him the power of evil, and quickening, educating, and strengthening in him the life of goodness and holiness. Whereas justification is considered as a judicial act on the part of God's free grace,

liberating the sinner from condemnation, absolving and pardoning him once for all, sanctification is reckoned a work or process, advancing in various stages of weakness or strength, and only complete in the future life of the believer, when removed beyond the influences of sin that now surround him. In Roman Catholic theology, this distinction between the initiative of the divine life in E.A. (justification) and its progressive development (sanctification), is not maintained, at least in the same precise and logical manner that it has been advocated by Protestants. By the latter, the distinction has been held of first-rate importance in their theological systems, and no less so in their practical conception of the Christian life.

SANCTUARY, a consecrated place which gave protection to a criminal taking refuge there; or a privilege of taking refuge in such a consecrated place. Among the Jews, there were cities of refuge to which the slayer might flee who killed a man unawares, and something analogous to a sanctuary may also be traced in pagan communities. In the ancient Greek states the temples, or at least some of them, afforded protection to criminals, as it was unlawful to drag from them, although the food which was being supplied might be intercepted. As early as the 7th c., the protection of sanctuaries was afforded to persons fleeing to a church or certain boundaries surrounding it. The canon law of the more ancient ecclesiastical law recognises the protection to criminals as continuing for a limited period, sufficient to admit of a composition for offence; or, at all events, to give time for the heat of resentment to pass, before the injured party could seek redress. In several English churches there was a stone seat beside the altar where the fleeing to the peace of the church were held to be guarded by all its sanctity. One of these remains at Beverley, and another at Hexham. To violate the protection of this seat, or of the seat of relics, was an offence too grave to be compensated by a pecuniary penalty. Connected, in England, with the privilege of sanctuary was the practice of *abjuration of the realm*. By the ancient common law, if a person guilty of felony took the benefit of sanctuary, he might, within forty days afterwards, go clothed in sackcloth before the coroner, confess his guilt, and take an oath to quit the realm, and not return without the king's licence. On doing so, and taking the oath, he became attainted of the felony, but had forty days allowed him to prepare for his departure, and a port assigned him for embarkation, to which he must immediately repair with a cross in his hand, and embark with all convenient speed. If he failed to depart, or afterwards returned without licence, he was condemned to hang, unless he happened to be a clerk, in which case he was allowed the *benefit of clergy*.

By the ancient canons of the Scottish church, excommunication was incurred by the offence of taking of thieves out of the protection of the church. Some churches, however, by their superior sanctity, were held practically to afford a surer asylum than others, and it was not uncommon for the Scottish kings, with the view of strengthening the hands of the church, to give a formal sanction to particular ecclesiastical asylums. One of the most celebrated sanctuaries in Scotland was the church of Wedale, now called Stow, where was an image of the Virgin believed to be brought by King Arthur from Jerusalem. David I. granted the 'King's Peace,' in addition to the protection of the church, to all fugitives from peril of life or limb, who betook themselves to the church of Lismore. The Scotch law of sanctuary or *gryth* was guarded from affording too easy an immunity.

A very remarkable right of sanctuary existed in Scotland under the name of the *privilege of Clan Macduff*, which was alleged to have been granted by Malcolm Canmore on recovering the throne of his ancestors. Any person related within the ninth degree to the chief of Clan Macduff, who should have committed homicide without premeditation, was entitled, on fleeing to Macduff's Cross in Fife, to have his punishment remitted for a fine, or at least to be repledged from any other jurisdiction by the Earl of Fife. There is evidence of this privilege having saved Hugh de Arbutnot and his accomplices from being proceeded against for the murder of John de Melvil of Glenberrie in 1421.

While the institution of sanctuary often enabled criminals to bid defiance to the civil power, it no doubt was not unfrequently a protection to the innocent, who thus escaped oppression or private retribution pursuing them under the name of law. In the unsettled times it seems, on the whole, to have operated beneficially by throwing the control of society into the hands of the clergy, who were more tempted than any other class to misuse that power. But as the civil power and authority of the church were strengthened, the right of sanctuary came useless and mischievous; the civil power devoured to narrow the privilege as far as possible, while the church sought hard to preserve it.

The English Reformation, though it greatly restricted, did not abolish the right of sanctuary. It was not till 1534 that persons accused of treason were debarred the privilege, and the right of sanctuary for crime was finally abolished by 21 & 22 L. c. 28. Various precincts, however, in and about London, known as sanctuaries, continued to afford shelter to debtors, all which were done away with in 1697, by Act 8 and 9 Will. IV. c. 36.

In Scotland there still exists a sanctuary for debtors in the Abbey and Palace of Holyrood, with precincts, including the hill of Arthur Seat and Queen's Park. The sanctuary is placed under the control of a bailie appointed by the Duke of Hamilton as heritable keeper of Holyroodhouse. When a debtor retires to the sanctuary, he has a 24 hours' protection against personal diligence; but in order to extend the privilege longer, he must be valued in the books of the abbey. The sanctuary affords no protection to a criminal, a fraudulent debtor, or a crown debtor; nor is it available for protection from personal execution for debts contracted within its precincts, for which the debtor may be imprisoned in the abbey jail.

SAND, GEORGES. See DUDEVANT, MADAME.

SANDALS, a covering for the feet, consisting of a sole so attached as to leave the upper part of the foot bare. See SHOES.

SANDAL-WOOD (a name corrupted from *Santalum*), the wood of several species of the genus *Santalum*, of the natural order *Santalaceæ* (q. v.), natives of the East Indies and tropical islands of the Pacific Ocean. S.-W. is compact and fine grained, very suitable for making work-boxes and all ornamental articles, and is remarkable for its fragrance, which, however, is fatal to insects, so that cabinets of S.-W. are extremely suitable for the preservation of specimens in natural history; but it is such too expensive for general use. The odour due to an essential oil, heavier than water. The tree S.-W., the most common kind, is the produce of a small tree (*Santalum album*), a native of the south of India and the Indian Archipelago, much branched, resembling myrtle in foliage and privet in its flowers. The trunk is from more than a foot in diameter. **YELLOW S.-**

W. is probably produced by another species, perhaps *S. Freycinetianum* of the Indian Archipelago and Sandwich Islands, and from these regions the Chinese import it, chiefly for the purpose of burning it both in their temples and in their houses. They reduce it to sawdust, and mix it with paste before burning. Dr Seemann has, however, recently found another and previously-unknown species of *Santalum* (*S. Yasi*) to yield the much-valued S.-W. of the Fiji Islands, where the tree has been almost extirpated in consequence of the demand for its wood in commerce.

RED S.-W., or SANDERS, is the produce of a very different tree, *Pterocarpus santalinus*, of the natural order *Leguminosæ*, suborder *Papilionaceæ*, a native of the tropical parts of Asia, particularly of the mountains of the south of India and of Ceylon. The tree is about sixty feet high, with pinnated leaves, having generally three leaflets, and axillary racemes of flowers. The heart-wood is dark red, with black veins, and so heavy as to sink in water. It is used as a dye-stuff, and also by apothecaries to colour certain preparations. The Arabs use it as an astringent, and it is the basis of some of our tooth-powders.—A deep red dye is also yielded by the chips of *Adenanthera pavonina*, a tree allied to the *Acacias* (q. v.), a native of the East Indies. The wood of this tree is sometimes called **RED SANDAL-WOOD**.

SANDALWOOD ISLAND, called by the natives Tjindana, Sumba and Tanah Tjumba, lies in the Indian Ocean, between 9° 18'—10° 20' S. lat. and 118° 58'—120° 43' E. long., has an area of 4966 sq. m., and a pop. of 1,000,000. The coast is steep and rocky, so that, except at the west, south, and east corners, ships can approach quite near. The produce consists chiefly in dye-woods, ebony, timber, cotton, rice, pepper, cocoa, maize, coffee, sugar, wild cinnamon, cocoa-nuts, and various fruits. Little sandalwood is exported, though abounding in the forests, the natives refusing to cut the trees, which they believe to be the dwellings of their ancestors' souls. Exports are: horses, timber, cotton, pepper, wax, tortoise-shell, tow made from bark, maize, and edible nests. The cliffs swarm with the *Collocalia esculenta*, and collecting the nests is a leading occupation of the men. The Sandalwood islanders belong to the Malay race, are well made, wiry, and of a brownish complexion. The most trifling causes lead them to commit suicide, a vice of rare occurrence in other parts of the archipelago.

The S. I. is nominally subject to the Netherlands, but the rajahs and regents are almost independent of foreign influence. The principal havens are at Nangamessi on the north, and Tida about the middle of the south coast, good anchorage being found in many other parts. Notwithstanding the repressive measures taken by the Netherlands government, and the destruction, in 1860, of ten vessels engaged in the slave-trade, it is still extensively carried on by the Sandalwood islanders.

SANDARACH, or SANDARACH RESIN, is a friable, dry, almost transparent, tasteless, yellowish-white resin, which is imported from the north of Africa. It is completely soluble in oil of turpentine, but not completely soluble in alcohol. When heated, or sprinkled on burning coals, it emits an agreeable balsamic smell. It exudes from the bark of the S. tree (*Callitris quadrivalvis*), a native of the north of Africa, of the natural order *Coniferae*.—The quantity of S. used is not great; it is employed mostly for the same purposes as Mastic (q. v.). The finely-powdered resin is rubbed, as *Pounce*, on the erasures of writing-paper, after which they may be written upon again without the ink spreading.—

SANDWICH—SANDWICH ISLANDS.

halls, hotels, schools, &c. There are several newspapers, manufactures of lumber and bent woodwork for carriages, &c., with extensive fisheries. Pop. in 1860, 8408; in 1870, 13,000.

SANDWICH (i.e., village on the sands), a Cinque Port, market-town, and municipal borough of Kent, on the right bank of the Stour, 98 miles east-south-east of London by the South-Eastern Railway. Within the last 800 years the sea has here considerably receded, for S., which is now two miles from the shore, is described, at the commencement of the 11th c., as the most famous of all the English harbours—*omnium Anglorum portuum famosissimus*. The town is rectangular, and was surrounded by walls, along which a broad path now leads. The streets are confined; and the houses, which seem crushed together, and the architecture of which recalls the times of the Plantagenets, are peculiarly and strikingly antique in appearance. The church of St Clement's, with a low Norman tower, is probably the most interesting edifice. Small vessels importing timber, iron, and coal, and exporting corn, flour, malt, seeds, and hops, come up to the town. Tanning, shipbuilding, and seed-crushing are carried on. In conjunction with Deal and Walmer, the town sends two members to parliament. Pop. (1871) of municipal borough, 3080; of the parliamentary borough of S. and Deal, 14,885.

S., the most ancient of the Cinque Ports, probably occupies the site of the Roman *Rutupia*, and many interesting antiquities have been found in the vicinity. In the reign of Edward IV. its customs yielded £17,000 yearly, and 95 ships and 1500 sailors belonged to it.

SANDWICH, a favourite viand which is said to have been named after the Earl of Sandwich. It consists of two thin slices of bread, plain or buttered, with some savoury food placed between. Formerly, it was applied exclusively to bread with thin slices of ham, tongue, or beef, but of late a great variety of materials have been used; one celebrated Glasgow confectioner, Mr Lang, has the credit of making one hundred different kinds of sandwiches.

SANDWICH ISLANDS, forming the kingdom of Hawaii, are a rich, beautiful, and interesting chain, eight in number, exclusive of one or two small islets. The chain runs from south-east to north-west, and lies in the middle of the Pacific Ocean, in lat. 19°–22° N., long. 155°–160° W. Area, 7400 sq. m.; pop. (1872) 56,897, of whom 2539 were Europeans. The names, with the areas of the respective islands, are: Hawaii (formerly Owhyhee), 4850 sq. m.; Maui, 750; Oahu, 700; Kauai, 780; Molokai, 170; Lanai, 170; Niihau, about 110; and Kahoolau, about 40 sq. miles.

Surface, &c.—Situated near the middle of the Pacific Ocean, about half the distance from San Francisco in North America that they are from Melbourne in Australia, and Canton in China, the S. I. form an oasis in the middle of a wide ocean waste, and offer convenient stations for the refreshment and repair of the merchantmen and whalers that traverse the Pacific. They are of volcanic origin, and contain the largest volcanoes, both active and quiescent, in the world. The most prominent physical features of the group are the two lofty mountain peaks of Hawaii, Mauna Kea and Mauna Loa, each of which is 14,000 feet in height, or within 1800 feet of the loftiest of the Alps. Besides these two chief peaks, which stand apart from each other, and one of which is covered with perpetual snow, the island is traversed by other mountains, which give it a rugged and picturesque outline, and in some cases front the sea in bold, perpendicular precipices, from 1000 to 3000 feet in

height. In general, the islands are lofty—the small islet of Lohia is 1000 feet high, and the upland regions of Kauai are, on an average, 4000 feet above sea-level. Within the coral reefs, which, in some places, and more rarely in double ridges, skirt portions of the coasts, sandy shores, leading up to rich pasture-lands, and occasionally to productive valleys, are frequently seen. Everywhere, however, the configuration of the surface betrays the volcanic origin of the islands. Extinct and partially active volcanoes occur in most of the islands. Kilauea on the Mauna Loa mountain in Hawaii, the largest active volcano in the world, has an oval-shaped crater 9 miles in circumference, and is 6000 feet above sea-level. In the centre of this immense caldron is a red sea of lava, always in a state of fusion. At intervals, the lava is thrown to a great height, and rolls in rivers down the mountain sides. From 1856 to 1859, this volcano was in an incessant state of eruption, forming at night a sublime spectacle, and occasionally casting burning streams, by one of which a fishing-village was destroyed, a bay on the island filled up, and a promontory formed in its place. On Maui, the crater of Mauna Haleakala (House of the Sun), by far the largest known, is from 25 to 30 miles in circumference, from 2000 to 3000 feet deep, and stands 10,000 feet above sea-level. Within this huge pit, about 16 basins of old volcanoes, whose ridges formed concentric circles, have been counted. Good harbours are few. The chief is that of Honolulu (q. v.), in Oahu, with 22½ feet of water in its shallowest parts. On the same island, Ewa, an immense basin, with 12 feet water at low tide. During the prevalence of the trade-wind, which blows south-west for about nine months in the year, the south shores of the islands afford safe anchorage almost everywhere.

Climate, Soil, Rivers, &c.—Though situated within the tropics, the S. I. boast a climate that is temperate rather than tropical. In the native language, there is no word to express the idea of *weather*, and this fact may be considered as evidence that extremes of heat or cold do not occur. Honolulu, the extremes of temperature in the island during 12 years were 90° and 53°, and the diurnal range is 12°. Rains brought by the north-east trade-wind are frequent on the mountains; but on the leeward side of the islands, little rain falls, and the sun is rarely obscured by clouds. The constituent parts of which are mainly composed of decomposed lava and sand, is generally thin and sterile. This, however, is not universally the case. At the bases of the mountains and in the valleys, where abrasion, disintegration, and the accumulation of vegetable mould, have gone on for ages, there are extensive tracts as fertile as they are beautiful. The islands produce fine pasturage in abundance, and large herds are bred and fattened, to supply meat to the whalers and merchant-ships. On the Waialeale Plains, in Hawaii alone, 30,000 sheep of the improved breed were grazing in 1864. The upland slopes of the mountains are clothed with dense forests; and, as one descends, are grassy plains and sugar and coffee plantations. Basalt, compact lava, coral-rock, and sandstone, are used for building purposes. No iron occurs. Several of the islands, especially Hawaii and Kauai, are well supplied with rivers, which, from the size and conformation of the group, are necessarily small, but afford great facilities for irrigation. Vast numbers of semi-wild horses roam the mountains, and while they consume the pasturage, and break down the fences, are of little use. The indigenous fauna is small, and consists mainly of swine, rats, a bat that flies by day, birds of beautiful plumage, but for the most part songless. An

the indigenous trees and plants are the sugar-cane, banana, plantain, cocoa-nut, candle-nut, various palms, the taro, a succulent root which formed the staple of the food of the natives, and is still generally used; the cloth-plant; and the *ti*, the roots of which were baked and eaten, while the leaves were used for thatching huts. Cattle and other useful foreign animals and plants were introduced by Vancouver and other navigators. In 1860, there were 30,000 mules and semi-wild horses in the kingdom.

Commerce, Products, &c.—The commerce of this young kingdom is still in its infancy, but is gradually on the increase. Until recently, the most important branch of it was maintained by vessels engaged in the whale-fisheries of the North Pacific. This branch of commerce has greatly declined within recent years. In 1872, 47 whaling-vessels, hewing a decrease of 71 as compared with the number in 1870, entered the ports. Trusting no longer to the whaling business, the producers and merchants of the S. I. have found out other outlets for their goods, and, without doubt, the trade of the islands will in the future be almost wholly confined to the coasts that bound the Pacific. The islands are within 16 days (by sailing-vessels) of San Francisco, 27 days from Vancouver's Island, 8 days from Kanagawa in Japan, and 67 days from Hong-kong. Sugar, coffee, and rice have been proved to produce well, and all these find ready markets at hand in California, British Columbia, and Vancouver's Island, which, together, can consume more than the S. I. can supply. Of sugar, the 3,000,000 lbs. produced in 1862 were raised to nearly 17,000,000 in 1872, and from a number of new plantations recently organised, an amount of produce may be expected to continue increasing. The exports, consisting mostly of sugar, coffee, rice, pulu (q. v.), hides, and corn, amounted in 1872 to 1,607,000 dollars; the imports, mostly manufactured goods, amounted in the same year to 1,595,000 dollars.

History, Constitution, and Finances.—Of the origin and character of the inhabitants of this kingdom, and its interesting internal history, or of the much-investigated question as to whether the native race will flourish along with or wither before the Aryan race, it is not within our limits to speak. We can only notice a few of the leading events which have occurred in these islands since their shores were first visited by what the natives called the 'floating islands' of the civilised nations. Although one member of the group as seen by Gaetano in 1542, the islands cannot be said to have been discovered till Cook visited them in 1778. The great navigator treated the simple and confiding natives with a cruelty and hypocrisy which consort ill with his fame, and which were the direct causes of the brawl in which he met the death he had provoked in Kealahakua Bay, Hawaii, 1779. In early times, each island had its king; but under Kamehameha I., a man of shrewdness, and of great bravery and resource, the islands were formed into one kingdom. This king, writing to George III., August 6, 1810, desired formally to acknowledge the king of England as his sovereign, and to place the islands under British protection—an offer which was accepted. After inaugurating an era of advancement, this king died in 1819, and was succeeded by Liholiho, who adopted, on his accession, the name of Kamehameha II., and in whose reign idolatry was abolished simultaneously throughout all the islands. The first Christians who visited the S. I. were Cook and his followers, of whom the simple natives retained no favourable impression. Vancouver, who arrived with Cook in 1778 and returned in 1792, and again in 1794,

made sincere attempts to enlighten the natives, and the king and his chiefs requested Vancouver to send out religious teachers to them from England; but the first missionaries that visited the islands came from America in 1820. On their arrival, the missionaries witnessed the singular phenomenon of a nation without a religion. The instructions of Vancouver had not been forgotten, and no doubt enabled the idol-worshipping islanders to see more readily the absurdities of their system. But the spontaneous movement of 1819—1820, when the whole nation rose up to destroy idols, temples, and the furniture of idolatry, 'was no triumph of Christianity—for Christianity had not yet claimed or even approached the Hawaiian Islands.' The nation had voluntarily cast off the religion of their ancestors, and had not yet adopted—were not even acquainted with—any other system. The American missionaries who arrived in 1820 were well received, and the work of instruction was at once begun. Besides instructing them in Christianity, in less than 40 years they taught the whole Hawaiian people to read and write, to cipher and to sew.

Kamehameha II. and his queen visited England, and after a short residence in this country, both died in London, July 1824. Prior to the year 1838, the government was a despotism; but in 1840, the king, Kamehameha III., granted a constitution, consisting of king, assembly of nobles, and representative council. This constitution, based on that of Great Britain, has in more recent times been much matured and improved. In 1843, the independence of the Hawaiian kingdom was formally declared by the French and English governments. Kamehameha IV. acceded to the throne in 1854, and after a brief but useful reign, died in November 1863, and was succeeded by his brother, Kamehameha V. On his death, Lunalilo was elected in January 1873. He, too, died after a reign of 13 months, and the choice then fell on Kalakaua. The revenue for the years 1870—1872 was 964,956 dollars; the expenditure, 969,784 dollars.

SANDWORT. See ARENARIA.

SAN FELIPE DE ACONCA'GUA, a town of Chili, capital of the dep. of Aconcagua, 60 miles east-north-east of Valparaiso. It is regularly built, and has a handsome appearance. In the vicinity are copper-mines. Pop. stated at from 12,000 to 13,000.

SAN FELIPE DE JATIVA. See JATIVA.

SAN FRANCISCO, the principal seaport on the western coasts of North America, and the chief city of California, U. S., stands on the west shore of San Francisco Bay, 6 miles south of the Golden Gate, the outlet leading west, and connecting the bay with the Pacific Ocean. Lat. 37° 46' N., long. 122° 23' W. It has a fine deep harbour, well-built streets, handsome shops, gas and water works, and elegant public buildings, among which are the custom-house, mint, marine hospital, city hospital, theatres, orphan asylums, a convent, &c. There are about 50 churches (including some Buddhist temples), 9 daily and 38 other newspapers, numerous schools and charitable institutions, and several fire insurance companies. Of the population attracted by the discovery of gold to S. F., a great number are Irish, German, British, French, and Chinese. There are newspapers in English, French, German, Spanish, and Italian. The Chinese have a church, Roman Catholic, with a Chinese priest educated at Rome; and a school. Among the manufacturing establishments are flour-mills, saw-mills, woollen factories, and iron-foundries. In 1869—1870, 73 vessels from foreign ports, with an aggregate burden of 172,571 tons, entered the harbour, and 69 of 162,600 tons cleared.

In 1869, the receipts of precious metals amounted to £9,857,295; but this sum does not nearly represent all the receipts, as much treasure comes by private hands, and passes through no channel by means of which the amounts can be noted by the authorities. The treasure exported amounted to £7,457,423. The other exports were chiefly wheat, barley, wool, quicksilver, hides, furs, flour, gunpowder, and copper ore. The imports included sugar, coal from Great Britain and Sydney, rice, coffee, tea, wines and spirits, iron, cotton, silk, and various manufactured goods. There is a large timber-trade with Oregon and British Columbia, and six ocean steamers make regular trips to Panama. The Union Pacific Railroad, completed in 1870, makes S. F. an important point as the commercial highway between Europe and the Eastern United States and Asia. In 1776, the mission of St Francis was commenced here by two Spanish monks. In 1825, the mission had under its care 1800 Indians, and possessed 76,000 cattle and 79,000 sheep. In 1834, the property of the mission was secularised, and it rapidly decayed. In 1846, it was taken by the United States, and in 1847 had a population of 450. The discovery of gold in 1848 caused it to be at first nearly deserted; but soon commenced a rapid growth, which, in spite of several destructive fires, has continued to increase. Pop. in 1860, 55,626; in 1870, 149,473.

SANGAREE, a West Indian beverage, consisting of Madeira wine, syrup, water, and nutmeg.

SANGERHAUSEN, a town of Prussian Saxony, in the government of Merseburg, and 33 miles west-north-west of the city of that name. It contains two castles; carries on weaving, tanning, shoe-making, and copper-smelting, and manufactures saltpetre. Pop. (1872) 8852.

SANGIR ISLANDS lie to the north of Celebes, in 2°–4° N. lat., are upwards of 50 in number, of various sizes, and nearly all inhabited. Pop. 30,000. The three largest islands, Great S., Sijauw, and Tagolandang, with those which surround each, form as it were separate groups. In the S. I. are many mountains, which, except the volcanoes, are clothed to their summits with a rich vegetation. Great S. has an area of 273 sq. m., and is divided into four kingdoms. The usual anchorage is on the west side, in 3° 28' N. lat., and 125° 44' E. long. Pop. 13,000. In the north-west is a volcano, called Abu, or the 'Ash Mountain,' which has frequently caused great devastation. In March 1856, the streams of lava and boiling water carried away the rich plantations, and 2806 lives were lost.

Sijauw lies in 2° 43' N. lat., and 125° 28' E. long., is also mountainous; a volcano, on the north-east coast, being 6200 feet high. Pop. 3000. The chief town is Uluw.

Tagolandang, in 2° 20' N. lat., and 125° 30' E. long., is populous, and the centre of the missionary work which has been carried on successfully in the S. Islands. A small ship belongs to the station, in which to visit the scattered converts and schools.

In all the islands, the areng (*Saguerus* or *Borassus gomutus*), the sago, cocoa-nut, and the finest sorts of timber-trees abound. Maize, rice, katjang (a species of bean), tobacco, cocon, and the sugar-cane are cultivated.

The Sangirese belong to the Malay race, are well made and brave, but cunning, lazy, and dirty in their habits. This, and scarcity of pure drinking-water, make them liable to a loathsome skin disease. There are four rajahs in Great S., one in

Tagolandang, and one in Sijauw. The government is monarchical, somewhat limited by a council.

Towards the end of the 15th c., the Sangirese became Mohammedan; a century later, under the Portuguese, they were brought over to Christianity. These islands, forming now a Netherlands dependency, have several Dutch missionaries, and 21 churches, which are also used as schools. Government supports 8 teachers, the villages 16.

SANG-KOI. See **TONQUIN**.

SANGRAAL. See **GRAAL**.

SANGUINARIA, a genus of plants of the natural order *Papaveraceæ*, having 6–12 petals; stigmas, an oblong swollen capsule with two deciduous valves, and a persistent, many-seeded frame. *S. Canadensis*, the BLOOD-ROOT or PUCCOON of North America, has a fleshy root-stalk abounding in a red juice, which abounds also in the leaf-stalks; and solitary radical leaves, which are roundish, deeply heart-shaped, and with about seven toothed angles. The flowers are solitary and spring from the root on short stalks. The whole plant is acrid and narcotic, emetic and purgative in large doses; and in small doses stimulant, diaphoretic, and expectorant. It is much used as a medicine in the United States.—It is supposed to owe its properties to a peculiar alkaloid called *Sanguinarine*, which is obtained from it as a white pearly substance. The large white flowers appear early in spring, and are a frequent ornament of flower-borders.

SANGUINE, or **MURREY**, one of the tinctures of less frequent occurrence in Heraldry, denoting blood colour, and represented in engraving by lines crossing each other saltireways.

SANGUISORBA'CEÆ, or **SANGUISORBEÆ**, according to some botanists a natural order of plants, but more generally regarded as a sub-order of *Roseæ* (q. v.). As a sub-order, its distinctive characters are apetalous flowers—the tube of the calyx thickened, indurated, and lined with a disc, generally few stamens, and a solitary carpel, which ripens into a nut enclosed in the calycine tube. About 150 species are known, all of which are herbaceous or half shrubby, some of them spiny.—The leaves of *Acaena sanguisorba*, a native of Van Diemen's Land, are said to be an excellent substitute for tea. Of British species, Burnet (q. v.) and Lady's Mantle (q. v.) are among the best known.

SANHEDRIM (Gr. *Synedrion*), the supreme national tribunal of the Jews, established at the time of the Maccabees, probably under John Hyrcan. It consisted of 71 members, and was presided over by the Nasi (Prince), at whose side stood the Ab-Beth-Din (Father of the Tribunal). Its members belonged to the different classes of society: there were priests (*Archieries*); elders, that is, heads of families, men of age and experience (*Presbyters*); scribes, or doctors of the law (*Grammateis*); and others, exalted by eminent learning—the sole condition for admission into this assembly. The presidentship was conferred on the high-priest in preference, if he happened to possess the requisite qualities of eminence; otherwise, 'he who excels all others in wisdom,' was appointed, irrespective of his station. The limits of its jurisdiction are not known with certainty; but there is no doubt that the supreme decision over life and death, the ordeal of a suspected wife, and the like criminal matters, were exclusively in its hands. Besides this, however, the regulation of the sacred times and seasons, and many matters connected with the cultus in general, except the sacerdotal part, which was regulated by a special court of priests, were vested in it. It fixed the beginnings of the a. v.

moons; intercalated the years, when necessary; watched over the purity of the priestly families, by carefully examining the pedigrees of those priests born out of Palestine, so that none born from a suspicious or ill-famed mother should be admitted to the sacred service; and the like. By degrees, the whole internal administration of the commonwealth was vested in this body, and it became necessary to establish minor courts, similarly composed, all over the country, and Jerusalem itself. Thus, we hear of two inferior tribunals at Jerusalem, each consisting of 23 men, and others consisting of three men only. These courts of 23 men (lesser Synedria), however, as well as those of the three men, about one of which Josephus is silent, probably represent only smaller or larger committees chosen from the general body. Excluded from the office of judges were those born in adultery; men born of non-Israelitish parents; gamblers; usurers; those who sold fruit grown in the Sabbatical year; and, in single cases, near relatives. All these were also not admitted as witnesses. Two scribes were always present, one registering the condemnatory, the other the exculpatory votes. The mode of procedure was exceedingly complicated; and such was the caution of the court, especially in matters of life and death, that capital punishment was pronounced in the rarest instances only. The Nasi had the supreme direction of the court, and convoked it when necessary. He sat at the head, and to his right hand was the seat of the Ab-Beth-Din; the rest of the 71 took their places according to their dignity, in front of them, in form of a semicircle, so that they could be seen by both the chief officers. The lictors, or 'sheriffs,' were always present at the session. The court met on extraordinary occasions at the house of the high-priest; its general place of assembly, however, was a certain hall (*Lishkat ha-gazit*), probably situated at the south-east corner of one of the courts of the temple. With exception of Sabbath and feast days, it met daily. The official troubles forced the Sanhedrim (70 B.C.) to change its abode, which was first transferred to certain bazaars (*Hannoth*) at the foot of the temple mount. After the destruction of the temple and Jerusalem, it finally established itself, after many other emigrations, in Babylon.

We cannot here enter into that most difficult question as to the origin and development of the Sanhedrim, and how far it was intended primarily to be a faithful reproduction of the Mosaic assembly of the 70 (Moses himself making 71), supposed to have been re-established by Ezra after the Exile; or more than we can examine in this place into the widely different opinions respecting the jurisdiction and competence of the Sanhedrim at the time of Christ and the apostles; how far, in fact, it may be said to have existed at all—save for a few matters of smallest importance—curtailed and circumscribed as it was by the Romans, who seem to have recognised only the 'high-priest;' and that collateral but most vital question, whether it was the Sanhedrim at all from whom emanated those well-known acts recorded in the New Testament. There can be no question as to its utter incompetence to punish Christ for a 'crimen læsæ majestatis,' i. e., or high treason against the Roman emperor. No less difficult is the explanation of many of the proceedings against the apostles ascribed to this body. The suggestion, that the word Synedria, as used in the New Testament, stands only for an arbitrarily convoked 'lynch-tribunal,' deserves more consideration than it has hitherto received.

SANHITĀ is the name of that portion of the Vedas which contains the Mantras or hymns. See *VEDA*.

SANITARY SCIENCE. See SUPPLEMENT.

SA'NJAK, a Turkish word signifying 'a standard,' is employed to denote a subdivision of an *eyalet* (q. v.), because the ruler of such a subdivision, called *sanjak-beg*, is entitled to carry in war a standard of one horse-tail. The sanjak is frequently called a *liwa*, and its ruler a *mirmiran*.

SANJAK-SHERIF. See FLAG OF THE PROPHET.

SAN JOAQUIN, a river of California, U.S., rises in the Sierra Nevada, and runs first south-west to its junction with the outlet of Lake Tulare, thence north-west to its junction with the Sacramento River, 50 miles from the Bay of San Francisco. It receives numerous branches from both the coast range of mountains and the Sierra Nevada. Entire length 350 miles, for only a small portion of which it is navigable for large vessels.

SAN JOSE', or SAN JOSE DEL INTERIOR, the capital of Costa Rica, Central America, on the River Carthago, and 15 miles west-north-west of the remains of the town of that name, which was formerly the capital of the country. It stands on a table-land 4500 feet above sea-level, contains a number of important institutions (including a university), and carries on an active trade. Its port is Punta Arenas, on the Gulf of Nicoya, 60 miles west. In 1871, 127 vessels, of 174,724 tons, entered, and 127 vessels, of 172,737 tons, cleared Punta Arenas. Pop. of San José, 25,000.

SAN JUAN DE PORTO RICO. See PUERTO RICO.

S'ANKARA, or S'ANKARĀCHĀRYA, i. e., the *āchārya*, or spiritual teacher, S'ankara, is the name of one of the most renowned theologians of India. His date, as is the case with most celebrities of that country, is unknown. Tradition places him about 200 B.C., but H. H. Wilson assigns him, with more probability, to the 8th or 9th c. after Christ. With regard to his place of birth and to his caste, most accounts agree in making him a native of Kerala or Malabar, and a member of the caste of the Nambūri Brahmins. In Malabar, he is said to have divided the four original castes into seventy-two, or eighteen subdivisions each. All accounts represent him as having led an erratic life, and engaged in successful controversies with other sects. In the course of his career, he founded the sects of the *Daśanāmi-Dandīns* (see S'ARVAS). Towards the close of his life, he repaired to Cashmere; and finally to Kedarnāth, in the Himalaya, where he died at the early age of 32. His principal works, which are of considerable merit, and exercised a great influence on the religious history of India, are his commentary on the *Vedānta* (q. v.) Sūtras, and his commentaries on the *Bhaga vadgītā* and the principal *Upanishads* (q. v.). His learning and personal eminence were so great, that he was looked upon as an incarnation of the god Śiva, and was fabled to have worked several astounding miracles. One of these was his animating the dead body of a King Amaru, in order to become temporarily the husband of the latter's widow, so as to be able to argue with the wife of a Brahman Mandana upon the topic of sensual enjoyments—the only topic on which he had remained ignorant, as he had always led the life of a Brahmachārin, or bachelor student. A number of works are current in the south of India relating to his life; among these, the *S'ankara-dig-vijaya*, or the conquest of the world by S., composed by Anandagiri, one of his disciples, is the most important.—See H. H. Wilson, *A Sketch of the Religious Sects of the Hindus*; works, vol. i. (edited by Dr R.

Rost, 1862), pp. 197, ff.; and Cavell Venkata Ramaswami, *Biographical Sketches of Deccan Poets* (Bombay, 1847).

SĀṆKHYA (from the Sanscrit *sankhya*, synthetic reasoning) is the name of one of the three great systems of orthodox Hindu philosophy. See SANSKRIT LITERATURE. It consists of two divisions—the Sāṅkhya, properly so called, and the YOGA (q. v.); and like the other systems (see Mīmāṃsā and NĀYAYA), it professes to teach the means by which eternal beatitude, or the complete and perpetual exemption from every sort of ill, may be attained. This means is the discriminative acquaintance with *tathoa*, or the true principles of all existence, and such principles are, according to the Sāṅkhya system, the following twenty-five: (1), *Prakṛiti* or *Pradhāna*, substance or nature; it is the universal and material cause; eternal, undiscrete, inferable from its effects; productive, but unproduced. Its first production is (2) *Mahat* (lit. the great), or *Buddhi* (lit. intellect), or the intellectual principle, which appertains to individual beings. From it devolves (3) *Ahankāra* (lit. the assertion of 'I'), the function of which consists in referring the objects of the world to one's-self. It produces (4–8) five *tanmātrā*, or subtle elements, which themselves are productive of the five gross elements (see 20–24). *Ahankāra* further produces (9–13) five instruments of sensation—viz., the eye, the ear, the nose, the tongue, and the skin; (14–18), five instruments of action—viz., the organ of speech, the hands, the feet, the excretory termination of the intestines, and the organ of generation; lastly (19), *manas*, or the organ of volition and imagination. The five subtle elements (see 4–8) produce (20–24) the five gross elements—viz., *ākāśa*, space or ether, which has the property of audibleness, is the vehicle of sound, and is derived from the *sonorous* *tanmātrā*; air, which has the properties of audibleness and tangibility, is sensible to hearing and touch, and is derived from the *aerial* *tanmātrā*; fire, which has the properties of audibleness, tangibility, and colour, is sensible to hearing, touch, and sight, and is derived from the *igneous* *tanmātrā*; water, which has the properties of audibleness, tangibility, colour, and savour, is sensible to hearing, touch, sight, and taste, and is derived from the *aqueous* *tanmātrā*; lastly, earth, which unites the properties of audibleness, tangibility, colour, savour, and odour, is sensible to hearing, touch, sight, taste, and smell, and is derived from the *terrene* *tanmātrā*. The 25th principle is *Puruṣa*, or soul. It is neither produced nor productive; it is multitudinous, individual, sensitive, eternal, unalterable, and immaterial. The union of soul and nature takes place for the contemplation of nature, and for abstraction from it, 'as the halt and the blind join for conveyance and for guidance, the one bearing and directed, the other borne and directing.' From their union, creation is effected. The soul's wish is fruition or liberation. In order to become fit for fruition, the soul is in the first place invested with a *linga-sārtra*, or *sūkṣhma-sārtra*, a subtle body, which is composed of *buddhi* (2), *ahankāra* (3), the five *tanmātrās* (4–8), and the eleven instruments of sensation, action, and volition (9–19). This subtle body is affected by sentiments, but being too subtle to be capable of enjoyment, it becomes invested with a grosser body, which is composed of the five gross elements (20–24), or, according to some, of four, excluding *ākāśa*, or, according to others, of one alone—viz., earth. The grosser body, propagated by generation, perishes; the subtle frame, however, transmigrates through successive bodies, 'as a mimic shifts his disguises to represent various characters.' Some assume, besides, that between these two there

is intermediately a corporeal frame, composed of the five elements, but tenuous or refined, the so-called *anusūhāna-sārtra*.

Creation, resulting from the union of *Prakṛiti* (1) and *Puruṣa* (25), is *material*, or consisting of souls invested with gross bodies, and *intellectual*, or consisting of the affections of intellect, or sentiments or faculties. *Material creation* comprises eight orders of superior beings—gods, demigods, and demons; five of inferior beings—quadrupeds, birds, reptiles, fishes, and insects; besides vegetable and inorganic substances, and man, who forms a class apart. This material creation is again distributed into three classes: that of *sattva*, or goodness, comprising the higher gods, with virtue prevailing in it, but transient; that of *rajas*, or darkness, where foulness or passion predominates; it comprises demons and inferior beings, and between these, that of *gunas*, or impurity (a coloured condition), the human world, where passion together with misery prevails. Throughout the worlds, soul experiences pain, arising from death and transmigration, until it is finally liberated from its union with person. *Intellectual creation* comprises those affections which obstruct, disturb, content, or perfect, the understanding; it amounts to fifty. *Obstructions* of intellect are conceit, passion, hatred, fear, severally subdivided into 62 species. *Disability* of intellect arises from defect or injury of organs, such as deafness, blindness, &c., and from the contraries of the two classes; making a total of 28 species. *Contentment* is either internal or external—the one fourfold, the other fivefold. Internal contentment concerns near proximate cause, time, and luck; external contentment relates to abstinence from enjoyment upon temporary motives—viz., aversion to the trouble of acquisition, or to that of preservation, and reluctance to its loss consequent on use, or evil attending on fruit, or offence of hurting objects by the enjoyment of them. The *Perfecting* of intellect comprises 13 species; it is direct, as preventing the three kinds of pain; or indirect, such as reasoning, oral instruction, amicable intercourse, &c.

Besides the 25 principles, the Sāṅkhya also teaches that nature has three essential *guṇas*, or qualities—viz., *sattva*, the quality of goodness or purity; *rajas* (lit. colouredness), the quality of passion; and *gunas* the quality of sin or darkness; and it classifies accordingly material and intellectual creation. Thus the properties of intellect partake of goodness or purity—viz., virtue, knowledge, dispassionateness, power; and four, the reverse of the former, partake of sin or darkness—viz., sin, error, incontinence, and powerlessness. It is worthy of notice that by power the Sāṅkhya understands eight faculties—viz., that of shrinking into a minute form, in which everything is pervious; of enlarging to a gigantic body; of assuming extreme levity; of possessing unlimited reach of organs; of irresistible will; dominion over all beings, animate or inanimate; the faculty of changing the course of nature; the ability to accomplish everything desired. The knowledge of the principles, and hence the true doctrine, is, according to the Sāṅkhya, obtained by three kinds of evidence—viz., perception, inference, and right affirmation, which some understand to mean the revelation of the Veda and authoritative tradition.

It will be seen from the foregoing summary that the Sāṅkhya proper does not teach the existence of a supreme Being, by whom Nature and Soul were created, and by whom the world is ruled. It was therefore accused by its opponents to be atheistical, or to deny the existence of a creator, and it is the special object of the Yoga system

to remove this reproach, by asserting his existence, and defining his essence (see YOGA). The truth, however, is, that the Sāṅkhya proper merely maintains that there is no proof for the existence of a supreme Being; and the passages quoted by the opponents, to shew that the founder of the Sāṅkhya taught *Iśvara*, or a supreme God, are quite incompatible with the view, that he confined his teaching to those *tattvas* or principles which, in our opinion, were capable of demonstration. Nor is it at all probable that the founder of the orthodox Yoga would have propounded his system as supplementary to that of the Sāṅkhya proper, had there been that incompatible antagonism between them which must separate an atheistical from a theistical philosophy. The Sāṅkhya system underwent a mythological development in the Purāṇas (q. v.), the most important of which it is followed as the basis of their cosmogony. Thus, *Prakṛiti*, or nature, is identified by them with *Māyā*, or the energy of Brahman; and the Matsya-Purāṇa affirms that *Buddhi*, or *Mahat*, the intellectual principle, through the three qualities, goodness, passion, and ignorance, being one form, becomes the three gods, Brahman, Vishnu, and Śiva. The most important development, however, of the Sāṅkhya is that by the Buddhist doctrine, which is mainly based on it. The Sāṅkhya system is probably the oldest of the Hindu systems of philosophy; for its chief principles are, with more or less detail, already contained in the chief Upanishads (see VEDA); but whether the form in which it has come down to us, and in which it is now spoken of as the Sāṅkhya, is so older than that in which the other systems are reserved, is a question as yet not solved by Sanscrit philology. That this form, however, is not the latest one, is borne out, for instance, by the differences which exist between the Sāṅkhya doctrine of the Upanishads and the doctrine propounded in the text book of the Institutes of Manu on the one side, and the doctrine of the actual Sāṅkhya on the other.

The reputed founder of the actual Sāṅkhya is Kapila (lit. *tanony*), who is asserted to have been a son of Brahman, or, as others prefer, an incarnation of Vishnu. He taught his system in Sūtras (q. v.), which, distributed in six lectures, bear the name of *Sāṅkhya-Pravachana*. The oldest commentary on his work is that by *Aniruddha*; another, is that by *Vijñānabhikṣu*. The best summary of the Sāṅkhya doctrine is given by *Iśvara Kṛishṇa*, in his *Sāṅkhya-Kārikā*, edited by H. H. Wilson, with translation of the text by H. T. Colebrooke, and a translation of the commentary of Gaudapāda by himself (Oxford, 1837). For the various theories concerning the word Sāṅkhya, and the founder of the system, Kapila, and for the literature relating to it, see the elaborate and excellent preface by Fitzedward Hall to his edition of the *Sāṅkhya-Pravachana*, with the commentary of Vijñānabhikṣu, in the *Bibliotheca Indica* (Calcutta, 1856); and see also his valuable *Contribution towards an index to the Bibliography of the Indian Philosophical systems* (Calcutta, 1859). Amongst essays on the Sāṅkhya philosophy, the most reliable still remains that by H. T. Colebrooke, reprinted from the *Transactions of the Royal Asiatic Society*, in his *Posthumous Essays* (London, 1837), vol. i. p. 227, ff.

SAN LU'CAR DE BARRAMEDA, a seaport of Andalusia, in the modern province of Cadiz, and 18 miles north of the port of that name, stands on a sandy, undulating tract on the left bank of the Guadalquivir, and at the mouth of that river. It is a dull decaying place, and is notable chiefly as the mart whence inferior and adulterated vintages are exported to England as sherries. Pop. 16,000.

SAN LU'IS POTO'SI, a considerable town of Mexico, capital of the state of the same name, stands near the source of the river Tampico, and 200 miles west of the port of that name on the Mexican Gulf. It stands on a plateau 6350 feet above sea-level, is well built, containing many handsome edifices, chiefly ecclesiastical, and is surrounded by gardens. Its markets are well supplied, and it carries on a considerable trade with the neighbouring states. Shoes, hats, and hardware are the chief manufactures, and woven fabrics and liquors are imported from Tampico. Pop. 33,600.

SAN MARINO. See MARINO, SAN.

SAN MIGUEL, a town of Central America, in San Salvador, and about 80 miles east of the city of that name. It is said to be the chief trading town in Central America. At its annual fair of La Paz, 15,000 strangers assemble, and business to the amount of 2,000,000 dollars is transacted. About five miles west of S. M. is a volcano, 6680 feet high, which was in a state of eruption in 1848, and again in 1855.

SAN MINIA'TO, a city of Central Italy, province of Florence, and 21 miles west-south-west of the city of that name. S. M. is a fine old episcopal city, adorned with many monuments, and is famous in the history of the Florentine Republic. Pop. 15,599.

SANNAZARO, JACOPO, a distinguished Italian poet, of Spanish descent, was born at Naples, July 23, 1483. Love for a young lady called Carmosina Bonifacia, whom he has celebrated under the names of Harmosine and Filli, was what developed his poetical faculty. The lady being insensible to his passion, he sought to forget her in travel. It was during his absence that he composed the *Arcadia*, a medley of prose and verse, of which Tiraboschi, the historian of Italian literature, thus speaks: 'The elegance of the style, the propriety and the choiceness of the expressions, the descriptions, the imagery—everything, in fact, is fresh and original.' The work was greatly admired, and in the course of a century went through sixty editions. It has given its author the reputation of being an Italian classic. S., after his return to Italy, was invited to the Neapolitan court, and composed some comedies for the amusement of the royal family, of which only one has been preserved. He died at Naples in 1530 or 1532. His other productions are *Sonetti e Canzoni*, *Elogia VI.* (reckoned by some his most perfect performance); *Elegiarum Libri III.*; *De Morte Christi ad Mortales Lamentatio*; and *De Partu Virginis, Libri III.*, mostly written in Latin verse. S.'s life has been written by Crispo and J. A. Volpi. See also Tiraboschi's *Storia della Letterat. Ital. VII. Part iii.*

SAN NICA'NDRO GARGANICO, a town of Southern Italy, in the province of Foggia, 26 miles north of the city of Foggia. Pop. 8186. It is situated on Mount Gargano, and is one of the most populous towns among those mountains. The lands belonging to it are very fertile, and great herds of cattle and sheep are reared there. It trades in grain, wool, and wine.

SAN NICOLAS, or **SAN NICOLÃO**, one of the Cape Verd Islands (q. v.), and residence of the bishop of the group.

SAN REMO, a city of Northern Italy, province of Porto Maurizio, 27 miles east-north-east of Nice. It is built on the slope of a rising ground on the shores of the Mediterranean. Its fine cathedral, the Santuario della Guardia, and the Santuario dell'Assunta are worthy of notice, the last having four handsome pillars of alabaster. The palace of the Marquis Borrea D'Olmo contains a fine picture-gallery.

There is a seminary for priests, besides a college and many schools. Its little harbour carries on a brisk trade in oils and lemons. Nine foreign consuls reside in the town. S. R. is an ancient city, and obscure in its origin. In 1170, it was self-governed, and made an alliance with the Genoese against the Pisans. One of its bishops afterwards sold it to Genoa. 'San Remo is perhaps the mildest situation on all the Riviera. Here palms, lemon, and orange-trees grow with the greatest luxuriance, and the fruit of the date palm almost attains maturity.'—Murray's *Handbook*. In recent years, it has begun to be resorted to by English visitors, and several new and excellent hotels have been erected. Pop. 11,000.

SAN ROQUE, a town of Spain, in the modern province of Cadiz, on the bay of Gibraltar, and eight miles north-north-west of the town of that name. The salubrity of the climate, and the cheapness of living, have attracted hither many foreign families, especially English. Pop. about 7000.

SAN SALVADOR, the smallest, though the second in point of population, of the Central American Republics (see *AMERICA*), consists of a strip of territory stretching along between Honduras and the Pacific, and bounded on the W. by Guatemala, and on the E. by Fonseca Bay, which separates it from Nicaragua. It averages 180 miles in length, by about 40 in breadth, and contains an area of 7230 English sq. m., with a population (according to the most recent estimate) of 600,000, or 83 to the sq. mile. The northern frontier is formed by a portion of the great Cordillera chain, and parallel to this range, and between it and the Pacific sea-board, runs another range of mountains along the whole length of the country, breaking it up into an inland valley, and a long low rich belt along the coast. This central range is highly volcanic in character, and has 16 volcanic peaks, ranging in height from 7386 to 4000 feet high. S. S. possesses numerous lakes, the largest of which is Guija, about 90 miles in circumference, and abounding in fish. The greater portion of the interior valley, and the alluvial strip lying along the coast, are of extreme fertility, and agriculture is extensively and successfully practised, to the almost total exclusion of pastoral pursuits. The principal agricultural products are indigo, sugar, and maize, cotton also being successfully cultivated in the districts around La Libertad and the Bay of Jiquilisco. The coast from Acajutla (30 miles from the western frontier) to La Libertad is known as the *Costa del Balsamo*, or Balsam Coast, as in the woods of this district is produced the famous balsam known as 'Balsam of Peru,' in such quantities that from 17,600 to 22,000 lbs. av. are annually exported. The mineral wealth of S. S. is not great, but rich veins of silver are found at Tabasco in the north-east, and mines of iron in the west near Santa Ana. S. S. has considerable export trade in indigo (which is known in trade as 'indigo of Guatemala,' and is reckoned the finest of all) and sugar, as well as turpentine, cocoa, cotton, and spices. In 1870, the value of exports amounted to about 3,810,910 dollars, and that of imports to 2,551,560 dollars; and in 1869, 23 steamers and 27 sailing vessels, amounting to 32,598 tons, entered and cleared the ports of the republic.

The climate of S. S. is salubrious, and the temperature is lower than might be expected from the low latitude and general want of elevation of the country.

The population is composed of whites (of Spanish origin), Indians, *Ladinos* (of mixed white and Indian blood), negroes, and mulattoes. The whites form little more than one-fifth, the Indians one-third.

The Indians are of the Aztec race, speak the Spanish language, and profess the Roman Catholic religion (the one established by statute), but retain many of their old heathen rites, and are in a certain degree apart from the rest of the population. They have the rights of citizens, but generally exercise them under the advice of the government. The government is carried on by a president, vice-president, and two ministers, one for foreign affairs and finance, and the other for internal business and war. The legislature consists of two chambers, an upper one of 12 senators, and a lower of 24 representatives. Education is well provided for, every village of 50 inhabitants being bound by law to support a school, and there is a university in the capital, San Salvador, which is well endowed by the state. The standing army is 1000 men.

S. S. originally called *Cuscatlan*, 'the land of riches,' is said to have been, previous to the immigration of Europeans, the best peopled and most civilised country in America. It was conquered after a long and obstinate contest by Pedro de Alvarado, a lieutenant of Cortes, and under the Spanish rule was one of the most flourishing portions of the Guatemalan kingdom. In 1821, it threw off the yoke, and joined the Mexican Confederation, from which, however, it seceded in 1823. The several trials since made of a union among the Central American States have ended in the dissolution of all political connection; and S. S. is now an independent republic. In 1863, war broke out between S. S. and Guatemala, in which Honduras joined the former, and Nicaragua the latter. The result was the defeat of S. S., and the expulsion of the president from the country. The government has taken active measures towards developing the resources of the country.

SAN SALVADOR, the capital of the republic of San Salvador, was founded in 1589, and replaced an older town which had been built in 1535 by a brother of Pedro de Alvarado. It was the capital of the Union of Central America from 1823 till 1839. In 1854, it was a fine, well-built city, adorned with numerous splendid buildings, and containing a population of more than 30,000; but on the night of April 16th it was completely destroyed by an earthquake, and about 100 lives lost. In January 1855, it again became the seat of government, and its population is now about 20,000. The trade, which equally suffered, is gradually assuming its former flourishing condition, and is carried on mostly through the port of La Libertad, which is about five miles distant.

SANSANDING, a large town in the north-west of Africa, in Bambarra, about 20 miles north-west of Segou, on the left bank of the Niger, here called the Joliba. A considerable trade in salt, beads, coral, gold-dust, and cotton cloth is here carried on. Pop. from 10,000 to 11,000.

SANSÇARA, or **SANSKARA** (lit. completing, perfecting), is the name of the ten essential rites or ceremonies of the Hindus of the first three castes. They are the ceremonies to be performed at the conception of a child; on vitality in the fetus, in the fourth, sixth, or eighth month of pregnancy; and at the time of his birth, before dividing the navel-string; the ceremony of naming the child on the tenth, eleventh, or hundred-and-first day; the ceremony of carrying the child out to see the moon on the third lunar day of the third light fortnight; to see the sun in the third or fourth month; of feeding him in the sixth or eighth month (or at other stated periods); the ceremony of tonsure in the second or third year; of investiture with the string in the

15th, eighth, or sixteenth year—when he is handed over to a *guru* to become a religious student; and the ceremony of marriage, after he has completed his studies, and is fit to perform the sacrifices ordained by his sacred writings.

SANSKRIT, or **SANSKRIT** (from the Sanskrit *am* = Gr. *syn*, 'with, together,' and *kr̥ita*, 'done,' with an epenthetic *s*, imparting greater emphasis to the sense of the compound; hence, 'thoroughly done, finished, accomplished') is the name of the ancient language of the Hindus; in which their whole sacred literature, and by far the greatest amount of their numerous ritual, legal, poetical, and scientific works, are written. S. belongs to that stock of languages commonly called the Indo-European, or Indo-Germanic, which includes the Indian, the Indo-Persian, the Græco-Latin, the Germanic, the Lithuanian-Slavonian, and the Gallo-Celtic families. It is therefore intimately allied to the ancient and modern languages comprised in each of these families, itself being the parent of the *Prākṛit* (q. v.) dialects, the *Pāli* (q. v.), and the languages spoken in the north of India. Compared with the ancient languages kindred with it, S. has come down to us in a state of preservation and development so much superior to theirs, that it must be looked upon as the principal means which enables us to understand the finity, and in general the linguistic laws which pervade the structure of these languages. The essay of Franz Bopp, *Ueber das Conjugations system der Sanskrit Sprache*, dated 16th May 1816, began a new era in the study of language. See **PHILOLOGY**, BOPP.

There are two great periods into which the history of the S. language may be conveniently divided: the first embracing the language as contained in the Vedic hymns (see **VEDA**); and the second, that represented by the so-called classical S., in which the epic works, the law codes, and the later literature are written. Between the two there is a transition period of the language, to which the Brāhman's and ritual portion of the Vedas, and the Upanishads, may be assigned. In the language of the Vedic hymns, the grammar is less developed and much less settled than in the classical S.; it contains, moreover, many forms which at the second period became obsolete, or altogether disappeared from use; the structure of its sentences, too, is simpler, though it is more elliptical than in classical poetry. Another main difference between the two periods lies in the sense of its words. Though this is the same in many words of the Vedic hymns and the classical literature, still there are numerous words, which, though the same in form at both periods, have a sense which differs according as it belongs to the one or the other class of writings. The difficulty thus presented by the Vedic hymns is in a great measure removed by the commentators who explain the meanings of the Vedic words, and, in doing so, follow tradition, which, considering the peculiarities of Hindu history, and also internal evidence, is in all probability immemorial, and therefore the safest if not the only guide in the understanding of the oldest Vedic works. That their explanations may have become unsafe in some instances, would be but natural; but it is certain that these instances are the rare exceptions; and it is likewise certain that when modern Sanskritists—and several of these only imperfectly acquainted with S. grammar—have attempted to supersede those traditional meanings by interpretations which they suppose better suited to the context, or to some assumed etymology of their own, their rendering may better adapt the Vedic to the classical vocabulary, but is sure to falsify that understanding which the Hindu mind had of its oldest and most sacred works, and on which its

further historical development is based. In the transition period of the Brāhman's and ritual portion of the Vedas and the Upanishads, grammar and vocabulary offer similar difficulties to those of the Vedic hymns; but though for this reason the aid of the commentaries is likewise indispensable, they are much less numerous; and in those works of this extended period, which probably were composed at the classical epoch, the difference between the two is even inconsiderable. In comparing S. with other kindred languages, it is therefore necessary not to lose sight of these periods of the language, and of the peculiarities inherent in them.

SANSKRIT LITERATURE. The most natural, and, at the same time, the most scientific distribution of Sanskrit literature would be that according to the dates at which its writings were composed. The actual condition of Sanskrit philology, however, renders such a course impossible; for, with the exception of very few works, no date whatever is known to which they could be safely assigned. (See **INDIA—Religion**; **VEDA**.) In spite, therefore, of an apparent plausibility with which some authors have propounded a regular literary chronology of Sanskrit works, even with figures or dates appended to them, the general reader will do well to look upon all such dates as imaginary, and to rest satisfied with the hope, that perhaps future results of Sanskrit philology may afford a more satisfactory settlement of this vexed question of Sanskrit chronology. Under these circumstances, the only possible arrangement of Sanskrit literature is that suggested by their contents, irrespectively of the time at which they were composed, but, under each head, in that order which, within large margins, may be suggestive of consecutiveness.

1. *Religious Literature.*—It comprises, in the first place, the Vedas, and the mystical, philosophical, and ritual works connected with them (see **VEDA** and **UPANISHAD**); and secondly, the **PURĀṆAS** (q. v.) and **TANTRAS** (q. v.), besides prayer-books and smaller works, and treatises of less importance relating to the modern worship, based on the two latter classes of works.

2. *Law Literature.*—It is comprised under the name of *Dharmasāstra* (from *dharma*, law—religious and civil—and *śāstra*, book), and its origin is traceable to the ritual Sūtras relating to the Vedas. A complete *Dharmasāstra* consists of three portions: the first treating of *Āchāra*, or 'established rules of conduct,' comprising such matters as education, marriage, the funeral rites, the duties of a king, &c.; the second treating of *Vyavahāra*, or judicature, including law, private and criminal, and under the former, for instance, the law of inheritance and adoption; the third, on *Prāyaścitta*, or penance, treating, besides this subject, also of impurity, the duties of a devotee, transmigration, and final beatitude. The chief extant representatives of this class are the codes of **MANU** (q. v.) and **YĀJÑAVALKYA** (q. v.). Less complete than the latter—for it does not contain the *Vyavahāra* portion—is the code of **PARĀŚARA** (q. v.); but it deserves special mention, as the modern Hindus consider it to have been especially composed for the requirements of the Kaliyuga, or the present mundane age, and as it is cited, therefore, as the authority, for instance, on the question, and in favour, of the remarriage of Hindu widows. For practical purposes, especially those concerning *Vyavahāra*, the chief actual authorities are the commentaries on *Manu*, *Yājñavalkya*, and similar works, and the digests which have grown up from them. Amongst the former, the **MĪTAKSHARĀ** (q. v.), by Vijnānēśwara, occupies the principal rank; and amongst the latter, the *Chintāmanī*,

Vramitrodaya, *Vyavahāra-mayākha*, *Smṛtiśāh-drikā*, and *Vyavahāra-Mādhaviya*, which generally defer to the authority of the *Mitāksharā*; and, besides these, the *Dāyabhāga* of Jimūtavāhana, which, like the *Dāyatattva* of Raghunandana, differs from it on several important questions, for instance, on that relating to the hereditary rights of women. (See MITĀKSHARĀ.) As on the Vyavahāra, there are numerous smaller treatises on the Achāra and Prāyascitta.

3. *Poetical Literature*.—(a.) The two great epic poems. See RĀMĀYANA and MAHĀBHĀRATA.

(b.) *The Modern Epic Poems*.—Their subject-matter is entirely borrowed from the two great epic poems and other legendary works; and their only merit consists in the art bestowed by their authors on the versification, and all that relates to the æsthetical canon of Hindu poets, which, in some respects, may meet with the approbation of western critics, but, in others, would require in the European reader a total abnegation of his ideas of poetical beauty, in order to make these poems acceptable to him. Minute descriptiveness, elaborateness of diction, and an abundance of figures of speech, are some of the characteristics of these poems, amongst which those of Kālidāsa approach nearest our standard of poetical worth. One of them, the *Bhātikāvya*, which relates to the history of Rāma, was purposely composed for illustrating rules of grammar and formations of words of special interest. In another, the *Rāghava-Pāṇḍaviya*, the ambiguity of the diction is so studied, that the poem may be interpreted as relating to the history of Rāma, or other descendants of Daśaratha (see RĀMĀYANA), or to that of the descendants of Pāṇḍu (see MAHĀBHĀRATA). The following are the *Mahākāvya* or great poems of this class: the *Raghuvansā* and *Kumārāsambhava*, by Kālidāsa (q.v.); the *Nalodaya*, also ascribed, though probably wrongly, to the same poet; the *Bhātikāvya*, or the poem by Bhāṭṭi; the *Sisupadabaddha*, by Māgha, hence also called the *Māghakāvya*; the *Naishadīyacharita*, by Śrīharsha; the *Kirdār-juntha*, by Bhāravi; and the *Rāghava-Pāṇḍaviya*, by Kavirāja (i.e., the prince of poets), as the author calls himself.

(c.) *Lyric and Erotic Poetry*.—Several works of this class are more of a descriptive character, and would differ therefore from what in European poetry might be included under this head. The principal works belonging to it are the following: the *Ritūsanhāra*, or a description of the seasons, attributed to Kālidāsa (q.v.); the *Meghadūta*, or the cloud-messenger, also supposed to have been written by Kālidāsa—a poem in which a demigod, separated by fate from his wife, is imagined to make a cloud the messenger to her of his woes, and incidentally, as it were, describes his course over a large tract of India; the *Amarāśataka*, or hundred stanzas of Amaru, on amatory feelings and scenes, the natural sense of which commentators have twisted also into one of a mystical character, so as to make them appear less objectionable, especially as they were supposed by some to have been composed by the celebrated theologian Sankara, when he had animated the dead body of King Amaru (see SANKARA); these stanzas have an epigrammatic character, and share in this respect the style of the first S'ataka, or hundred verses on love, by Bhārṭṭi-hari; the *Blāminīvilāsa*, by Jagannātha Paṇḍitarāja, in four books, the second of which is connected with amatory subjects, while the third is a beautiful elegy on the death of the poet's wife; the *Gitagovinda*, by Jayadeva, who probably lived in the 12th c., which, in ten sections, describes the amours of Kṛishṇa with the cowherdesses, his separation from his wife Rādhā, and his ultimate reconciliation

with her, and which, like the *Amarāśataka*, has also been explained in a mystical sense, Kṛishṇa then being represented as the soul which for a time becomes estranged from the supreme soul, its original source, but finally returns to it. The poem differs from those mentioned before in being intended for singing and for representation at a festival held in honour of Viṣṇu; it combines the lyric and the melo-dramatic character.

(d.) *Didactic Poetry*.—A portion of this class of poetry may be included under the former head, as even such works as the *Amarāśataka*, and the erotic stanzas of *Bhārṭṭi-hari* have much of the sententious character; another is contained in the episodes of the *Mahābhārata*, and another forms a considerable portion of the books of fables. The chief special representatives of this class are the three *S'atakas*, or hundred stanzas on love, prudence, and wise conduct, and renunciation of worldly desires, by *Bhārṭṭi-hari*. Similar pieces of poetry are the hundred stanzas of *Chāṇakya*, and stanzas in the anthology of *Saṁgadhara*, called *S'ārngadhara-paddhati*. Others have been collected in various modern anthologies, such as the *Nūpūṭkalana* and the *Kavīśmṛitakāpa*. For the poem *Bhagavadgītā*, see under YOGA.

(e.) *Dramas*.—The plays of the Hindus are numerous; they were only acted on special occasions, and the subject of the plot is with prediction borrowed from the legendary literature of ancient India. Hindu dramatists have little regard for unity of time, place, and action; and with the exception of Kālidāsa, they must be considered inferior in poetical worth to the renowned dramatists of ancient Greece and of modern Europe. Besides the reasons to be sought for in the religious, mystical, and metaphysical tendencies of the Hindu mind, a free development of the Hindu drama was probably also impeded by the heavy and artificial canon which weighed upon Hindu dramaturgy, and which, ascribed to sacred sources, and looked upon as a law not to be transgressed by any dramatist, did not allow much scope for poetical imagination, and would keep down any free movement which it might have ventured. The various kinds of dramatic performances, the number of their characters, the characters of the plays, the conduct of the sentiments to be represented, and even the modes of diction—all these were strictly regulated so much so, that in spite of the differences which must exist between different authors and plays, there is still a kind of uniformity which pervades the whole Hindu drama, and must strike any unacquainted with this elaborate dramaturgy. It must suffice here to mention a few of its peculiarities. All dramatic composition is divided, according to it, into two great classes—the *Rūpaka*, or performance, and the *Upārūpaka*, or the *Rūpaka*; the former containing ten species, the *Nāṭaka*, or the play, *par excellence*, which represents exalted personages, down to the *hasana*, or farcical comedy; and the latter eighteen species. Neither class contains the species of 'tragedy'—which is incompatible with a belief in fate, one of the main features of the Hindu mind. Every drama opens with a prelude in the form of a dialogue between the stage-manager and one of his company, in which the name of the author and his work, and such prior events as the spectators should know, are brought before the audience. The first part of this prelude is a prayer invoking the benediction of some deity in favour of the audience. The piece thus being opened, is then carried out in the usual manner; but so long as the same actors on the stage is never left empty, but the entrance of a new personage is always announced by a spec-

person. The piece closes as it began, with a benediction. The principal characters of the play are the hero (*ndyaka*) and the heroine (*ndyikā*). The former is either *lalita*, gay, thoughtless, and good-humoured; or *śānta*, gentle and virtuous; or *dhitro-dāta*, high-spirited, but temperate and firm; or *śūlata*, ardent and ambitious; but as each of these categories is again subdivided, they become multiplied to 144 kinds. Equal minuteness is displayed in specifying the classes of the heroines. The hero has his antagonist in the *pratinidya*, or counter-hero; and each of these may have his officers, ministers, and friends. The heroine, on her part, has always a confidential companion, who is often her foster-sister. The subordinate characters are described as being eunuchs, mutes, dwarfs, foresters or barbarians. Two characters, however, deserve special notice, as being peculiar to the Hindu stage—the *Vīṭa* and the *Viddhaka*. The *Vīṭa* may be the companion of a man or woman; he is generally on familiar, yet dependent terms, with his associate, and though somewhat like the parasite of the Greek comedy, yet not rendered contemptible; if a female, she is a courtesan. The *Viddhaka* is the humble companion of a prince or man of rank; he is always lively, sometimes witty, and, according to the definition of his attributes, he is to excite mirth by being ridiculous in person, age, and attire. He is, curiously enough, always a Brahman. The plays have eight, or, according to some, nine *rasa*, or characteristic flavours: these *rasas* are love, mirth, tenderness, fierceness, heroism, terror, disgust, wonder, and tranquillity; and they again consist of conditions with numerous divisions and subdivisions. The manner according to which the form of speech is regulated, is another peculiarity of the Hindu drama. Only the hero and the principal personages speak Sanskrit, but women—with rare exceptions—and the inferior personages speak Prakrit; the various, higher or inferior, idioms of that language being adapted to their higher or inferior character. See PRAKRIT. The oldest known Sanskrit drama is the *Mricchakatikā*, or 'the Clay Cart,' by King Śūdraka, which, in the opinion of H. H. Wilson—who translated it in his *Select Specimens of the Theatre of the Hindus*—was written in the 1st c. B.C. Of other dramas may here be mentioned *Abhijñānaśakuntalā* (see ŚAKUNTALĀ) and *Vikramorvaś*, by Kālidāsa (q. v.), to whom also the drama *Māla-rāghavī* is attributed; *Mālakarmadhava*, *Maharācharita*, and *Uttarārdmacharita*, by Bhavabhūti; *Ratnadrū*, by Śrīharsha; *Mudrārāghava*, by Viśakhadatta; *Hanumannāṭaka*, fabled to have been composed by the monkey Hanumat (q. v.); and *Anarjharāghava*, by Mūrāri. A drama of a peculiar nature is the *Prabodhachandrodaya*, by Kṛishnā-misra, who, in the opinion of Goldstücker, expressed in the preface to his translation of this drama, lived at the end of the 12th century. Its leading personages are all of a transcendental kind; such as the supreme spirit, faith in Viāhnu, volition, organ of imagination, opinion, devotion, quietude, friendship, &c., on the one side; and error, egotism, hypocrisy, love, voluptuousness, anger, avariciousness, &c., on the other; and its object is to represent the victory of the former over the latter. The general dullness of the play is relieved by a number of sectarian worshippers, who appear on the scene, each eulogising the truth of his own religion, and ridiculing that of his antagonist. That this drama, which would baffle the patience of a European audience, was acted before King Kirtivarman, who, with his whole assembly, was very eager to see it, the poet relates in the prelude to it. An imitation of this drama is the *Chaitanyachandrodaya*, by Kavikarnā-pura. For the translation of several of these dramas,

and an account of others, see H. H. Wilson's *Select Specimens of the Theatre of the Hindus* (2 vols., London, 1835).

(f.) *Fables and Narratives*.—Fables, as such, occur, and are referred to, as early as in the great epic poems; but the oldest collection of fables is the *Panchatantra* (q. v.); and after it, the *Hitopadesa* (q. v.). These works are considered by the Hindus to belong to the class called *nitishāstra*, or works on conduct and polity, since the morals drawn from the fables, and expressed in sententious verses, with which they are interwoven, are the object for which these collections were made. A different class of writings are the ghost-stories, merely composed for amusement, such as the *Vellāpanchavinsati*, or the 25 tales of the vampire; and the *Sukasaptati*, or the 70 tales of the parrot; and the *Sinhāsana-dvātrinsati*, or the 32 tales of the statues on the throne of Vikramāditya. A work of a higher order is the *Vṛī-hatkaithā*, 'the Grand Tale,' or *Kaithāsaritāgarā*, 'the Ocean for the Rivers of Tales,' by Somadeva of Cashmere. Amongst narratives of the romance class, the most celebrated are, the *Dasakumāracharita*, or the 'Adventures of the Ten Princes,' by Dan'din, who lived about the middle of the 11th c., edited, with an elaborate preface, by H. H. Wilson; *Kadambari*, by Vānabhatta; and the *Vāsavadattā*, by Subandhu, a critical account of which work is given by Fitzedward Hall, in the preface to his edition of it (Calcutta, 1859).

(g.) *Chronicles*.—Historical works, in the European sense of the word, do not exist in Sanskrit literature. The same causes which have clouded all Hindu chronology, and even, at recent periods of Hindu history, have transformed historical facts into myths, seem to have rendered the Hindu mind indifferent to the research and the recording of historical truth. The only approach to historical works is found in some chronicles, though these, also, are not devoid of fictitious narratives. The most renowned among them is the *Rājataranginī* (q. v.), or the Chronicle of Cashmere, by Kalhana. A modern work of a similar kind, but of much smaller extent, is the *Keshitā avasāvalīcharita*, or the Chronicle of a series of royal families who reigned in Bengal. It was composed in the middle of the last century.

4. *Scientific Literature*.—(a.) *Philosophy*. See the articles SĀNKHYA, YOGA, NYĀYA, VAISĒSHIKA, MIMĀNSĀ, VEDĀNTA.

(b.) *Grammar*.—That a scientific study of grammar was cultivated at a very early period of Hindu literature, is borne out by the testimony of the oldest glossator on the Vedas, YĀSKA (q. v.). The oldest extant work, however, on Sanskrit grammar is posterior to the work of Yāska; it is the grammar of Pānini (q. v.), which was criticised by Kātyāyana (q. v.) in the *Vārttikas*, these, again, being commented on and criticised by Patanjali in the *Mahābhāṣya*. (See PĀNINI, where some of the principal later works connected with his system are mentioned.) That the *Prātisādhya*s (see VEDA) did not precede the grammar of Pānini, has been shewn by Goldstücker in his *Pānini, his Position in Sanskrit Literature*, &c. Of authors of grammars, not following the technical system of Pānini, the principal are, Hemachandra, a Jaina (q. v.) writer, and Vopadeva, who probably lived about six centuries ago, and is especially esteemed in Bengal.

(c.) *Lexicography*.—It consists of glossaries of words and *dhatūs*—a term which may be vaguely rendered by 'roots,' or 'radicals,' though it does not imply, to the Hindu grammarian, the idea of a linguistic element—and of commentaries on these glossaries. The oldest known glossary of Vedic words—nouns and verbs—is the *Nirukta* (q. v.) of

Yāska. Renowned glossaries of classical words are the *Amarakośha*, by Amarasinha, who is probably not later than the 3d c. after Christ; the *Abhināratnamālā*, by Halyudha; the *Haimakośha*, by Hemachandra; and the *Viśvapradīpa*, by Maheswara. (For other works of this class, see Wilson's *Sanskrit English Dictionary*, preface to 1st ed., 1819; and Colebrooke's *Miscellaneous Essays*, vol. i. p. 50, ff.) The glossaries of *dhātus* are called *Dhātupadīhas*. The oldest was probably composed by Pāṇini himself, and is the groundwork of the existing works of this name, though the latter contain numerous additions of later forms. The chief commentary on the *Dhātupadīha* is that by the celebrated Mādhavachārya (q. v.).

(d.) **Prosody.**—Sanskrit prosody admits three sorts of metre: one governed by the number of syllables, and which is mostly uniform, or monoschematic, in profane poetry, but not so in various passages of the Vedas; the other regulated by feet equivalent to two long syllables, or to four short; and the third regulated by the proportion of syllabic instants, without noticing the number of feet. Some Sūtras (q. v.) connected with the Vedas contain rules on the Vedic metres; but the principal work on Vedic as well as profane prosody is the *Chhandahśāstra*, by Pingala, which has been commented on by various writers, the most conspicuous of whom is Halyudhabhatṭa. A short treatise on prosody, which only exhibits the most common sorts of metre, the *Śrutabodha*, is attributed, but probably wrongly, to Kālidāsa (q. v.).

(e.) **Art of Poetry.**—It is treated in works on dramaturgy, and works on the poetical art in general. The oldest work on the dramatic art is the *Sūtra* of Bharata; a later one is the *Daśarūpa* by Dhanañjaya. Some of the principal works of the latter category are the *Kāvyaaprakāśa*, by Mammata, the *Kāvyadarśa*, by Daṇḍin, and the *Sāhityadarpana*, by Viśvanātha Kavirāja. Several other works of this class are especially concerned in the explanation of figures of speech.

(f.) **Works on Music.**—In general, they treat of notes, musical scales, melodies, the art of singing, and musical instruments; and some of them also of the art of dancing and performing. The melodies, or *Rāgas*, are represented as deities, who have wives, the *Rāginīs*. Their number is uniform in the different works, and it is probable that the passages in dramas and other poetical works intended for singing were written to suit these fixed melodies, and not that the melodies were composed after the poet had performed his task. The principal works of this kind are the *Saṅgitaratnākara*, by Śārṅgadeva, the *Saṅgitadarpana*, by Dāmodara, and the *Saṅgitadāmodara*, by Subhankara. Special treatises relate to the melodies alone.

(g.) **Amatory Art.**—Works treating of this art purport methodically to explain and to classify all that relates to love, and they refer for many of their statements to the oldest authorities. The chief work on this subject is the *Kāma-Sūtra* of Vātsyāyana.

(h.) **Astronomy and Arithmetic.**—The calendars connected with the Vedas are the earliest evidence of Hindu proficiency in astronomy; they presuppose a knowledge of a solar year of 365 days, and their date is assumed by Colebrooke to belong to the 13th c. B.C., while others would place them a few centuries later. The scientific works of later Hindu astronomers are professedly based on five ancient systems, or Siddhāntas, called the Paulīśa, Romaka, Varāha, Saura, and Paitamaha-Siddhānta; and the earliest renowned author among these astronomers is Āryabhaṭṭa, who, according to

Colebrooke's calculation, did not live later than the 5th c. after Christ. From the quotations by

Brahmagupta, it appears that Āryabhaṭṭa affirmed a diurnal revolution of the earth on its axis; that he possessed the true theory of the causes of lunar and solar eclipses, and that he noticed the nature of the solstitial and equinoctial points, but restricted it to a regular oscillation, of which he assigned a limit and the period. See, for further detail, Colebrooke's *Algebra*, &c. (Lond. 1817, p. 38). His

principal work, the *Āryabhaṭṭasāra*, is at present only known from the quotations of Brahmagupta, Bhaṭṭotpala, and others; but his other works

Dasagatīkā and *Āryabhaṭṭaśīṣya*, are extant. Varāhamihira, the next important astronomical writer, a native of Ujjayini, lived about the beginning of the 6th c. after Christ. His compilation of the five Siddhāntas, the *Panchasiddhāntikā*, is not yet recovered; but several of his astrological treatises and the scholia on them by Bhaṭṭotpala and others are preserved, and his *Brīhatsaṃhitā* has been recently edited by Dr H. Kern (Calc. 1865). Another great astronomical authority is Brahmagupta, who appears to have written towards the close of the sixth, or the beginning of the following century; his work bears the title of *Brahmasphuṭa*; and it was followed up by Bhāskara, who, in the middle of the 12th c., composed a celebrated work, the *Siddhāntasīromani*, translated by James Wilkinson (Calc. 1861). The *Sūryasiddhānta* has been edited by Fitzedward Hall (Calc. 1830). Two translations of it are due, one to E. Burgess in the *Journal of the American Oriental Society*, accompanied with notes by Whitney (New Eng. 1860); another to Bāpūdeva Śāstri (Calc. 1879), but whether this Siddhānta is the Saura, or the five original Siddhāntas above mentioned, is a later work bearing a similar title, is matter of doubt. That Hindu astronomy is largely indebted for its progress to the kindred sciences of western nations, may be inferred from the occurrence of Sanskrit terms which are of Arabic and Persian origin. Thus, the terms *horā*, *draśabha*, *kendra*, &c., are easily traced to the Greek *dekano*, *lepta*, *kentron*, &c.—That works on Hindu astronomy contain more or fewer chapters on passages which no longer concern astronomy, but belong to the sphere of astrology, can be no matter of surprise, considering the intimate connection which, in India, religion and superstition maintain with every branch of human knowledge, and more especially to one concerning the heavenly bodies. There are, moreover, numerous works which are purely astrological, merely treating of nature and the influence of the planets on certain parts of the day or month, and the occurrence of events would take place at them. Among certain writers on algebra, it must here suffice to mention Varāhamihira and Bhāskara. See Colebrooke's *Algebra*, as quoted above.

(i.) **Medicine.**—The origin of Hindu medicine is referred to the god Brahman, from whom the *Āyurveda*, or 'the science of long life,' was obtained by Dakṣha, who communicated it in his turn to Asvins. Some time after this, mankind became the victims of their wickedness, becoming afflicted with numerous diseases, the Munis, or sages, retired to the Himalaya Mountains to search for a remedy. A long list of these saints is given by Charaka, the greatest medical writer, and it is so interesting as it contains several names known in Hindu history, and which thus may be probably connected with the early study of Hindu medicine. The two greatest medical authorities the works of whom are still extant are Charaka and Susruta.

oth treat of the duties of physicians and their apils, of anatomy and physiology; hygeology; ateria medica, pharmacy, and preparations of edicine; surgery; the diagnosis, prognosis, and eatment of a considerable number of diseases; idwifery, toxicology, &c. Several chapters in em are devoted to omens and portents, as well as the evil influence of planets and demons on the man body. Charaka, who is older than Susruta, attains more mythological detail than the latter.

[the authorities quoted by Charaka, *Ātreya* seems ill preserved in a work, the *Ātreyaśāhikā*, which far less scientific and complete than either the ork of Charaka or Susruta, and therefore appears have preceded them.—See also T. A. Wise, *Commentary on the Hindu System of Medicine* (London, 1860).

(j). *Architecture*.—Treatises on architecture, sculpture, &c., are collectively called *Silpaśāstra*. There appear to have been 32, or, according to some, 64 standard treatises on these arts, but of these only a w are probably still in existence. The most important of them is the *Mānasaśāstra*, which consists of 58 chapters, each of which is devoted to a particular topic—such as measures used in architecture; e different sites to be selected for building temples d houses; the mode of determining the different ints of the compass; the several sorts of villages, wns, and cities, with directions for building them; e different parts of an edifice, its ornaments, details, bases, pillars, &c.; the various sorts of mples; the construction of porticoes, gates, palaces, ; the construction of images, and cars in which e gods are carried in procession, together with e ceremonies attending the consecration of images; e mode of determining the propitious moment for amencing to lay the foundation of an edifice, &c. e, for further detail, Rām Rāz, *Essay on the Archi- tecture of the Hindus* (London, 1834).

For a more copious supply of titles of books on e subjects mentioned, the reader may consult Kemeister, *Bibliotheca Sanscrita*, Bonn (1847), d the printed catalogues of the Library of the lia Office, of the Sanscrit MSS. of the Bodleian wrary at Oxford, and of the Sanscrit MSS. of the yal Library at Berlin.

SANSULOTTES, i. e., 'without breeches,' was e name given in scorn, at the beginning of the ench Revolution, by the court party to the demo- ists 'proletaires' of Paris. The latter accepted a superfluous reproach with sardonic pride, and e term soon became the distinctive appellation of good patriot,' more especially as such a one often ide a point of shewing his contempt for the rich ' neglecting his apparel, and cultivating rough d cynical manners. As the noblesse prided ell on an illustrious pedigree, so the genuine child the revolution boasted that he was come of a ng line of—notables sansculottes; that his

'Ancient but ignoble blood
Had crept through scoundrels ever since the flood.'

owards the close of the Convention, the name, nected as it had been with all the sanguinary scenes of the period, naturally fell into bad odour, d soon after totally disappeared; nor do the rench appear to wish that its memory should be reserved, for they have not given it a place in their encyclopædians.

SAN SEBASTIAN, a rising seaport city in the orth of Spain, capital of the Basque province of upuscoa, 381 miles north-north-east of Madrid y the North of Spain Railway. It is built on a minisula, at the southern base of a conical hill, lled Mont Orgullo, 400 feet high, commanding

a most striking view, and crowned with a castle strong enough to have obtained for itself the name of the Gibraltar of the north of Spain. Since its almost total destruction during the Peninsular War, the town has been rebuilt on a regular rectangular plan. The streets are narrow, and are bordered by high houses, and having cur- tained balconies in front. On the east of the town is a confined gulf, formed by the embouchure of the Urumea; and on the west is a magnificent roadstead, protected against enemy and tempest by the isle of Santa-Clara, and a series of rocks, which offer to vessels only a narrow and dangerous pass. The roadstead is bordered by a beautiful shore, which, on account of its suitability as a watering- place, attracts visitors from all parts of the country. The town communicates with the mainland by a narrow tongue of land, and by a bridge leading across the Urumea, and connecting S. S. on the peninsula with the railway station on the mainland. By means of the North of Spain Railway, which was inaugurated by the king of Spain, 15th August 1864, the town is placed in direct communication with Madrid and Paris. S. S. is the seat of an increasing commerce. In 1863, 2112 vessels (includ- ing those engaged in the coasting-trade), of 152,474 tons, entered and cleared the port. The exports consist principally of wool, flour, wine, cutlery, firearms, copper-ore, and lead; the imports are salted fish, sugar, silk and cotton and linen goods, cocoa, machinery, coffee, timber, and iron-wares. In 1863, coal, coke, wagons, rails, &c., for the new railway, were imported from Great Britain, France, and Belgium to the value of £538,706. Pop. esti- mated at 16,900.

S. S. has suffered from numerous sieges in the wars between France and Spain. It was captured by the Duke of Wellington in 1813, when the dis- possessed French garrison set it on fire.

SAN SEVERINO, a city of Central Italy, province of Macerata, 15 miles west-south-west of the city of that name. It is well built, and has handsome palaces, the finest of which are the Palazzo Comunale, and that of the bishop. The neighbour- hood produces exquisite wine, oil, and fruit, and cattle are reared on the pasture grounds. Pop. 4400.

SAN SEVERO, a city of Southern Italy, province of Foggia, with 18,000 inhabitants, stands in a delightful and fertile open country, producing abundance of grain, tobacco, and wine, and afford- ing rich pasturage. It was once remarkable for the industry and activity of its population. In 1799, it was taken, and nearly destroyed by the French. The cholera committed fearful ravages here in 1865.

SANTA ANNA, DON ANTONIO LOPEZ DE, ex-president of Mexico, was born in Jalapa, in 1798. While a mere youth, he entered the Spanish army, and became lieutenant-colonel in 1821. When Mexico determined to throw off the Spanish yoke, S. A. greatly distinguished himself at the head of the Mexican troops. The Spanish royalists were expelled from Vera Cruz, and he was elected governor of the city and province. Iturbide had established an imperial rule over Mexico (q. v.), but his tyranny having worked his downfall, S. A. pro- claimed, in 1822, a Mexican republic, which was recognised by every foreign state except Spain. He was incessantly engaged in quelling the civil wars kindled by the aristocratic and democratic factions. In 1829, he engaged and put to flight a division of Spanish troops which invaded Mexico by way of Tampico, with the view of again bringing Mexico under Spanish rule. The separation of Texas (q. v.) from the Mexican union was vigorously but

unavailingly opposed by Santa Anna. In 1837, differences arose with France, and a division of French troops landed at Vera Cruz. They were gallantly engaged by S. A., who drove a portion of them into the sea at the point of the bayonet. In this action he received a bullet in the leg, which rendered the amputation of the limb necessary. In 1838, the French took Vera Cruz, and obtained the settlement of their differences. In 1847, war having been declared by Mexico against the United States, S. A. took the command of the Mexican forces. He offered a gallant but ineffectual resistance to the troops of Generals Scott and Taylor. The city of Mexico having been stormed and taken by the Americans under General Scott, the war was at an end, and S. A. retired from Mexico. During 30 years he had disputed the direction of affairs with Bustamante, Herrera, Cevallos, and other chiefs of parties, being at one time dictator, and at another disgraced and an exile. In 1853, Mexico, torn by civil dissensions, and falling into anarchy, again recalled Santa Anna. He declared himself president for life, and a civil war was the immediate result. In 1855, he was driven from the country. During the government of Juarez, 1858—1863, S. A. was looked up to as their chief and future ruler by an influential party in Mexico. On the establishment of a hereditary monarchy under Maximilian of Austria as emperor, S. A. returned to Mexico, having first signed an act of adhesion to the empire. He soon, however, began to intrigue for his own return to power, issuing addresses to the people as emperor, and was ordered to leave the country. After some residence in the United States, S. A. planned an expedition against Juarez; but ere a landing at Vera Cruz had been effected, S. A., with his secretary, was taken prisoner. He was condemned to death, but pardoned by Juarez, on condition of his leaving Mexico. He has since resided on Staten Island, New York, where he spends his time cock-fighting and playing at three-card monte. He was regarded by his countrymen as their ablest general, and although he was chargeable with unjustifiable cruelties in suppressing some insurrections, he was more successful than any other Mexican ruler in quelling the civil wars that have brought the country to its present miserable situation. He has also been accused of being greedy of wealth, and unscrupulous in the means of obtaining it. He has received the Grand Cross of Charles III. of Spain, and the Grand Cross of the Red Eagle of Prussia.

SANTA CRUZ (Teneriffe), the capital of the Canary Islands (q. v.), and the chief seaport of the group, stands on the north-east side of the island of Teneriffe. Its port, the safest in Canaria, has recently been extended and improved by the construction of two moles, with a united length of about 5400 feet, which enclose a large space of water, affording excellent anchorage in from two to nine fathoms. When completed, these works will be of inestimable value, in a commercial point of view, to the island. The streets of S. C. are broad, the houses whitewashed and flat-roofed, and several of the public buildings striking in appearance. The town is defended by several forts and redoubts. Formerly, large quantities of wine of excellent quality were grown in Teneriffe, and shipped for export at S. C.; now, however, the principal article of export from this, and also from the other islands, is cochineal. Coals from England, together with manufactured goods, hardware, and furniture are imported. Of the imports at S. C., more than a third come from England, and the annual imports amount to about £160,000. Pop. 13,228.

SANTA CRUZ. See VIRGIN ISLANDS.

SANTA CRUZ DE LA PALMA, the capital of Palma, one of the Canary Islands (q. v.). It stands on the east coast of Palma, on a spacious bay, 7 to 10 fathoms deep. Pop. about 5000, employed partly in manufactures of silks and hosiery.

SANTA FÉ, city and capital of the territory of New Mexico, U.S., built among the Rocky Mountains, on a plain 7047 feet above the sea. It is an old Spanish Mexican town, and contains two Roman Catholic churches and the government buildings. It has an active overland trade with St. Louis. Pop. in 1870, 4765.

SANTALACEÆ, a natural order of exogenous plants, mostly trees and shrubs. The leaves are undivided, sometimes minute. The perianth superior, 4—5-cleft. The stamens are 4 or 5, opposite the segments of the perianth, and inserted into the bases. The ovary is 1-celled, with 1—4 ovules. The fruit is 1-seeded, nut-like, or drupaceous.—There are about 110 known species, natives of various parts of the world, the European and most of the North American species being obscure weeds, while the trees of the order occur chiefly in the East Indies, New Holland, and the South Sea Islands. *SANTAL* (q. v.) is the produce of plants of this order. The leaves of *Osyris Nepalensis* are used in medicine. Some species are used in medicine in their native countries. *Fucus acuminatus* is the Queen of Nut of New Holland. Its taste and quality resemble those of Sweet Almonds, as do also those of the seed of the *Cervantesia tomentosa* of India. *Pyralia oleifera*, the Buffalo Tree or Oil Nut, has a large seed, from which, in the Southern States of America, oil is obtained.

SA'NTALIN, or **SANTALIC ACID**, the coloring matter of *Pterocarpus santalinus*, or red sandal-wood, is readily obtained by digesting the sandal-wood in alcohol, and then precipitating the santalin by the free addition of water. It is not used in this country as a dye-stuff, but is employed in India both in dyeing silk and cotton. It is in consequence of the santalin contained in the red sandal-wood is retained in the Pharmacopoeia as a colouring agent for tinctures, &c.

SANTA MARGHERITA DI BELICE, a town of Sicily, in the province of Girgenti, with 10 inhabitants. From the lands belonging to it, wine, and oil are exported. Woven goods and other manufactures for export.

SANTA MARGHERITA DI RAPALLO, a commune of the province of Genoa, department of Rapallo, situated on the sea-coast. Pop. 1000. It has a garrisoned castle close to the sea. The fishing men go to fish for coral on the shores of Sardinia and Africa. Consuls from Turkey, Egypt, and Tripoli reside here.

SANTA MARIA DI CAPUA-VETERE, a city of Southern Italy, in the province of Capua, with about 19,023 inhabitants. It is not very old, some but new, and its population increases every year. The neighbouring soil is very fertile, and produces abundance of grain, fruits, oil, and excellent wines. Its manufactures consist of cloth, and other woven materials and hats.

SANTA MAURA, or **LEUCADIA** (q. v.), one of the Ionian Islands, off the west coast of the ancient Greek province of Acarnania, from which it is now separated by a passage about a mile wide, although it was in early times connected with the mainland by an isthmus. The canal across the isthmus, which converted the peninsula of S. M. into an island, is said to have been cut by the Corinthians. S. M. is about 22 miles long, and has a tree-

ing from 6 to 9 miles. Area about 180 sq. m.; op. 20,147. Its surface is very uneven. It is traversed by a range of hills from north to south, high end at the southern extremity in the high hite cliffs called by the Italian sailors of the evant Cape Ducato (a corruption of *Leucates*), but etter known under the name of 'Sappho's Leap.'

SANTA'NDER, an important and thriving seaport of Spain, in the modern province of the same name, stands on a magnificent bay, an inlet of the ay of Biscay, about equally distant from Oviedo to the west, and San Sebastian on the east. The ay on which the town is placed is from two to uree miles wide, and about four miles long, and is vesmible to the largest vessels at all times of the de. The situation of the town, on a headland pected by a hill, is picturesque; among its edifices w are either interesting from their appearance, w important from their character. Of its former events one now serves as a theatre; another as cigar-factory, giving employment to about 1000 uple. Numerous new houses, and handsome rehousas, and commercial establishments of ous kinds have been erected recently. The fine sbour of S., with a commodious entrance, is acsible at all tides, and unobstructed by a bar. veral important improvements have recently taken ce here. The half of the province of S. may be id to be impregnated with iron, copper, zinc, and her ores; though, hitherto, the timidity of native pitalists has rendered the quantity extracted com-utatively small. In one year, 12,625 tons of iron id copper ores, together with a quantity of quick-ter and cobalt, were shipped from the port of S. Great Britain alone, and mostly to Newport and ransae. Wheat is an important element in the trade Santander. The annual exports amount to about 1,500,000; and of that sum the exports of wheat d flour alone amount to the value of £1,400,000. se imports—the chief articles of which are sugar se Cuba; textile fabrics from England, France, gium, and Germany; and salted cod-fish from rway—amount to about £1,800,000. A railway as south from S. to Venta de Banos on the eat North of Spain Railway; and in the middle rison of it, from Barcena to Reynosa, a distance 21 miles, there are 22 tunnels. Pop. (1870) 8,000.

SANTARE'M, an interesting old town and river-rt of Portugal, on the right bank of the Tagus, miles north-east of Lisbon by railway. It carries an active trade in the products of the fertile inity with Lisbon, with which there is steam-unication by river as well as by rail. Pop. out 8000.

SANTEE', a river of South Carolina, U.S., which es in the Blue Ridge, in North Carolina, by two nicipal branches, the Congaree and Wateree, and wing south-east, empties into the Atlantic Ocean. t. 33° 6'. It is navigable 150 miles to Camden, d is bordered, in its lower course, by rice-swamps d pitch-pine forests.

SANTERRE, ANTOINE JOSEPH, a French revolu-onist, who for some time exercised an influence ie disproportioned to his feeble abilities, was re at Paris, 16th March 1752. He followed the dn of a brewer in the Faubourg Saint-Antoine, d his wealth, probity, and generosity towards his plnyes gave him an immense influence in the trict. On the establishment of the National ard in 1789, he received the command of a bat-ion, and took part in the storming of the Bastile. ring the year 1792, the Jacobin agitators of the bourgs often met in the brewery of S., and it s there that the *émeute* of the 20th June was

preconcerted, on which occasion S., along with Saint-Huruge, marched at the head of the mob who invaded the Assemblée Nationale, and turned out the Girondists. He also played a conspicuous part on the 10th of August, when he was invested with the dignity of general-commanding of the National Guard. In October he was named Field-marshal (*Maréchal de Camp*), and in April 1793 he got the 'authorities' to let him off scot-free for a debt of some 50,000 livres, which he owed the exchequer in the shape of taxes on the beer manufactured by him—the minister of finance arguing that, inasmuch as S.'s beer was drunk for the most part by 'patriots' (not always careful to pay their score), it ought not to be subjected to 'duty.' But greater things were yet in store for the privileged brewer. On the 30th of July, he was appointed a general of division in the French army, and wishing to do something to justify this strictly military office, he marched at the head of 20,000 men against the Vendéan royalists, but was miserably beaten, and in consequence recalled. Shortly after, he was arrested and imprisoned, and only obtained his liberty after the death of Robespierre. He then withdrew into private life; but his fortunes and his popularity alike declined, and in 1800 we find him begging money and employment from Bonaparte. The latter, who saw clearly enough that S. was intrinsically an incapable fool, declined to employ him, but restored him to his military rank. S. died 6th February 1809. Owing to the calumnies of royalist writers, S. commonly figures as one of the ferocious monsters of the Revolution. There is positively no evidence, however, for such an opinion. Though he was hugely fond of 'brave words,' and menaced his opponents with all the bellicose grandiloquence of a French revolutionist, he was nearly as soft in the heart as in the head. Some witty contemporary made the following epitaph on him:

Ci-gît le général Santerre,
Qui n'eut de Mars que la bière.

SANTIAGO, the largest of the Cape Verd Islands (q. v.).

SANTIAGO DE CHI'LI, capital of the republic of Chili, and of a province of the same name, an archbishop's see, and the seat of the supreme government, stands at the western base of the Andes, 1800 feet above sea-level, and 90 miles east-south-east of Valparaíso. It was founded in 1541 by Pedro de Valdivia, but it has only recently acquired importance. Its climate is delightful; the plain on which it stands is extensive, and fertile in vines, figs, melons, and other fruits, and the scenery, looking towards the range of the Andes, is of the grandest description. The valley or plain of S. is sprinkled with tasteful villas and well-cultivated farms. The city is arranged in squares, and the houses are generally low, and are built around a court or garden, which is intended as a place of refuge during the earthquakes that frequently occur here. But of late years it has become the fashion, in spite of the earthquakes, to build costly houses of two, three, and even four stories, with a façade towards the street. The Alameda, shaded with poplars, and cooled by two streams of running water, is a pleasant promenade. The Mint, a portion of which serves as one of the president's palaces, and as offices for the ministers, is the handsomest of the public buildings, many of which, however, are beautiful structures. The university comprises the five faculties of philosophy, mathematics and physical sciences, medicine, law, and theology. There are important educational institutions (including a normal school), and a library

and museum. On the west side of the great square, which is adorned with a fine fountain, is the cathedral. On December 8, 1863, one of its churches, that of La Compania, was destroyed by fire during service, and 2000 out of the 3000 of the congregation—the victims being mostly women—met a dreadful death. Gold, silver, and lead are exported, and the imports are chiefly manufactured goods, wines, and spirits. The chief trade is with Valparaiso by the Valparaiso and Santiago Railway, which was opened in September 1863. Pop. 115,377.

SANTIAGO DE COMPOSTELLA, an important and once famous city of Spain, formerly the capital of Galicia, and, from the number of pilgrims by whom it was annually visited, the Mecca of Spain, is extremely picturesque in appearance, from its hill-girt situation on an irregular uneven site, 40 miles south of Coruña. The cathedral, occupying the site of a former edifice of the same nature, was founded in 1082, and its buildings, comprising a cloister, the archbishop's palace, &c., cover more than three and a half acres. The great square is a spacious area, and occasionally used as a bull arena. In front of the town-house is an equestrian statue of Sant Jago (St James the Elder, the patron saint of the city and of Spain), whose body, according to a monkish legend, was discovered near this by a hermit—a star miraculously pointing out the spot, whence the name Compostella (*campus stellæ*, 'field of a star'). It was removed to Santiago in 829. The bones of the saint are believed by the people to be built into the foundations of the cathedral. A desolate appearance is imparted to the town from the number of tenanted and ruined nunneries and convents which it contains. Leather is manufactured, and the making and carving of small silver graven images employ a number of silversmiths. Pop. about 30,000.

SANTIAGO DE CUBA, formerly the capital of the island of Cuba, and now the chief town of the eastern department of the island, stands on a bay on the south coast at the mouth of a stream of the same name. It is hemmed in by mountains, and is reputed the most unhealthy place in the island. Its harbour is deep, well protected, and fortified. It communicates by railway and telegraph with the other towns of the island. As a seat of commerce, it takes rank after Havana and Matanzas. Pop. 28,000.

SANTONIN ($C_{10}H_{16}O_6$) is a vegetable principle possessing slightly acid properties, obtained from the seeds and flower-heads of several species of *Artemisia*. The British Pharmacopœia gives *Santonica*, 'the unexpanded flower-heads of an undetermined species of *artemisia*, imported from Russia, as its source. It is one of the most efficacious of the class of medicines known as anthelmintics or vermifuges, the most obstinate cases of ascariides and lumbrici almost always yielding to its prolonged use. Pure santonin may be given in powder combined with scammony or rhubarb, the dose being from half a grain to two grains, according to the age of the child. The French prescribe it in the form of lozenges made with white sugar and mucilage; they are readily obtained in this country, and usually act satisfactorily. Küchenmeister, one of the highest authorities on the subject of intestinal worms, prefers the use of santonate of soda, which he obtains by digesting an alcoholic solution of santonin with carbonate of soda, evaporating and crystallizing. The dose is from two to eight grains mixed with sugar. Two very peculiar symptoms occur after the administration of santonin. The urine often acquires a reddish tint, which may give rise to an

unfounded suspicion of the presence of blood in that fluid; and under its influence, vision becomes remarkably affected for a few hours, every object appearing either yellow or green to the patient. No satisfactory explanation of the latter phenomenon has yet been given.

SANTOS, one of the chief ports of the province of São Paulo (q. v.) in Brazil, 34 miles south-east of the city of São Paulo, of which it is a port. It stands on the northern side of the lake of Engua Guaçu, and commands a fine bay. Sugar coffee, and other products of the interior are transported to S. by troops of mules; and salt, &c. and other imported goods find their way back by the same means. It is stated that 200,000 mules arrive here laden during the year. 160,000 sacks of coffee are exported annually. Pop. stated at 9000.

SAN VICENTI. See **SAN SALVADOR**.

SÃO FRANCISCO, a large river of Brazil rises as the Parapoeba, in the province of Minas Gerais, in lat. about $20^{\circ} 40' S$; long. $43^{\circ} 25' W$. It flows north, north-east, and east, and in its lower course it separates the provinces of Bahia and Sergipe from Pernambuco and Alagoas. Its first considerable affluent is the Rio das Velhas, which joins it on the right in lat. $17^{\circ} 45' S$. Above the junction of the Velhas, at Pirapora, where the river is 150 feet broad, and 1700 feet above sea-level, there is a fall of 17 feet. From the mouth of the Velhas (1666 feet above sea-level) to the falls of Pico Affonso, the river is navigable for 920 miles; and from these falls to the mouth of the river, a distance of about 140 miles, it is navigable for larger vessels and steamers. Its entire length is 1652 miles, and its breadth at its mouth is 3486 feet.

SAÔNE, a river of France, an affluent of the Rhone (q. v.), rises in the dep. of Vosges at Tilménil, in the Faucelles Mountains, at the height of 1476 feet above sea-level, and flows south past Gray, Châlons, and Mâcon to its confluence with the Rhone at Lyon. Entire length, 312 miles, of which 100 miles are navigable.

SAÔNE-ET-LOIRE, a dep. of France, bounded on the E. by the dep. of Jura and the river Saône, and on the W. by the dep. of Nièvre and the Loire. Area, 3303 sq. m.; pop. (1872) 594,354. The country consists for the most part of vast fertile plains, separated by rich vine-clad hills. Fertility is greatest in the vicinity of the two main streams. Horses of a small but vigorous breed are reared; the excellent and abundant pasture supports numerous herds. The wines, of which 15,400,000 gallons are made annually, are well known as *vins de Mâcon*. Agriculture, iron-mines, and manufactures of cotton fabrics, leather, paper, fire-arms, &c., are all actively carried on. The dep. was formed in 1790 out of four districts of the ancient province of Burgundy—Mâconnais, Charolais, Chalonnais, and L'Autunois. It now has five arrondissements, of which Mâcon is the capital.

SAÔNE, HAUTE, a dep. in the north-east of France, bounded on the N. by the dep. of Vosges and on the E. by that of Haut-Rhin. Area, 598 sq. m.; pop. (1872) 303,088. About one half of the entire area is in cultivable land, and more than a fourth part, comprising the north and north-east districts, is covered with forest-clad mountains. In the south and south-west, are fertile plains bounded by hills, covered with vines or timber. The climate of this rich champagne district, with its bulwark of mountains against the north and north-east winds, is remarkably mild and healthy. Sheep, including some flocks of the merino breed, and cattle are reared in large numbers. *Fruit* are

ely cultivated; and 6,600,000 gallons of wine d 220,000 gallons of brandy are made annually. The arrondissements are Gray, Lure, and Vesoul, d Vesoul is the capital.

SÃO PAULO, a southern maritime province of azil, bounded on the N. by the province of nas Geraes. Area, 169,060 sq. m.; pop. (1867) 1,000. Its coast-line—part of which in the north—is high and rocky, though the rest is low—is ut 400 miles in length. Sugar, coffee, rice, let, and tobacco are staple crops; horses, cattle, l swine are reared for export; and among the merals are the precious metals and gems. There several commodious harbours, and the capital is Paulo.

SÃO PAULO, a city of Brazil, capital of the vince of the same name, stands on an uneven elion between two small streams, tributaries of the e, 220 miles west-south-west of Rio de Janeiro. re is an Academy of Laws, attended by about legal students. The general appearance of the n is picturesque, and the vicinity and suburbs beautiful. Pop. stated at 22,032.

SÃO PEDRO DO RIO GRANDE. See RIO ANDE DO SUL.

SAP, the fluid which circulates in plants, and is indispensable to vegetable life, as the blood to al life. Entering by the roots of the plant (EXOSMOSE), it ascends through the cells and els of the stem, proceeding to the surface of the es and utmost extremities of the system, and ing been exposed, chiefly in the leaves, to the ences of air and light, returns through the bark, orion ultimately reaching the root and being eted there, whilst another portion probably as again into circulation with the new fluid ring from the soil. See CIRCULATION OF SAP. In its most simple state, the ascending or crude, consists chiefly of water, mucilage, and sugar; elaborated sap varies much more in its properties ifferent plants, forming the peculiar juices of plants. The elaborated sap always contains a less water than the ascending sap. Plants a to derive their supply of sap not only from oil by their roots, but also from the atmo-re by the Stomata (q. v.) of their bark and leaves; some, especially succulent plants, are capable xisting and increasing in size although entirely red from the soil. The ascending sap appears ad its way through the whole wood of the stem gneous plants, but chiefly through the alburnum ap-wood. The elaborated sap has been named ex (q. v.).—The ascent of the sap is one of the t wonderful phenomena of spring, and seems to ad not so much on the state of the weather, for eguns in the depth of winter, as on the plant ag had its sufficient period of repose, and being ore constrained by its very nature to renewed rity.

AP, in Military Engineering, is a narrow ditch rench, by which approach is made from the most parallel towards the glacis or covert-way of sieged place. The sap is usually made by four en, the leading man of whom rolls a large on before him, and excavates as he progresses, g smaller gabions with the earth dug out, and ing them on one or both sides to form a para-

The other sappers widen and deepen the sap, wing more earth on to the parapet. A sap is idered to advance in average ground about t feet per hour. From the nearness of the y's works, running a sap is an extremely gross operation. When possible, therefore, it ried on at night; in any case, the sappers are

relieved at least every hour. When a sap is enlarged to the dimensions of a trench, it bears that name.

SATAJOU, a name sometimes applied to all that division of American monkeys which have a prehensile tail, and sometimes limited to those of them which are of a slender form, as the genera *Ateles* (q. v.), *Cebus* (q. v.), &c.

SAPINDACEÆ, a natural order of exogenous plants, consisting of trees and twining shrubs furnished with tendrils, and a few herbaceous climbers. Their leaves are often marked with lines or pellucid dots. The flowers are in racemes or racemose panicles, hermaphrodite or unisexual. The calyx is 4—5-partite, or consists of 4—5 sepals. The petals are 4—5, occasionally wanting, hypogynous, usually having an appendage in the inside. The stamens are usually 8—10; often inserted into the disc, which is fleshy, and sometimes glandular. The ovary is generally 3-celled, the cells containing one or few ovules. The fruit is fleshy, or samaroid, or capsular. The order contains about 380 known species, natives of warm climates, especially of South America and India; none of them natives of Europe, although the HORSE-CHESTNUT (q. v.) is now as well known in many parts of it as most of its native trees.—The timber of some species is valuable, particularly that of *Pterocylon utile* and *Hippobroma alatum*, natives of the Cape of Good Hope, the former known there by the name of *Nieshout*, and the latter of *Pardepie*. Some are used in medicine as astringents. Narcotic and poisonous properties are very generally developed—also a saponaceous principle, especially in the genus *Sapindus* (see SOAP BERRY). Yet GUARANA BREAD (q. v.) is made from the seeds of a species of this order; the leaves of another (*Cardiospermum halicacabum*) are used as a boiled vegetable in the Moluccas; and the fruits of some species are excellent.

SAPODILLA PLUM, the name given in the West Indies to the fruit of *Achras Sapota* and other species of *Achras*, a genus of the natural order Sapotaceæ. The seeds are aperient and diuretic, but an overdose is dangerous. The pulp of the fruit is subacid and sweet, and it is much esteemed for the dessert in the West Indies. The fruit of *Achras mammosa* is called MARMALADE. The NASKERRY, also of the West Indies, belongs to this genus.

SAPONIFICATION. See OILS AND FATS, and SOAP-MAKING.

SAPONIN (C₂₆H₄₀O₁₄) is a vegetable principle contained in various plants, including the *Saponaria officinalis*, or Soap-wort, the *Polygala Senega*, several varieties of *Lychnis*, the fruit of the horse-chestnut, &c. It is readily extracted from the root of soap-wort by means of boiling alcohol, which, as it cools, deposits the saponin as an amorphous sediment. It derives its name from its behaviour with water, in which it is soluble in all proportions, yielding an opalescent fluid which froths when shaken, like a solution of soap, if even 1/100th part of saponin be present. Its solution, or an infusion of soap-wort, is sometimes employed in place of a solution of an alkaline soap, for cleansing the finer varieties of wool from grease.

SAPOTACEÆ, a natural order of exogenous plants, consisting of trees and shrubs, often abounding in milky juice. The leaves are leathery, entire, and without stipules. The flowers are axillary; the calyx regular, persistent, generally with five divisions; the corolla monopetalous, hypogynous, deciduous, regular, its segments usually equal in number to those of the calyx, rarely twice or thrice

as many. The stamens are inserted on the corolla, fertile ones generally as many as the segments of the calyx, and generally with alternate sterile ones. There is no disc. The ovary is superior, with several cells, each cell with one ovule. The fruit is fleshy; the seeds nut-like, sometimes cohering; the testa bony and shining, with a very long, opaque, and softer scar on the inner face.—There are considerably more than two hundred known species, chiefly natives of the tropics, and the remainder of sub-tropical countries. One of the most recently discovered species is also already one of the most important, *Isanandra gutta*, which produces GUTTA PERCHA (q. v.).—The fruits of some are pleasant, as the SAPODILLA (q. v.), and other species of the genus *Achras*, the STAR APPLE, and other species of *Chrysophyllum* (q. v.), different species of *Mimusops*; *Imbricaria Malabarica* and *I. maxima*, various species of *Lucuma*, &c. The genus *BASSIA* (q. v.) contains species valuable for the oils which they yield. The seeds of *Mimusops elengi* also yield oil abundantly.

SAPPAN WOOD, SAPAN WOOD, or BUK-KUM WOOD, the wood of *Casalpinia Sappan* (see CASALPINIA), an East Indian tree, about forty feet high, with twice pinnate leaves, and racemes of yellow flowers. The wood is much used as a dye-wood, yielding a good red colour, which, however, is not easily fixed. It is a very considerable article of export from Singapore and other ports of that region both to Calcutta and to Europe.

SAPPER, the name given to a private soldier in the corps of Royal Engineers.—The name of the corps was formerly Royal Sappers and Miners.—The pay of a sapper is £20, 10s. 7½d. a year, with extra pay when at work; the number of such men for 1873–1874 is 3204. Only men of good character, already adepts in a mechanical trade, are eligible for this service, which is very popular, as an intelligent sapper frequently passes into some situation in civil life for which his practical military training specially fits him. Many sappers are excellent surveyors, photographers, and draughtsmen.

SAPPHIRE, a gem excelled in value by no precious stone except diamond, and regarded as a variety of Corundum (q. v.), highly transparent and brilliant. It is sometimes colourless, and the colourless kind, called *White S.*, is sometimes sold as diamond. It more frequently exhibits exquisite colour, generally a bright red or a beautiful blue; more rarely, gray, white, or green. The red variety is the Oriental Ruby (q. v.) of lapidaries; the blue is that commonly called S., and which has received this name from ancient times. It is found crystallised, usually in six-sided prisms, terminated by six-sided pyramids; and is sometimes found imbedded in gneiss; but it more frequently occurs in alluvial soils. It occurs at Bilin in Bohemia, and Expailly in Auvergne, but more abundantly in some parts of the East. Ceylon is famous both for its rubies and its sapphires, the latter being the more abundant. They occur with garnets and other minerals, in a stratum of water-worn pebbles firmly imbedded in clay, in which there are occasional lumps of granite and gneiss. But nothing has yet been done to seek for them in their original situation in the mountain rocks. A piece of S., which was dug out of the alluvium within a few miles of Ratnapoora in 1853, was valued at upwards of £4000. The S. was one of the stones in the breastplate of the Jewish high-priest. Among the Greeks, it was sacred to Jupiter.—The name *Girasol S.* is given to a beautiful variety with a pinkish or bluish opalescence, and a peculiar play of light. The *Chatoyant S.* has more pearly reflections. The *Asteria S.* has in the

midst of it a star of six bright rays, resulting from its crystalline structure.

SAPPHO, along with Alcæus, the chief representative of the Æolian school of lyric poetry, was born either at Mitylene or at Eresos in Lesbos. She was only six years old when she lost her father Scamandronymus. She was contemporary with Alcæus, Stesichorus, and Pittacus, with the first of whom she lived in friendly intercourse, as is seen in the surviving lyrics of both. All that we know of her is contained in an obscure reference in the *Panegyric of Marcellus*, and in one of the epistles of Ovid, to her having fled from Mitylene to some place of refuge in Sicily, between 604 and 592. Her famous plunge into the sea from the Leucadian rock, on finding her love for Phaon unrequited, seems to be an invention of later times. At Mitylene, she is supposed to have been the centre of a literary coterie, all of them females, and most of them pupils of her own in the art of poetry. Her moral character has been the subject of controversy in modern times, the most recent disputants being the late Col. Mure and the well-known F. G. Welcker. Bonn, who, in the *Rheinisches Museum* (1857–1858), appeared, the former, for the prosecution, and the latter for the defence. To whose opinion on this subject we may incline, there is no doubt of her high lyrical genius, which was an admiration of antiquity from Solon downwards, and which, as still surviving in her matchless ode to Aphrodite, enhances our regret that of the books of her poems, we only possess fragments. The best text is that contained in Bergk's *Poetae Lyrici Graeci* (1854); the best separate edition is Neue's (1827).

SAPUCAIA NUT, the seed of *Lecythis*, a lofty tree, which is plentiful in the forests of the north of Brazil, and belongs to the natural order *Lecythidaceae*. The fruit is urn-shaped, as large as a child's head, and opens by a lid which falls off. Each fruit contains a number of seeds or nuts, as in the case of the allied Brazil nut. The flavour is finer than that of the Brazil nut, although, like the S. N. is much less common in our shops. Its form is oval, somewhat pointed at both ends, and are slightly bent in opposite directions. Monks are very fond of the S. N., and are sometimes caught in consequence of thrusting the hand into a caper, and not being able to withdraw it when filled with a nut, whilst they obstinately keep hold of the expected prize.

SARABANDE, originally a slow dance, said to be of Saracenic origin; and hence a short piece of music, of deliberate character, and with a peculiar rhythm, in 3 time, the accent being placed on the second crotchet of each measure. The sarabande is of frequent occurrence among the *suiter* or *serenade* short pieces written by Handel, Sebastian Bach, and others of the old masters, for the harpsichord or clavicord.

SARACENIC ARCHITECTURE See ARABIAN ARCHITECTURE.

SARACENS, a name variously employed by mediæval writers to designate the Mohammedans of Syria and Palestine, the Arabs generally, or the Arab-Berber races of Northern Africa, who conquered Spain and Sicily, and invaded France. At a later date, it was employed as a synonym for all infidel nations against which crusades were preached, and was thus applied to the Seljuks of Iconium, the Turks, and even to the pagan Prussians. The true derivation of the word was long a puzzle to philologists; Du Cange deduced it from Sarah, the wife of Abraham, an opinion coincided in by the mediæval Christian authors; Hottinger (*Bibl. Orient.*) from

SARACEN'S HEAD—SARAWAK.

be Arab. *saraca*, to steal; Forster (*Journey*), from *ahra*, a desert; while others strove to see its origin in the Hebrew *sarak*, poor; but the opinion which has been most generally supported, and prevails at the present time, is, that the word was originally *'sharbyn'* (Arab. 'eastern people'), corrupted by the Greeks into *Sarakanoi*, from which the Romans derived their word *Saraceni*. The epithet *sarakanoi* was applied by the Greek writers from the 1st c. of the Christian era) to some tribes of Bedouin Arabs in Eastern Arabia, though they do not agree among themselves as to the particular tribe so denominated. Pliny and Ptolemy place the S. in Arabia Petraea and Mesopotamia, on the common frontier of the Roman and Persian empires; and the description of them by the latter, a most painstaking and accurate historian, coincides, in every important particular, with what is known at the present day of the Bedouin tribes of those regions.

SARACEN'S HEAD, a not unfrequent bearing in Heraldry. It is represented as the head of an old man, with a savage countenance.

SARAGO'SSA. See SUPPLEMENT.

SARASWATĪ is, in Hindu Mythology, the name of the wife, or the female energy, of the god Brahma, the first of the Hindu Trimūrti or triad. She is also the goddess of speech and eloquence, the patroness of music and the arts, and the inventress of the Sanscrit language and the Devanagari letters. She was induced to bestow these benefits on the human race by the sage Bharata, who, through his piety, caused her to descend from heaven, and to divulge her inventions. Hence she is also called *Mātā*. She was very white, hence another of her names, *Mahāśvētā*, or *Mahāśuklā* (from *mahat*, great, and *śvētā* or *śukla*, white).—S. is also the usual name of the river now called *Sarasooty*, which rises in the mountains bounding the north-west part of Delhi, whence it runs in a south-westerly direction, and is lost in the sands of the great desert of the country of the Bhatti. According to the Hindus, the river only disappears in this place, and continuing its course underground, joins the Ganges at Jumna at Allahabad.

SARATOGA SPRINGS, one of the chief watering-places in the U.S., is in New York, 38 miles N.W. of Albany. It contains 23 mineral springs, some chalybeate; some containing iodine, with salts of soda and magnesia; and all highly charged with carbonic acid. They are prescribed in diseases of the liver, chronic dyspepsia, &c. In the village are 2 hotels, some of immense magnitude; and during the season, there are from 25,000 to 35,000 visitors. Pop. in 1870, 7516.

SARATOV, a government in the south-east of Russia, is bounded on the E. by the river Volga, and on the N. by the governments of Penza and Simbirsk. Area, 31,213 sq. m.; pop. 1,725,478. Its dimensions were much larger prior to the year 1850, when a considerable portion of it—the portion to the east of the Volga—was taken to form a part of the government of Samara (q. v.), erected in that year. One-third of the area is pasture-land, $\frac{1}{4}$ th is under crop, $\frac{1}{12}$ th in wood, and $\frac{1}{12}$ th waste land. The chief rivers are the Volga and the Medwieditza. A number of German colonists settled here in 1765–1775, and distinguished themselves by their persevering industry and by diligent cultivation of the

soil. Their descendants have become an important section of the population. Cattle-breeding is carried on extensively; fishing is of considerable importance.

SARATOV, a city of Russia, capital of the government of the same name, on the right bank of the Volga, 460 miles south-east of Moscow. Though its houses are generally built of timber, the town has a rich and picturesque appearance. Its 16 churches are ornamented with numerous towers and cupolas; and its broad streets, from the character of the houses and of the elegant equipages that roll through them, have quite a European appearance. It manufactures pottery, bricks, tobacco, silk, hosiery, &c. Pop. 93,218.

SARAWAK, a kingdom on the north-west coast of Borneo, is bounded S. and W. by Sambas, E. by Brunai, and N. by the Bight of Datu. The coast stretches from the west of Cape Datu, in lat. 2° N., and long. 109° 55' E., to the east of the river Samarahan, in long. 111° 3' E., a distance of nearly 70 miles. Area, 3000 sq. m. Pop. 50,000. The Sarawak is the most important river; it has two navigable mouths, the one entering the Bight of Datu in lat. 1° 42' 30" N., and long. 110° 20' 30" E.; the other, a few miles further to the east. Other considerable rivers are the Rejang (navigable for 120 miles for vessels of more than 1000 tons), the Lündu, Samarahan, and Sadang. A chain of mountains, 3000 feet in height, rises in S., and, with increasing elevation, tends towards the north; while others are detached, as the Samarahans, and the steep, densely-wooded Lündu. Sandstone and granite are the prevailing rocks; porphyries, basalt, and quartzose schists also occurring. In some parts, the soil is clayey; in others, it is a rich mould. With the exception of some cultivated spots, the surface is covered with forests, which abound with wild swine, harts, and a variety of monkeys. There is excellent coal near the river Sadang. Antimony ore, which can be both easily worked and shipped, is obtainable in any quantity; copper and gold have been found, and iron ore is plentiful at Lündu. Fine timber trees, as ironwood, ebony, sandal-wood, teak, and other sorts peculiarly adapted for shipbuilding, grow on the lands near the mouths of the rivers. Overtopping them all is the tall Camphor Tree (*Dryobalanops aromatica*), from which, by incision, the valuable camphor-oil is obtained; or by felling and splitting the wood, the crystallised camphor, which is prized above that produced in any other part of Asia.

The climate is not considered unhealthy. Much rain falls from September to March, and the thermometer usually indicates about 83° F. Edible nests, wax, and aromatic woods are collected by the Dyaks for the Singapore market, and the plains are well adapted for the growth of rice and sago. In 1862, two cargoes of choice timber for shipbuilding were sent to the royal dockyards of Great Britain, and more attention is now being paid to that natural source of wealth. In 1871, the exports, the chief articles of which were gutta-percha, sago flour, antimony ore, and edible birds' nests, amounted to £280,000; and the imports, chiefly gray and coloured shirtings, tobacco, brass-ware, opium, rice, and cocoa-nut oil, amounted to £315,000. The exportation of antimony and sale of opium are monopolised by the government, and with a small head-tax, form the chief revenue.

The original inhabitants are Dyaks, divided into some 20 tribes, and speaking different languages; they are, for savages, mild, industrious. Malays live on the coast, and the interior is inhabited by Chinese. From 1841 to 1860,

* *Sharkyn*, or *Sharakynoun*, 'eastern people,' is thus opposed to *Magharib*, or *Magharib*, 'western people,' the self-styled appellation of the inhabitants of *Magharib* ('the west') or *Morocco*.

Sir James Brooke (q. v.), as an independent rajah appointed by the sultan of Borneo, in return for distinguished services in putting down rebellion and restoring order; and even on the testimony of the Dutch, who view with extreme jealousy the increased influence of the British on that coast, his rule has done much to promote the civilisation and prosperity of his people.

The seat of government is the town of Sarawak, formerly called Kútjing, near the mouth of the river, which is navigable for large ships. Mission-stations and schools have been erected, and the population has increased to 25,000. Trade, which has multiplied tenfold since Sir J. Brooke was appointed rajah, is principally carried on with Singapore.

SARCINA (Lat. a package), or **SARCINULA**, a genus of minute plants of very low organisation, sometimes reckoned among *Algae*, and sometimes among *Fungi*. A number of forms or species are known. The first discovered, called *S. ventriculi*,

Sarcina Ventriculi, magnified 1000 diameters.

(Copied from the *Micrographic Dictionary*. Lond., Van Voerst.)

was originally observed by Goodair in matters vomited from the human stomach. It is of a roundish quadrangular form, about $\frac{1}{16}$ th to $\frac{1}{8}$ th of a line in diameter; the individuals generally grouped in cubes of four, sixteen, or sixty-four in the cube, separated by rectangular striae. Although the most common seat of sarcinae is the human stomach, they have likewise been detected in the stomach of the tortoise, the rabbit, the dog, the ape, and in the cæcum of the fowl; in the urine, in a considerable number of cases; in the lungs; in the faeces and intestinal canal; in the fluid of the ventricles of the brain; in cholera stools; in the fluid of hydrocele; in the bones; and Dr Lowe has noticed its existence in stagnant water. It appears from the measurements of Welcher that the sarcinae occurring in urine are about half the size of those occurring in the stomach, and the aggregations of sarcina cells are also smaller.

The occurrence of the sarcina in the urine, the fluid of the ventricles of the brain, &c., is probably a *post-mortem* phenomenon of little diagnostic or pathological importance. Its appearance in vomited fluids is, however, characteristic of a peculiar and important form of dyspepsia. The vomited matter in these cases has a faint acid smell, like that of fermenting wort, and is obviously in a state of fermentation. After standing a few hours, it becomes covered with a thick, brownish, yeast-like froth, and deposits a brown flaky sediment. On examining the froth and the deposit under the microscope, sarcinae are found in great abundance, together with the torulae characteristic of Yeast (q. v.). The fluid is always acid, if sarcinae are present. The amount of vomited matter is always large, and sometimes enormous. It is usually ejected in the morning, after a night spent awake from a sense of heat, gurgling, and distention in the epigastric region; and its discharge gives almost immediate relief. Dr Budd, one of the highest authorities in diseases of the stomach, believes that the disease consists, primarily and essentially, in some organic change, which prevents that organ from completely emptying itself, and which causes a secretion from its coats, capable, when mixed with food, of undergoing or exciting a process of fermentation; and that the

development of the sarcinae bears to this process to some stage of it, the same relation which to development of torulae bears to simple alcoholic fermentation. The well-known power of sulphuric acid in checking the fermentative process, induced Professor Jenner to try the effect of sulphate of soda—a salt which readily yields its sulphuric acid—in this disease; and experience has fully confirmed the accuracy of Jenner's induction; the salt, administered soon after a meal, or when the fermenting process is commencing, in doses varying from 10 grains to a drachm, dissolved in water, is the most effectual remedy at present known for relieving this disorder. The hypophosphate of soda, in somewhat larger doses, has a similar action.

SARCINE (Gr. *sarz*, gen. *sarcos*, flesh) is the name now given to a nitrogenous substance ($C_{10}H_4N_2O_4$) which has been obtained from muscular tissue of the horse, ox, and hare; and from various glandular organs, as the liver and the spleen of the ox, the thymus gland of the calf, and the human liver, in cases of acute atrophy of that organ, in which case it is associated with xanthine ($C_{10}H_4N_2O_4$), a substance differing from it by two atoms of oxygen. It is identical with the substance formerly known as Hypoxanthine.

SARCOLEMMMA is the term applied to a delicate sheath which invests each primary muscular fibre. See **MUSCLE**.

SARCO'MA is a somewhat vague term used by Abernethy and many subsequent surgical writers to designate a fleshy or firm morbid tumour. The term sarcoma is comparatively rarely met with in recent works on surgery.

SARCO'PHAGI. See **CANNIBALISM**.

SARCO'PHAGUS (Gr. flesh-eater), any receptacle for a dead body. The name is applied in the property assigned to a species of stone at Assos in Troas and used in early times for consuming the whole body, with the exception of the teeth, within the space of forty days. The oldest known sarcophagi are those of Egypt, some of which are contemporary with the pyramids. The earliest of these are of a square or oblong form, and either plain, or ornamented with lotus leaves; the later are of the form of rectangular mummies, and bear inscriptions. The Persian and Persian kings were also buried in sarcophagi. The Roman sarcophagi of the earlier republican period were plain. Sarcophagi were occasionally used in the later republic, although burning became the more general mode of disposing of the dead. The use of stone chests for the interment of distinguished persons has not been altogether discontinued in modern times.

SARDANAPA'LUS. See **ASSTRIA**.

SARDE, or **SARDA**, a variety of quartz, deriving from carnelian only in its very deep red color, blood-red by transmitted light. It is now brought to a much higher price than common carnelian. The name is probably from Sardinia. The Sardians used the stones of the breastplate of the Jewish high priest. There were also two in the ephebe. **SARDONYX** is an Onyx (q. v.) containing layers of sard.

SARDÉS, or **SARDIS**, anciently a city of Lydia Minor, the capital of Lydia, was situated in a plain between the northern base of Mount Tmolus and the river Hermus, about 60 miles east of Smyrna. Through its *agora*, or market-place, flowed the Pactolus, a tributary of the Hermus. The city is first mentioned by *Æschylus*, who says it was taken by the Cimmerians, in the reign of

King Ardys (680—631 B.C.). In the reign of Croesus, the last Lydian king, S. attained its highest prosperity. It became the residence of the Persian satraps after the overthrow of the Lydian monarchy. The Athenians burned it 503 B.C., and it afterwards passed under the Romans, and was the seat of a separate provincial government. It is one of the Seven Churches mentioned in the Book of Revelation.—*Sart*, the modern Sardinia, is a poor village, worthy of mention only for the ruins of the ancient city to be seen in the vicinity. Of these, the chief are those of a stadium, of a theatre, and of the Acropolis.

SARDINE (*Clupea Sardina*), a fish of the same genus with the herring and pilchard, smaller than the pilchard; abundant in the Mediterranean, and found also in the Atlantic Ocean, although not so far north as the British shores. It is much esteemed for its flavour, and sardines preserved in oil are exported in large quantities from some of the Mediterranean ports. But the 'sardines' of the west coast of France, which are largely imported into Britain, are generally not true sardines, but young sprats—the *garvies* of the Firth of Forth—and sometimes young herring.

Sardines appear in shoals on the coasts of the Mediterranean at particular seasons, as herrings and pilchards on those of Britain. The S. fishery on the coast of Provence is chiefly in the months of May, June, and July; but the fishery for sprats, which are cured as sardines, and sold under that name on the coast of Bretagne and elsewhere in the west of France, takes place in the winter months. The quantity of both kinds cured is so great as to amount in value to 3,000,000 or 4,000,000 francs annually, about £120,000 to £160,000 sterling. They are exported to the most distant parts of the world; cured with oil in tin boxes, forming a much esteemed delicacy, and, at the same time, a most wholesome article of food. To cure them in this way, they are first carefully washed in the sea, then sprinkled with fine salt; and after a few hours, the head, gills, &c. are removed; they are then washed again, and spread out on willow branches or wire-work, exposed to the sun and wind, if the weather is dry, but in damp and rainy weather, to a current of air under cover. They are next put into boiling oil, in which they remain for a short time, and when they are taken out, the oil is drained away from them as much as possible, and they are put into the tin boxes, of which the shape and appearance are so familiar to everyone. The boxes being filled with sardines, are filled up with oil, the lid is soldered on, and they are placed for a short time in boiling-water, or exposed to hot steam. The boxes which have leaked or have burst in boiling are rejected, and those which remain sound are now ready for the market.

In the south of France, sardines are sometimes cured in red wine, and those so cured are called *Sardines Anchoises*, or Anchovied Sardines.

There seems to be no good reason why the sprats of the British coast should not be cured in oil, like those of the west coast of France, and so prove a new source of wealth, besides probably being brought at a lower price to the market, to the advantage of those for whom sardines are at present so expensive.

Several species of small *Clupeidae*, much resembling the S., are found in different parts of the world, and are used in the same way as the S. of the Mediterranean. One species frequents the southern and eastern coast of Ceylon in such vast shoals, that 400,000 have been taken at a single haul of her nets in a little bay; and when the shoal approached the shore, the broken water became as

smooth as if a sheet of ice had been floating below the surface.

SARDINIA, KINGDOM OF, a former kingdom of Italy, and the nucleus of the present Kingdom of Italy, included the duchies of Savoy and Genoa, and parts of those of Montserrat and Milan, the principality of Piedmont, the county of Nice, and the islands of Sardinia and Capraia, amounting in all to 19,564 English sq. m. of continental territory, with a pop. of (1857) 4,590,260, and 9205 of insular territory, with a pop. of 577,282; total area 28,769 English sq. m., pop. 5,167,542. In 1859, it was increased by the addition of the Austrian portion of the Milanese, and diminished by the cession in 1860 of Savoy and Nice to France, the change in the continental territory being shown by the following figures: area, 21,099 English sq. m.; pop. (1858) 6,530,232; the insular territory remaining unaltered. The various districts above mentioned differ greatly from each other in physical configuration and climate, and the more important of these are treated in separate articles. See also ITALY. The Roman Catholic religion was established by law in March 1848; but monastic orders, with the exception of those which are also benevolent institutions, were suppressed May 28, 1855. In 1859, the army amounted to 76,172 men, and the fleet to 29 ships (none of them men-of-war), with 436 guns; the revenue (1858), which was mostly derived from customs, duties, and direct taxation, to £5,799,301; and the expenditure to £5,949,902—a want of equilibrium in the finances which had long existed, and which caused the establishment, since 1819, of a gradually increasing national debt, that amounted (1858) to £27,080,810. The annual import trade amounted (1857) to a declared value of £19,123,054, and the exports to £14,605,043.

The kingdom of S. was originated by a treaty (24th August 1720) between Austria and the Duke of Savoy (q.v.), by which the latter agreed to surrender Sicily to the former on condition of receiving in exchange the island of Sardinia, and the erection of his states into a kingdom. In 1730, *Victor-Amadeus I.*, the last Duke of Savoy and first king of S., resigned the throne to his son, *Charles-Emmanuel I.* (1730—1773); but repenting his resolution, and attempting to resume the government, he was put in prison, where he died in 1732. His son, by joining with France and Spain against Austria, obtained (1735) the territories of Tortona and Novara, to which were further added (1743), during the war of the Austrian Succession, the county of Anghiera, and the territories of Vigevano and Pavia. He was the author of the code known as the *Corpus Carolinum*. His successor, *Victor-Amadeus II.* (1773—1796), acceded to the European coalition against France, and was deprived in consequence of Savoy and Nice in 1792; but sustained by England and the pope, he raised an army, and maintained himself in his kingdom till 1796, when Bonaparte forced him formally to relinquish the territories he had lost. His son, *Charles-Emmanuel II.* (1796—1802), was at first an ally of France; but the Directory, in 1798, compelled him to surrender all his continental possessions, which were then incorporated with France; and it was not till the first peace of Paris (May 30, 1814) that the House of Savoy regained its territories. The Congress of Vienna (December 1814) annexed to S. the ancient republic of Genoa, and the second peace of Paris (1815) restored a small portion of Savoy, which France still possessed, and gave the king a protectorate over the small principality of Monaco. Long before this time, *Charles-Emmanuel* had abdicated, and his brother, *Victor-Emmanuel I.* (1802—1821), succeeded to his rights, and made his entry into

SARDINIA.

Turin, 20th May 1814. His return restored the ancient misgovernment; and similar political changes in the other Italian states revived the societies of the 'Carbonari' (q. v.) and other similar secret associations, whose aims were supported by a portion of the nobility and army, and by the heir-presumptive to the throne, Charles-Albert, Prince of Savoy-Carignan. The insurrection of the army on the 9th and 10th of March 1821, brought on a general revolution. But the king having abdicated in favour of his brother, *Charles-Felix* (1821—1831), and the Austrians having come to the rescue, the insurrection was put down. Under the protection of an Austrian army of occupation till 1823, Charles-Felix re-established absolute power, recalled the Jesuits, persecuted the Protestants, and took various other measures for rooting out all opposition. On his death, the elder line of Savoy became extinct, and the succession fell to the cadet branch of Savoy-Carignan (see SAVOY, HOUSE OF), whose rights had been recognised by the Congress of Vienna, and *Charles-Albert* (q. v.) (1831—1849) ascended the throne. The liberals were gratified with some slight reforms, but the power of the clergy was untouched, and the conspiracy of 30th November 1833 at Turin, and the mad inroad of Mazzini, at the head of a small band of German, Polish, and Italian refugees, in February 1834, only disturbed the country, and confirmed the government in its despotic policy. The interior administration was, however, carried on with more energy than under the two previous reigns, through the conclusion of treaties with France, Britain, Turkey, the Low Countries, Denmark, Austria, and the Hanse Towns, &c.; the construction of roads, bridges, and railways was vigorously prosecuted, and agriculture and other industries were encouraged. In 1842, the king commenced a gradual but progressive liberal policy, promulgated a limited act of amnesty to political offenders, relaxed the severity of censorship, reformed judicial administration and prison discipline, and abolished the feudal system in Sardinia. The kingdom participated in the agitations of 1846 and 1847, which affected the whole peninsula, but was wholly exempt from insurrections and conspiracies, the people contenting themselves with expressing their views and wishes in petitions and demonstrations displaying entire confidence in the government. On February 8, 1848, the king announced a new and extremely liberal constitution, which was proclaimed some weeks afterwards; a liberal law of election was decreed, the first Sardinian parliament convoked for the 17th April, and the act of amnesty declared general. In the midst of these changes, the revolution broke out, and Charles-Albert, who was saluted with the title of 'the sword of Italy,' put himself at the head of the movement, and declared war against Austria. (See ITALY, RADETSKY, &c.) On the day after the fatal rout of Novara (13th March 1849), Charles-Albert abdicated, and was succeeded by his son, Victor-Emanuel (q. v.), who, in alliance with France, declared war against Austria in 1859; and by March 1861 was in possession of the whole of Italy, except Venetia and Rome, with the title King of Italy. Venetia was added to the kingdom in 1866, and the Papal States in 1870, when the union of Italy was complete.

SARDINIA, ISLAND OF, the largest, after Sicily, of the islands of the Mediterranean, lies directly south of Corsica, from which it is separated by the Strait of Bonifacio, a channel only 7 miles wide in its narrowest part. S. is situated about halfway between Central Italy and Africa, and between Southern Italy and Spain. Its length is 166 miles; greatest breadth 90 miles; and area 9205 sq. miles.

The country is mostly mountainous, some of the peaks of the central chain having an elevation of 6300 feet. The Limbara range, in the north-west, is granite, the diagonal chain paleozoic, and the central range of the tertiary calcareous formation; many of the peaks, especially within the semicircle formed by the Limbara range, are active volcanoes. The coasts are generally steep and rugged. A few islands lie off the coast, and all of any considerable size and importance, are situated at the corners; off the north-east corner are the Maddalena group, consisting of Maddalena, Capra, and five or six minute islets; off the north-west corner is Asinara; and off the south-west corner are San Pietro and San Antioco. The island is well supplied with streams, but none of them have a long course, and only one is partially navigable.

Soil and Climate.—Between the mountain ranges are several wide valleys of remarkable beauty and fertility. There are also several large sandy and stony districts (*macchie*), of almost irredeemable sterility. The mountain sides are partly rocky and barren, partly clad with woods, and partly fitted for pasture. The climate is mild, the temperature ranging from 34° to 90°; but in the low lands, which are largely of a marshy character, and in the neighbourhood of the littoral lakes, a deadly malarial (*intermperie*) prevails, especially in autumn. The inhabitants of those districts, who can afford to do so, migrate annually during the unhealthy season; and those who are compelled to remain never leave their houses till an hour after sunrise, and carefully return before sunset, taking all precautions to prevent the entrance of the poisonous gas by door or window. The inhaling of the miasma by a stranger is considered among the inhabitants to be as deadly as a dose of strong poison.

Products.—Wheat, barley, maize, oranges, and other fruits are produced in abundance, and are esteemed for their excellent quality. The vine is extensively cultivated, but, from carelessness in the process, the wine is not so good as might naturally be expected. The olive-grounds are extensive, and the produce excellent. Tobacco (of inferior quality), cotton, linseed, flax, hemp, saffron, and madder are also produced. The woods which clothe the mountain sides are chiefly composed of cork, chestnut, oak, pine, and other timber trees, which form a considerable item in the export trade. Many mountain slopes have, however, been much deteriorated in fertility by the excessive cutting down of timber.

The bullock is the favourite animal for draught; but horses are also used; and a small species of pony, which in ancient times was much esteemed by the Roman matrons, is still found. The sheep is of ordinary quality, and the swine are said to be among the best in Europe. Few cows are kept, and cheese is obtained almost wholly from sheep's and goat's milk. Wild boars and deer are not uncommon, and the Moufflon (q. v.) is found in the Alpine woods. Foxes, rabbits, hares, and martens are so abundant that a large export trade in their skins is carried on. The fisheries are important.

Manufactures are insignificant, being mostly the result of home industry; but the royal manufactures of gunpowder, salt, and tobacco are of considerable importance. S. is rich in minerals, but these and its other resources, are as yet little developed. Silver, mercury, granite, gypsum, marble, alabaster, amethyst, and other precious stones, are found; also lead, iron, and copper are in considerable abundance. Gold, bismuth, and antimony are said to exist.

Inhabitants.—The inhabitants bear a considerable resemblance to the Greeks, and speak a barbarous dialect, composed chiefly of Spanish, Arabic, and Italian; they are ignorant and bigoted, having

been subjected to misgovernment and oppression from their emancipation from Roman rule till 1836, when feudal tenure was abolished, and the enormous power of the clergy somewhat reduced. They are generally stupid and indolent, clothe themselves in sheep-skins, and invariably profess the Catholic religion. The custom of the *Vendetta* is frequently practised, though not to the same extent as in Corsica.

History.—S., at first called by the Greeks *Ichnusa* and *Sandalotis* (from its resemblance to a human foot-print), and afterwards *Sardo* by the Romans, was colonised at a very early period. The first really historical event is its conquest, about 480 B.C., by the Carthaginians, who, during their occupation, rendered the island a celebrated corn-producing country. They were forced to abandon it to the Romans (238 B.C.), who gradually subdued the rebellious natives, and made it a province of the empire; but on three several occasions, formidable outbreaks required the presence of a consul with a large army to restore the authority of Rome. From his time it was held as a subject province, and on account of its value as the 'granary of Rome,' was carefully protected from invasion. It fell into the hands of the Vandals and other barbarians, and was recovered by the Eastern Empire in 534 A.D., but was finally separated from the Roman Empire by the Saracens. They were driven out in their turn by the Pisans, one of whose deputy-governors, being supported by the Genoese, obtained the erection of a kingdom (1154) by Frederick I. The popes, who had long claimed a right of suzerainty over the land, gave it, in 1296, to James II. of Aragon; and continued in the possession of Spain till 1708, when it was taken possession of by the British, and by the peace of Utrecht (1713) it was yielded to Austria. In 1730, Austria gave it to the Duke of Savoy in exchange for Sicily, and it has since that time formed a part of the dominions of the House of Savoy. When S. came to the House of Savoy, two-thirds of it belonged to barons of Spanish descent, and the most of the remainder to the clergy, who also levied a tithe on the whole produce, and for a century afterwards, it was shamefully neglected by the government. However, in 1636 and 1837, patrimonial rights and compulsory labour were abolished; and in 1838 and 1847, the peasants were freed from the rest of the vexatious impositions with which they were burdened. In 1847, the vice-royalty was abolished, and S. incorporated with the Sardinian kingdom (q.v.). It is at present divided into two provinces or *capos*—Cagliari to the south, containing 5166 English sq. m., with a population of 393,208; and Sassari in the north, containing 4093 English sq. m., with a pop. of 43,452. Cagliari is the capital.

SARDONIC SMILE is a term applied by the older medical writers to a convulsive affection of the muscles of the face, somewhat resembling laughter. It may occur in tetanus or lock-jaw, and other convulsive affections, or may result from the action of certain vegetable poisons, such as the *Ranunculus aceleratus*, or Celery-leaved Crowfoot. The name is derived from a species of *ranunculus* that grows in Sardinia, termed *Herba Sardonica* or *Sardoa*.

SARGASSUM. See GULF-WEEK.

SARI, the capital of the province of Mazanderan, Persia, is situated on the banks of a small stream, the Tejend, 18 miles south of the Caspian Sea. It is a modern town, built near the ruins of a very ancient one, and contains a pop. of about 35,000, who carry on a small trade in the produce of the province with Russia, through the Caspian ports, and with the interior of Persia. It stands in the midst of

fine orange gardens adorned with beautiful cypresses. It used to be distinguished by a tower 100 feet high and 30 in diameter, without a staircase, and built of brick and mortar. The great causeway of Shah Abbas the Great, without which the forests of Mazanderan would be impervious, runs through S.—See *History of Persia* by C. Markham (1874).

SARK, one of the Channel Islands. See JERSEY.—THE CHANNEL ISLANDS.

SARMATIANS. The root *s-r-m* in this word is in all probability the same as *s-r-b*, so that it has been conjectured the name S. has the same ethnological meaning as *Serbi* and *Servi*. The oldest Greek form of the word (and the only one found in Herodotus) is *Sauromata*. The region occupied by the S. embraced (according to Ptolemy, our chief authority) a portion both of Europe and Asia.—1. The European S. are found as far west as the Vistula; as far north as the Venedicus Sinus (Gulf of Riga?), or even further; as far east as the Crimea and the Don; and as far south as Dacia. Roughly speaking, their territory corresponded to modern Esthonia, Lithuania, Western Russia, and parts of Poland and Galicia. The principal, or at least the best-known nations among the European S., were the Peucini and Bastarnæ, about the mouths of the Danube, and in Moldavia and Bessarabia; the Jazyges and Roxolani, probably in Kherson, Tauris, and Ekaterinoslav; the Venedi and Gythones, about Riga, Memel, and Elbing; and the Avareni, at the sources of the Vistula.—2. The Asiatic S. are found as far west as the Tanais (Don), as far east as the Caspian, as far south as the Euxine and Caucasus, and as far north as the water-shed between the rivers that fall into the White Sea and the Black, but we have no distinct knowledge of their territorial possessions. North of the Don, in the region now occupied by the Don Cossacks, dwelt the *Perierbidi*; south-east of it, about Astrakhan, the Jaxamata. Beyond the Perierbidi lay the Assæi, the 'horse-eating' (*Hippophagi*) Sarmatae, the 'Royal' and Hyperborean Sarmatae, and many others, besides a multitude of nations in the region of the Northern Caucasus. The question naturally arises: What were these Sarmatians? The vast extent of territory over which they spread, and the manifest inclusion under the name S. of different races, as, for example, Goths, Finns, Lithuanians, Circassians, Scythians, and Slaves, prove that the term was loosely used by Ptolemy and his contemporaries, just like the older Herodotean term Scythia, and is not strictly ethnological; yet Dr Latham's view (see Smith's *Dictionary of Greek and Roman Geography*, arts. Sarmatia and Scythia), that it designated on the whole Slavic races, and in particular the north-eastern portion of the great Slavic family, may be regarded as tolerably certain. The S. figure prominently among the barbarians who vexed the north-eastern frontiers of the Roman Empire.

SARNO, a city of Southern Italy, in the province of Principato Citra, on the river of the same name, 13 miles north-west of Salerno. It is a well-built town, with a very handsome cathedral containing some good paintings, and has a seminary for priests, a hospital, several paper-manufactories, and foundries. Its environs are famous for the produce of very fine silk. In the centre of the town, there are springs of sulphureous and chalybeate waters. Among the buildings worthy of notice is the ancient castle of the Barberini family. Pop. 15,341.

In the plain near S., Teias, king of the Goths, in a desperate battle with the Greeks, commanded by Narses, in 553, was vanquished and slain, and the reign of the Goths in Italy brought to a close.

SARPI, PIERRO, better known by his monastic appellation, **FRA PAOLO**, or Brother Paul, was born at Venice, in the year 1552; became an early proficient in mathematics, as well as in general literature, resolved to embrace the monastic life, and in his 20th year took the vows in the religious order of the **SERVITES** (q. v.). Soon afterwards, he was appointed by the Duke of Mantua to a professorship of theology in that city; but he held it only for a short time; and returning to his order, of which he was elected provincial in his 27th year, he continued to pursue in private his studies in languages, in mathematics, in astronomy, and in all the other branches of natural philosophy, including the medical and physiological sciences, in which he attained to great proficiency, being by some writers regarded (although, as it would seem, without sufficient grounds) as entitled to at least a share in the glory of the discovery of the circulation of the blood. The freedom of some of his opinions led to his being charged at Rome with heterodox views, and although held free from actual heresy, his opinions became an object of suspicion; and in the dispute between the republic of Venice and Paul V. (q. v.) on the subject of clerical immunities, S. justified these suspicions by the energy with which he threw himself into the anti-papal party. On being summoned to Rome to account for his conduct, he refused to obey, and was accordingly excommunicated as being contumacious. The zeal of S.'s opposition to Rome drew upon him the hostility of the partisans of the Roman claim; and an attempt was even made upon his life by a band of assassins, whom the ardour of party-spirit at the time did not hesitate, although, upon mere presumption, to represent as emissaries of the Jesuits. Fra Paolo himself openly professed to share this suspicion, and believing his life in danger, confined himself thenceforward within the enclosure of his monastery. It was in this retirement that he composed his celebrated *History of the Council of Trent*, which has long been the subject of controversy and criticism. It was published in London by Antonio de Dominis, the ex-bishop of Spalatro, who had recently conformed to Protestantism, at first under the pseudonym of *Pietro Soave Polano*, an anagram of the real name of the author, *Paolo Sarpi Veneto*; and it almost immediately rose into popularity with the adversaries of Rome as well in England as throughout the continent. It is by no means a simple history of the proceedings of the Council, but rather a controversial narrative of the discussions, in which the writer freely enters into the merits of the doctrines under discussion, and in many cases displays a strong anti-Catholic bias. His judgment of the motives and of the conduct of the members of the Council, especially of the representatives of the pope and his partisans in the assembly, is uniformly hostile, and has been accepted by Protestants as a strong testimony against Rome from a member of the Roman Church. It must be confessed, however, that whatever judgment we may form of S.'s credibility on his own merits, it is idle to look upon him in the light of a member of the church of Rome. It is plain, from numberless declarations in his work, and from remains of his correspondence published after his death, that his opinions were strongly biased, not merely with an anti-Roman, but even with rationalistic leanings; and Ranke does not hesitate to declare that his unsupported statements cannot be accepted with security, when there is question of a damaging narrative of some intrigue of the legates in the Council, or some cabal of the Italian bishops in the interest of Roman views. A voluminous counter-history of the Council of Trent

was written by the Roman Jesuit (afterwards Cardinal) Pallavicino, which follows him into the details as well of the history as of the controversy. It would be out of place here to enter into any comparison of these rival histories of the Council. The History of S. has been translated into most of the European languages. The French translation, by the celebrated Courayer, and is enriched with copious vindicatory and critical annotations. S. lived in the full vigour of intellect to the age of 71 and died of a neglected cold, which led to a protracted illness, in the year 1623. His life, as an ecclesiastic, was without reproach; and his literary zeal in the cause of the republic had made him the idol of his fellow-citizens. He was honoured accordingly by the republic with a public funeral. His *History of the Council of Trent* has been reprinted in numberless editions; and his collected works were published at Verona in 8 vols. fol. 1761—1768, and again at Naples, in 24 vols. 8vo. 1790.

SARRACENIA, or **SIDE-SADDLE FLOWER**, a genus of very singular marsh plants, native of North America. *S. purpurea* is common to Hudson's Bay to Carolina; the other species are confined to the Southern States. They are herbaceous perennial plants, with radical leaves and scapes, which bear one or more large flowers. The

Sarracenia Purpurea:

1, a flower, from which the corolla has fallen off, showing very large 5-angled stigma; a, a fully expanded fruit; b, section of the fruit.

leaves are of very remarkable structure, the calyx being hollow and urn-shaped, and the blade of the leaf articulated at its apex, and fitting like a lid. The name is from the form of the leaves that the name Side-saddle Flower is derived.—The genus is the type of the small natural order *Sarracenaceae*, the only genus of which has recently been discovered in Guyana. The order is regarded as closely allied to *Papaveraceae*.

SARREGUEMINES, formerly a small town in the north of France, in the dep. of Meuse, 41 miles east of Metz. It is famous for its manufactures of pottery; hempen fabrics and velvets also made. Pop. about 5000.

SARSAPARILLA, or **SARSA**. This employed medicine is the produce of several species of *Smilax* (q. v.), although the species yielding the different kinds brought to the market have not been fully ascertained. Among them, the principal are believed to be *S. officinalis*, *S. purpurea*, and *S. papyracea*; twining shrubs, with prickly angular stems; the first with large ovate-elliptical, acute, heart-shaped, leathery leaves; the second

with shortly acuminate smooth leaves; the lower ones heart-shaped, the upper ones approaching to ovate; the third with membranous, oval-oblong,

Sarsaparilla.

these leaves. These shrubs are natives of warm parts of America; *S. officinalis* and *S. papyracea* being found in South America, and *S. medica* on the Mexican Andes. Some botanists regard them as mere varieties of one species.

The part of the plant used in medicine is the dried root, of which the following are the characters, given in the British Pharmacopoeia: 'Roots not thicker than a goose-quill, generally many feet in length, reddish-brown, covered with rootlets, and divided in bundles about eighteen inches long, rootless; taste mucilaginous, feebly bitterish, and slightly acrid.' *S.* has been analysed by various chemists, and appears to consist of volatile oil, most of which is expelled during the process of drying, a white crystallisable neutral substance named *malacia*, whose composition is represented by the formula $C_{12}H_{12}O_6$, an acrid bitter resin, lignin, starch, and mucilage. *S.* is one of the class of medicines called Diaphoretics. The British Pharmacopoeia contains three preparations of this drug—viz., the Decoction, the Compound Decoction containing *S.*, sassafras chips, guaiac wood-turnings, juniper root, and mezereum, and the Liquid Extract. The cases in which they are serviceable are those of chronic rheumatism, secondary syphilitic lesions, chronic skin diseases, &c. To be of any service, *S.* must be taken in considerable doses. The compound decoction, formerly known as the decoction of *Sweet Woods*, is the best preparation, and should be taken in doses of four or six ounces three times a day.

The root of *S. aspera*, a native of the south of Europe, is used as a substitute for *S.*, although of inferior quality, and is called Italian sarsaparilla.

The root of *Hemidesmus Indicus*, a climbing shrub of the natural order *Asclepiaceae*, is used in India as a substitute for *S.*, and is therefore called Indian sarsaparilla. The plant is common in all parts of India. The root has a peculiar aromatic odour and bitter taste. In consequence of the high price asked for genuine *S.*, the root of *Hemidesmus Indicus*, or *Indian Sarsaparilla*, has been introduced into the British Pharmacopoeia. The following are its characters: 'Yellowish-brown, cylindrical, tortuous, furrowed, and with annular cracks, having a fragrant odour, and a very agreeable flavour.' The official preparation is the Syrup; but in India, where this root is highly esteemed as a diaphoretic

and tonic, and is extensively used as a substitute for *S.*, an Infusion, prepared by infusing two ounces of the root in a pint of boiling water, is generally employed, the dose being from two to four ounces three times a day. The syrup is chiefly used, in consequence of its pleasant flavour, as a vehicle for more active medicines.

In Germany, the roots of *Carex arenaria*, *C. disticha*, and *C. hirta* (see *CAREX*) are occasionally used as a substitute for *S.*, under the name of German sarsaparilla.

SARTHE, an inland dep. of France, north of the Loire. Area 2395 sq. m.; pop. (1872) 446,603. It is a country of plains, traversed by low hills and by undulations clothed with vines, of large picturesque forests, and of pleasant valleys. The soil is fertile, productive in grain and in clover; hemp is cultivated, and hempen fabrics largely manufactured. The wine produced is of a mediocre quality. The climate is healthy and temperate. Clover-seeds are exported to England and Holland, and swine and cattle are reared in large numbers for the Paris and other markets. *S.* is divided into the four departments of Mans, La Flèche, Mamers, and St Calais. The capital is Le Mans. See *MANS*, LE.

SARTI, GIUSEPPE, one of the most skilful and learned musical composers of the 18th c., was born at Faenza in the Papal States in 1729. He studied under Padre Martini at Bologna; and in 1752 produced his first opera, *Il Re Pastore*, which was performed at Faenza with great success. He held for a time the office of *Hof Kapellmeister* at Copenhagen, but returned to Italy in 1765. In 1770, and the following years, he composed his principal operas, including *Le gelosie villane* and *Giulio Sabino*, the latter of which was enthusiastically received throughout Italy, and is highly praised by Dr Burney. In 1779, he became *maestro di capella* of the Duomo at Milan, and gave himself to the composition of church music. In 1784, he went to St Petersburg as music director of the court of the Empress Catharine, by whom he was treated with great liberality, and raised to the highest rank of nobility. He died at Berlin in 1802, on his way to Italy. His operas are thirty in number; but the composition by which he is now most known is his beautiful sacred terzett, *Amplius Lava Me*. *S.* was the musical instructor of Cherubini (q. v.).

SARTO, ANDREA DEL, one of the most famous painters of the Florentine school, was born at Florence in 1488. According to later writers, the family name was Vannucchi, and Andrea only received the name of *del Sarto* (the Tailor) from the occupation of his father; but this statement is probably erroneous. *S.* was a pupil of Piero di Cosimo, but formed his style mainly through study of the works of Masaccio, Domenico Ghirlandajo, and Buonarroti. These artists inspired him with a love of fresco-painting, in which he achieved great distinction. During 1509—1514, he executed a series of representations from the life of St Filippo Benizzi, in the porch of the Annunziata at Florence; and in these the characteristics of his genius—dignity of composition, purity of form, freshness of colour, and grace of expression—are seen at their best. In 1514 he commenced a series of frescoes from the life of John the Baptist, which were not finished, however, till 12 years afterwards. The finest works, of what may be called his middle period, are the 'Madonna di San Francesco' and the 'Contending Theologians,' both in the Florentine galleries. In 1518, Francis I. invited *S.* to Paris, where he painted, among other things, the picture of 'Charity' in the Louvre; but at the solicitations of his wife

returned to Florence, where he died in 1530. To the later years of his life, which were neither happy nor honourable, belong his 'Piety,' his most celebrated fresco the 'Madonna del Sacco' (in the Annunziata at Florence), the 'Madonna with Saints' (in the Berlin Museum), and the 'Sacrifice of Abraham' (in the Dresden Gallery). His largest fresco is the 'Lord's Supper,' in what was formerly the Abbey of San Salvi, near Florence.—See Reumont's *Andrea del Sarto* (Leip. 1835).

SARUM, OLD, an extinct city and borough of England, was situated on a hill two miles to the north of Salisbury, in Wiltshire. It dated from the time of the Romans, by whom it was known as *Sorbiodunum*, and remained an important town under the Saxons. A Witenagemôte was held at O. S. in 960; and here William the Conqueror assembled all the barons of his kingdom in 1086. It was the seat of a bishop from the reign of William the Conqueror till 1220, when the cathedral was removed to New Sarum, now Salisbury (q. v.), and was followed by most of the inhabitants. In Henry VII.'s time it was almost wholly deserted, and has so continued till the present time. Some traces of walls and ramparts, and of its cathedral and castle, are still seen. Though without a single house or inhabitant, two members represented it in parliament, till, like many other rotten boroughs, it was disfranchised by the Reform bill of 1832. William Pitt, Earl of Chatham, first sat in parliament for O. S. in 1735.

SARVĀSTIVĀDAS, or **SARVĀSTIVĀDINS** (lit., those who maintain the reality of all existence), is the name of one of the four divisions of the *Vaiśhāhika* system of Buddhism; its reputed founder was *Rāhula*, the son of the Buddha Śākyamuni.—See C. F. Koeppen, *Die Religion des Buddha* (Berlin, 1857); and W. Wassiljew, *Der Buddhismus, seine Dogmen, Geschichte und Literatur* (St Petersburg, 1860).

SARZA'NA, a city of Northern Italy, in the province of Genoa, 8 miles east of Spezia. Its cathedral, built in 1200, is very rich in paintings and marbles. There is also an ancient fortress built by the Pisans in 1262. It is the birthplace of Pope Nicholas V. Pop. about 9000.

S. is a very ancient city, founded 176 B.C. The adjacent city of Luni having been sacked and destroyed by the Vandals and by the Normans, its inhabitants abandoned it, and took refuge in **S.**, to which place they removed the episcopal see in 1204. There are still remains of the amphitheatre of Luni.

SASH, in the British Army, is a military distinction worn on duty or parade by officers and non-commissioned officers. For the former, it is of crimson silk; for the latter, of crimson cotton. It is tied on the right side by the cavalry, and on the left side by the infantry. In Highland regiments, the sash is worn over the left shoulder and across the body.

SASH. The frames in which the glass of windows is inserted are called window-sashes. Common windows are usually made with an upper and lower sash, contrived so that, by means of cords or chains, pulleys, and balance-weights, they slide up and down in a wooden case.

SASIN. See **ANTELOPE**.

SAS'INE. (See **INFERTMENT**.) The ceremony was as follows: the attorney of the party giving the right produced his warrant of title, and gave it to the bailie or representative of the other party, who gave it to the notary to be explained by the latter to witnesses, and then the first party delivered

earth and ground, that is, part of the very soil, to the other in presence of the witnesses. The notary then drew up an instrument reciting what had been thus done, and which was signed by the notary and two witnesses. In England, *seisin* never had a narrow and technical a meaning as it had in Scotland.

SASKATCHEWAN, a large, important, and only recently-explored river of British North America, draws its waters from the Rocky Mountains, and is formed by two head-waters called the South Branch or Bow River, and the North Branch. The South Branch issues from a lake about four miles long, fed by a glacier descending from a magnificent *mer de glace*, and by a group of springs in the vicinity. A few yards north of this group of springs is another group, from which the North Branch takes its rise. The height above the sea is 6347 feet; the lat., 51° 40' N.; the long., 117° 30' W. The South Branch flows south-east to a junction with the Belly River in long. 111° 40' W., then north-east to its junction with the North Branch in long. 105° W. Fed mainly from the same glacier that feeds the South Branch, the North Branch flows north past Mount Murchison, 13,700 feet above sea-level, and one of the highest peaks of the Rocky Mountains, north through Kootenai Plain, a fine prairie abounding in game, and it flows in a general eastern direction to its confluence with the South Branch. From long. 105° W. the river flows east, and falls into Lake Winnipeg. Entire length stated at 1600 miles. From its mouth it is navigable (on the North Branch) to Rabbit Mountain House, a distance of 1000 miles. It flows through a country rich in coal and iron, with a healthy climate, and comprising almost boundless plains suited to the cultivation of grain. At its sources on the S., there are several easily practicable routes across the Rocky Mountains, especially a mountain-road called Vermilion Pass, which is practicable for carts.—*Journal of the Geographical Society* for 1860.

SASSAFRAS (*Sassafras*), a genus of tree or shrubs of the natural order *Lauraceae*, having 5-crested flowers, a 6-parted membranous perianth, stamens, a succulent fruit placed on the thick apex of the fruit-stalk, and surrounded by the unchanged perianth. The **S.**-tree (*S. officinale*) is a North America, found from Canada to Florida. It is a mere bush in the north, but a tree of 50 feet in the south, has deciduous leaves, yellow flowers, and appears before the leaves, and small dark-blue fruit. The wood is soft, light, coarse in fibre, dirty-white, and reddish-brown, with a strong but agreeable smell, resembling that of fennel, and an aromatic, rather pungent and sweetish taste. The wood of the root possesses these properties in a higher degree than that of the stem, and the thick spongy bark of the root most of all. The wood is brought to market in the form of chips, but the bark of the root is preferred for medicinal use, is a powerful stimulant, sudorific, and diuretic, and is employed in cutaneous diseases, gout, rheumatism, and erysipelas, generally in combination with other medicines. It contains a volatile oil, *Oil of S.*, which is often used instead. An agreeable beverage is made in North America by infusion of **S.** bark or **S.** wood; and a similar beverage was once very commonly used at daybreak in the streets of London under the name of *Saloop*. A few saloop-vendors are still to be seen plying their vocation. The leaves of **S.** contain so much mucilage that they are used for thickening soup.—Another species of **S.** is *parthenocylon*, possessing similar properties, and found in Sumatra.

SASSAFRAS NUTS. See **PITCHURIM BEANS.**

SASSA'NIDÆ, the dynasty which succeeded that of the **ARACIDÆ** on the throne of Persia (q. v.), derived its name from Sassan, the grandfather of the newly-elected monarch **ARDISHIR**. The reign of the Sassanides is remarkable in the history of Persia, not for the extent of their sway, or the luxury and magnificence of their court, though in these respects they could vie with the **Achæmenidæ** at the epoch of their greatest power and splendour, but for the intense energy which they succeeded in infusing into the people at large. A comparatively small army of Greeks might and did successfully strive against the immense hordes of a Xerxes and Darius; but the veterans of Rome could gain no permanent laurels in a conflict with an equal force of Persians under the Sassanides. **Ardishir** made the desert of Khiva and the Tigris his boundaries, and resigned the throne to his son, **SHAHPUR** (SAPOR) (240—273 A. D.), who subdued Armenia, took Algézira (258) and Nimbia, totally routed the Romans at Edessa, taking prisoner the Emperor Valerian and the relics of his army, and overrunning Syria, Cappadocia, and other portions of Western Asia. This monarch paid as much attention to the prosperity of his subjects and the encouragement of the fine arts as he did to the extension of his power; but his enlightened plans were not carried out by his immediate successors.—**NARSI** (NARSES) (294—303) retook Armenia, and signally defeated the Romans under Galerius; but fortune deserted him in the following year (297).—His grandson, **SHAHPUR II.** (310—381), surnamed **POSTUMUS**, an infant, succeeded, and Persia, during his minority, was much harassed by the Arabs, Romans, and Tartars; but Shahpur had no sooner taken in his hands the reins of government, than in return, he ravaged Yemen, punished the Tartars, and took the sole revenge at that time in his power against the Romans, by commencing a dreadful persecution of the Christians in his dominions. A regular war speedily followed; the army of Constantius was routed at Singarah, and he was compelled to sue for peace. But the war continued; Constantius's successor, Julian, was defeated, and lost his life (363) near Ctesiphon, and the Romans were glad to conclude the humiliating peace of Dura. Armenia, Iberia, and the other Caucasian principalities were then reduced by Shahpur. The wholesome terror thus infused into the Romans effectually restrained them from aggressions for many years.—Among his successors were **BAHARAM V.** (420—448), surnamed **FOUR**, who recommenced hostilities with the Romans, the result being a partition of Armenia and a truce for 100 years; and **KOBAD** (**COBADES** or **ABADES**) (488—498, 502—531), a wise and able monarch, who, on the Romans refusing any longer to pay the stipulated tribute, declared war against them, and defeated them in every engagement, concluding peace (505) on receiving 11,000 lbs. of gold. A second war, which commenced in 521, was from beginning to end in favour of the Persians, though the Romans at that time possessed a staff of generals unsurpassed at any previous epoch of their history. The war continued for some time after the accession of **KHUSRU I.** (q. v.) (531—579), and was continued at intervals till nearly the conclusion of the century, when another great Persian conqueror, **KHUSRU II.** (q. v.) (591—628), ascended the throne; but the details of his annihilation of the Roman power in Asia, and the resistless march of **Heraclius** (q. v.), who again cooped up the Persians within the Tigris, and inflicted upon the S. a blow from which they never recovered, will be found under these names.—After four years of petty civil war, which wore out the remaining strength of the

nation, **YESDIGERD III.** (632—651) was raised to the throne. The Arabs, who had already twice attacked Persia without success, made a third attempt in 639, and routed Yesdigerd's army at Kudesah (Cadesia) with immense loss. Yesdigerd made another energetic attempt to rescue his kingdom; but the great battle of Nahavend, in which more than 100,000 Persians are said to have been slain, extinguished all hope of success; and the unfortunate monarch became a fugitive and a wanderer in Northern Khorassan till 651, when he was treacherously murdered.—Thus perished the dynasty which had pulled down the Romans from their proud pre-eminence among nations by the hands of a horde of robber-fanatics, under whose barbarous rule the extensive commercial prosperity and refined civilisation which had been so carefully fostered for four centuries, were utterly swept away, leaving only such traces as ruined aqueducts, choked-up canals, and the still magnificent remains of almost forgotten cities.

SA'SSARI, a city in the north-west of the island of Sardinia, the chief town of the province of the same name, 8 miles from the shore of the Gulf of Asinara. It is a handsome and important archiepiscopal city, and has a vast cathedral, with many sculptures, one of which is by Canova; a university, founded in 1776; a college; and a rich library, with the MSS. of the Azuni. S. is a very busy town, and trades especially in grain, wine, fruits, wool, olive oil, and tobacco. Its harbour, Torres, is 10 miles north-west of S.; it is narrow and shallow, and does not admit large vessels. Pop. 22,945.

SATAN. See **DEVIL.**

SATARA, generally spelled *Sattara*, a collectorate in the Poona division of the Bombay presidency, British India, is bounded on the N. by the state of Poona, and on the W. by the lofty ridge of the Western Ghats. Area, 11,000 sq. m.; pop. 1,220,000. **SATARA**, the capital, from which the state derives its name, one of the most salubrious and pleasant stations in the Deccan, 133 miles south-east of Bombay. Pop. inconsiderable.

SATELLITES (Lat. *satelles*, an attendant) are certain celestial bodies which attend upon and revolve round some of the planets, as these latter revolve round the sun; and hence scientific men frequently apply to them the generic term, 'secondary planets.' The Earth, Jupiter, Saturn, Uranus, and Neptune, each possesses one or more of these attendants. The eclipses, inequalities, inclinations, and reciprocal attractions of the satellites, have been carefully noted from time to time, and the theory of their motions, at least of the most prominent of them, has been found to coincide with that of the moon. The satellites of Jupiter are invested with additional interest, from their eclipses having been the means of directing Römer to his great discovery of the successive propagation and velocity of light. On careful investigation, he found that the eclipses regularly happened 16' 26" earlier when the planet was in opposition (i. e., nearest the earth), than when it was in conjunction (i. e., furthest from the earth), a phenomenon which could only be accounted for by the supposition, that light requires 16' 26" to pass over a distance equal to the diameter of the Earth's orbit.

SATIN, a fabric in which so much of the weft is brought uppermost in the weaving as to give a more lustrous and unbroken surface to the cloth than is seen when the warp and weft cross each other more frequently; this will be better understood by reference to the figure than by any verbal description. A are the warp threads, of which only every tenth

one is raised to allow the shuttle to pass, but they are all raised in regular succession, so that the weaving is quite uniform throughout; B are the weft threads; and C is the selvage, which is formed on each side of the piece of stuff by the

regular method of plain-weaving, that is, by raising every other warp thread for the passage of the weft. The term satin is very rarely applied to any other than silk fabrics, woven as described; but there are woollen, linen, and cotton satins known in the markets.

SATIN-BIRD. See BOWER-BIRD.

SATINET, an inferior satin, woven much thinner than the ordinary kind. The term is also occasionally applied to a variety of cloth woven with cotton warp and woollen weft.

SATIN-WOOD, a beautiful ornamental wood obtained from both the West and East Indies. The former is the better kind, and is supposed to be the produce of a moderate-sized tree, *Ferolia Guianensis*, and probably other species, as there are several varieties of the wood. That from the East Indies is less white in colour, and is produced by *Chloroxylon Swietenia*. Both are much used by cabinet-makers, and for marquetry, &c. The logs are usually only 6 or 7 inches square.

Chloroxylon Swietenia is a tree of the natural order *Cedrelaceae*, growing on the mountains of the Circars in India, and in Ceylon. Sir James E. Tennent says that 'in point of size and durability, it is by far the first of the timber-trees of Ceylon. The richly-coloured and feathery logs are used for cabinet-work, and the more ordinary for building purposes, every house in the eastern province being floored and timbered with satin-wood.'—Tennent's *Ceylon*.

SATIRE (Lat. *sătira*; older form, *sătira*), the name given by the Romans to a species of poetry of which they may be considered the inventors. The word *satura* (from the root *sat*, enough) is strictly and originally an adjective, meaning 'full' or 'filled'; but afterwards it came to possess also a substantive signification, and denoted a dish filled with a medley of ingredients, like the *Pot-pourri* (q. v.) of the French, or the *Olla Podrida* (q. v.) of the Spaniards. Hence, in its figurative application to a branch of literature, it throws a light on the primary character of that literature. The oldest Roman satire was a medley of scenic or dramatic improvisations expressed in varying metres (Livy, lib. 7, cap. 2), like the Fescennine Verses (q. v.); but the sharp banter and rude jocularity of these unwritten effusions bore little resemblance, either in form or spirit, to the earnest and acrimonious criticism that formed the essential characteristic of the later satire. The earliest—so far as we know—who wrote *saturæ*, were Ennius (q. v.) and Pacuvius; but the metrical miscellanies of these authors were little more than

serious and prosaic descriptions, or didactic homages and dialogues. Lucilius (b. 148, d. 103 B.C.), is universally admitted to be the first who handled men and manners in that peculiar style which has ever since been recognised as the satirical; and the particular glory of Lucilius, in a literary point of view, consists in this, that he was the creator of a special kind of poetry, which in all subsequent ages has been the terror and aversion of fools and knaves. The serious and even saturnine gravity of the Roman mind has not have readily disposed it to a censorious view of public and private vices. After the death of Lucilius, satire, as well as other forms of literature, languished; nor do we meet with any satirist of note till the age of Horace (q. v.), whose writings are as a glass in which we behold mirrored the tastes and habits of the Augustan age. His satire, though sharp and caustic at times, is in the main humorous and playful. It is different when we come to Juvenal (q. v.)—a century later, when satire became a *arma infans natio*, a savage onslaught on the tremendous vices of the capital. Persius (q. v.), who lived in the generation before Juvenal, is every way inferior in force of genius, to the latter. After Juvenal we have no professed satirist, but several vices of prose and poetic, in whom the satiric element is found, of whom Martial, the epigrammatist, is perhaps the most notable.

During the middle ages, the satirical element shewed itself abundantly in the general literature of France, Italy, Germany, England, and Scotland. Men who have a claim to the character of satirists *par excellence*, are Ulrich von Hutten, one of the authors of the *Epistolæ Obscurorum Virorum* (q. v.), Erasmus (q. v.), Rabelais (q. v.), Sir David Lindsay (q. v.), George Buchanan (q. v.). In all these writers, priests are the special objects of attack; their vices, their greed, their folly, their ignorance, are lashed with a fierce rage. It was in France that satire as a formal literary imitation of antiquity first appeared in modern times. Vauquelin (q. v.) may be considered the true founder of modern French satire. The satirical verses of Mottin, of Sigogne, and of Berquin, of Mathurin Regnier, *L'Espadon Satirique* of Lequerraux, and *Le Parnasse Satirique*, attributed to Théophile Viaud, are very impure in expression, and remind us that at this time a satire was understood to be an obscene work—the 17th century supposing that the name had something to do with Satyr, and that the style ought to be conformable to what might be thought appropriate to the lascivious deities of ancient Greece! During the 17th and 18th centuries, both England and France produced professed satirists of the first order of merit, who have not been surpassed by the best either of their predecessors or successors. The names of Dryden (q. v.), Butler (q. v.), Pope (q. v.), and Churchill (q. v.) on this side of the Channel, of Boileau (q. v.) and Voltaire (q. v.) on the other, are too well known to require more than mention. Dr Edward Young (q. v.) and Dr Johnson (q. v.) have also made a name for themselves in this kind of literature. It may be noticed, however, as a distinguishing characteristic of Dryden, Boileau, Pope, Churchill, and Johnson, and as a mark of the difference of the times in which they lived from those of the satirists of the Reformation, that it is no longer the church that is assailed, but secular, political opponents, literary rivals, &c.; the war is carried on, not so much against bad morals as the clergy, as against the common vices of men in general, or is even the expression of personal hatreds. Swift (q. v.) and Arbuthnot (q. v.) are perhaps as great satirists as any of those who have been mentioned.

Satire in the shape of political squibs, lampoons, &c., is very abundant in the 17th and 18th centuries. Butler's *Hudibras* is simply one long lampoon against the Puritans; most of the playwrights of the Restoration were royalist satirists—unscrupulous and indecent partisans. Dryden himself was it *facile princeps* of the herd. Andrew Marvell (q. v.) is the most famous name on the side of party. The *Beggars' Opera* of the poet Gay is a sea of very fine political satire. Gifford (q. v.) and Alcott (q. v.), better known as Peter Pindar, also serve mention in a historical point of view, though their intrinsic merits are small. Incomparably prior to all their contemporaries, and among the first order of satirists, are Robert Burns (q. v.) and *Waver* (q. v.).—Meanwhile, in France, since Voltaire, no great name has appeared, except, perhaps, that of Béranger (q. v.), though the spirit of satire pervaded most of the current literature, more particularly political literature, of which one of the latest expressions is the pamphlet published 1865 by M. Rogeard against the system of government pursued by Napoleon III., and entitled *Propos de Labienus*. In Germany, the most conspicuous modern names are those of Hegel, Rabener, Sturz, Stolberg (q. v.), Kästner, Tietze (q. v.), Tieck (q. v.), and Goethe (q. v.), but none of these have adhered very strictly to the classic models of satire. Of 19th c. satirists in England, the best names are Byron (q. v.), the others Smith (q. v.), and Hood (q. v.) in poetry; Hook (q. v.), Jerrold (q. v.), Thackeray (q. v.), Carlyle (q. v.) in prose. To these may be added the name of the author of the *Biglow Papers*, now Russell Lowell.—See Sellar's *Roman Poets of the Republic* (Edinb. 1863); Browne's *History of Roman Classical Literature* (Lond. 1853); Thomson's *History of Roman Literature* (forming a volume of *Encyclopædia Metropolitana*); Mommsen's *History of Rome*; Niebuhr's *Lectures on Roman History*; Viollet le Duc, article 'Satire' in the *Dictionnaire de la Conversation*; and James Hannay's *Satire in Satire*.

SATRAP, in the ancient Persian monarchy, was governor of a province, whose power—so long he enjoyed the favour of the king—was almost absolute. He levied taxes at his pleasure, and made laws the tyranny of his great master without hindrance. When the monarchy of Cyrus began to decline, some of the satraps threw off their allegiance, and founded independent kingdoms or sultanates of their own, the most famous of which in ancient times was the Mithridatic kingdom of Pontus. See PONTUS and MITHRIDATES.

SATURN, an ancient Italian divinity, who presided over agriculture. His name, from the same as *saturn* (*sevo*, to sow), indicates what was probably one of the earliest personifications in the Italian religion, S. being the god who blessed the sower of the sower. His identification with the Greek Kronos by the later Græcising myth-mongers is peculiarly infelicitous blunder, and has led to more than ordinary confusion. The two have utterly nothing in common except their antiquity. The Greek *Demeter* (Ceres), it has been observed, reaches far more closely to the Italian conception of the character of Saturn. The process of amalgamation in the case of Kronos and S. is visible enough. There is the Greek myth. Kronos, son of Uranos (Heaven) and Gea (Earth), is there the youngest of the Titans. He married Rhea, by whom he had several children, all of whom he devoured at birth except the last, Zeus (Jupiter), whom his mother saved by a stratagem. The motive of his rage for this horrible conduct was his hope of

frustrating a prophecy which declared that his children would one day deprive him of his sovereignty, as he had done in the case of his father Uranos; but fate is stronger even than the gods, and when Zeus had grown up, he began a great war against Kronos and the Titans, which lasted for ten years, and ended in the complete discomfiture of the latter, who were hurled down to Tartarus, and there imprisoned. So ran the common myth. But other myths added, that after his banishment from heaven, Kronos fled to Italy, where he was received hospitably by Janus, who shared his sovereignty with him. At this point the Greek myth coalesced with the Italian. S., the old homely deity of the Latin husbandmen, was transformed into a divine king, who ruled the happy aborigines of the Italian peninsula with paternal mildness and beneficence, taught them agriculture and the usages of a simple and innocent civilisation, and softened the primitive roughness of their manners. Hence the whole land received from him the name of *Saturnia*, or 'land of plenty.' His reign was that 'golden age,' of which later poets sang as the ideal of earthly happiness, and in memory of which the famous *Saturnalia* (q. v.) were thought to have been instituted. At the foot of the Capitoline, where the fugitive god had formed his first settlement, there stood in historical times a temple dedicated to his worship. Ancient artists represented him as an old man, with long straight hair hanging down, the back part of his head covered, his feet swathed in woollen ribbons, and a pruning-knife or sickle-shaped harp in his hand. Other attributes, as the scythe, serpent, wings, &c., are of later invention.

SATURNALIA, an ancient Italian festival, instituted, according to the common belief of the ancients, in memory of the happy reign of Saturn (q. v.). Discarding all mythical explanations of the institution of the S. as simply incredible, and not worth the trouble of refutation, we may rationally conjecture that the S. was a rural festival of the old Italian husbandmen, commemorative of the ingathering of the harvest, and therefore of immemorial antiquity. It is not, we conceive, to be doubted for a moment that the untrammelled licentiousness of the S. was familiar to the farmers of Latium long before their homely national god, who blessed the labours of seedtime with abundant fruit, had been decorated with incongruous Hellenic honours, and transformed into a skyey Titan. Later ages may have introduced novel elements into the S. befitting the hybrid myth of king Saturn, but originally, no thoughtful investigator can doubt that the cessation from toil, and the wild self-abandoning mirth that marked the feast, were expressive of the labouring man's delight that the work of the year was over, and not of an artificial enthusiasm for a 'golden age' that never had been. The great feature of the S., as we know the festival in historical times, was the temporary dissolution of the ordinary conditions of ancient society. The distinctions of rank disappeared or were reversed. Slaves were permitted to wear the *pilleus*, or badge of freedom, and sat down to banquets in their master's clothes, while the latter waited on them at table. Crowds of people filled the streets, and roamed about the city in a peculiar dress, shouting *Io Saturnalia*; sacrifices were offered with uncovered head; friends sent presents to each other; all business was suspended; the law-courts were closed; school-boys got a holiday; and no war could be begun. During the Republic, the S. proper occupied only one day—the 19th of December (xiv. Kal. Jan.). The reformation of the calendar by Julius Caesar caused the festival to fall on the 17th (xvi. Kal. Jan.), a change which produced much

confusion, in consequence of which the Emperor Augustus ordained that the S. should embrace the whole three days 17th, 18th, and 19th of December. Subsequently, the number was extended to five, and even seven, though even in the times before the Empire, it would appear that the amusements often lasted for several days. But while the whole week was regarded in a general sense as devoted to the S., three distinct festivals were really celebrated—the S. proper; the *Opalia*, in honour of *Ops*, the wife of Saturn; and the goddess of field-labour (from *opus*, a work); and the *Sigillaria*, in which *sigilla*, or little earthenware figures, were exposed for sale, and purchased as children's toys. The modern Italian Carnival (q. v.) would seem to be only the old pagan S. baptised into Christianity.

SATURNIAN VERSE, the name given by the Romans to that species of verse in which their oldest poetical compositions, and more particularly the oldest national poetry, were composed. In the usage of the later poets and grammarians, the phrase has two different significations. It is applied in a general way to denote the rude and unfixed measures of the ancient Latin ballad and song, and perhaps derived its name from being originally employed by the Latin husbandmen in their harvest-songs in honour of the god Saturn (q. v.). In this sense, it simply means *old-fashioned*, and is not intended to determine the character of the metre. It is also applied to the measure used by Nævius, and a common opinion, sanctioned by the great name of Bentley, is, that it was a Greek metre introduced by him into Italy. But though the Saturnian verse is found among the measures employed by Archilochus, scholars generally incline to the opinion that this is an accidental coincidence, that the measure of Nævius is of Italian (Hermann even thinks of Etruscan) origin, and that it merely improved on the older ballad-metre—the primitive Saturnian verse. It continued in use down to the time of Ennius (q. v.), who introduced the Hexameter (q. v.). According to Hermann, the basis of the verse is contained in the following *schema*:

— — — — — | — — — — —

which, as Macaulay happily points out, corresponds exactly to the nursery rhyme,

The queen was in her parlour | éating bréad and hóney,
and is frequently found in the Spanish poem of the *Cid*, the *Nibelungen Lied*, and almost all specimens of early poetry; but in the treatment of it a wide and arbitrary freedom was taken by the old Roman poets, as is proved by the still extant fragments of Nævius, Livius Andronicus, Ennius, and of the old inscriptionary tables which the *triumphatores* set up in the Capitol, in remembrance of their glorious achievements.—See *History of Roman Literature*, by Thompson, Arnold, Newman, &c. (*Encyclopædia Metropolitana*, 1852); Browne's *History of Classical Roman Literature* (1853); Niebuhr's *History of Rome*; Preface to Macaulay's *Lays of Ancient Rome*; and Sellar's *Roman Poets of the Republic* (1863).

SATYRIASIS (see SATYRS) is the insanity, or the ungovernable sway of the lowest instincts and propensities, by which man becomes an animal in its savage and excited state. The ancients were acquainted with this loathsome form of alienation, in which man is the sport of foul and dangerous instincts, and recognises no law or hindrance to the promptings of hunger, thirst, or lust. It still appears at puberty and in dotage, but is more rarely met with; and its disappearance may be hailed as significant of the predominance of the higher sentiments, or of the subjection of propen-

sities to law, decency, and decorum.—Mason Good, *Study of Medicine*, vol. v. p. 124; Sauvages, vol. i. p. 214.

SATYRS, in Greek Mythology, were a race of woodland deities, first mentioned by Hesiod, who designates them—'the race of worthless Satyr unfit for work.' Subsequently, they figure in great numbers in the train of Dionysus (Bacchus)—the leader being that model of tipsy revellers, the sober Silenus! In appearance, they were at once grotesque and repulsive, like all old woodland demons. They are described as robust in frame with broad snub noses, large pointed ears like those of animals (whence they are sometimes called 'wild beasts'), bristly and shaggy hair, rough little horny knobs on their foreheads, and goat-tails. The S. are of course sensual in their inclinations, and ravers of the woodland symphonies of music, dancing, wine, and of the orgies that follow a debauch. The Romans identified them with the *Fæuni* of their own mythology, and gave them larger horns and those goat feet with which they are so often represented. Ancient sculpture was fond of the Satyr as a subject—one of the most famous specimens of ancient art being the Satyr of Praxiteles (q. v.).

SAUCES are preparations of various condiments used for the purpose of giving piquancy and flavour to various kinds of food, chiefly animal. Some have been in use from the earliest times of civilisation. The ancients prized themselves much in their sauces, and used them almost wholly with their meats. The Greeks, but seem to have arrived at the summit of their reputation at the time of the Roman Empire, when that *garum*, made from a fish called *garos* by the Greeks, probably the anchovy, was considered one of the greatest luxuries of the table. Besides this, many other sauces were made of the tunny and other fishes. In modern times, we have seen a great variety: there are those ready prepared by Harvey's, the Worcestershire, the Holywood, the basis of which is Ketchup (q. v.), which is one of the most extensively known sauces. There are a large number prepared, when wanted, by the cook, to suit every kind of dish sent to the table. These usually consist of rich soups thickened with flour or other materials, and flavoured with some suitable condiment. In the approaches of British cookery is the extensive use of a sauce called melted butter, which is a little better than billstickers' paste, and what the best is a little flour, water, and butter stirred together, and well mixed; and it is the habit to serve this to almost every kind of dish needing a sauce, whether animal or vegetable.

SAUCISSON, or **SAUSAGE**, is a fascine of meat, rather than the usual length; but the principal application of the term is to the apparatus for firing a mine. This consists of a long bag or pipe of cloth, or leather, from one inch to one and a half inch in diameter, and charged with gunpowder. One end is laid in the mine to be exploded, and the other is conducted through the galleries to a place where the engineers can fire it in safety. The electric spark is now preferred to the saucisson.

BLASTING.

SAUER-KRAUT, a preparation of the coarse white cabbage, well known and in extensive use in Germany and the north of Europe, where it supplies during the winter the place of fresh vegetables. The cabbages are gathered when they have formed firm white hearts; and these, sliced into shreds, are placed in a succession of thin layers in a cask, each layer being sprinkled with fine salt.

to which some add juniper berries, cummin seed, caraway seeds, or other condiment. A board is then placed on the top, with a heavy weight, so as to press the whole down firmly, but gently. After a time, fermentation begins; and when a sour smell arises from the cask, it must be removed into a cool place, and kept for use. It is generally eaten boiled, in the same way as fresh cabbage.

SAUL, the first king of Israel, was the son of Kish, a wealthy chief of the tribe of Benjamin. The circumstances that marked his election to the royal dignity are familiar to all the readers of Scripture, and need not be repeated here (see JEWS, SAMUEL). Gigantic in stature, noble in mien, and imperious in character, he appeared admirably fitted to accomplish the task of consolidating the dislocated tribes of Israel. His earlier achievements augured hopefully for his future. The deliverance of the men of Jabesh Gilead, above all, his victories over the Philistines, the Moabites, Ammonites, Edomites, and Amalekites, were unmistakable proofs of his vigorous military capacity, but gradually there shewed itself in the nature of the man a wild perversity—'an evil spirit of God,' as it is called—culminating in paroxysms of insane rage, which led him to commit such frightful deeds as the massacre of the priests of Nob. Samuel, who had retired from the 'court' of S., and had secretly anointed David as king, did not cease to 'mourn' for the wayward monarch; but nothing availed to stay his downward career, not even the noble virtues of his son Jonathan; and at last he fell in a disastrous and bloody battle with the Philistines on Mount Gilboa.

SAUMAREZ, JAMES, BARON DE, a celebrated naval hero, was descended from an old French family, which had long been settled in Guernsey, and was born there, 11th March 1757. He entered the navy as midshipman at the age of thirteen, and served in the American war (1774—1782), receiving for his gallantry at the attack of Charleston (1775) the grade of lieutenant; but he was recalled before the end of this war, and placed under Sir Hyde Parker. He did good service in the action off the Dogger Bank (August 1781), and was rewarded with promotion to the rank of commander, being soon afterwards placed under the orders of Admiral Kempenfeldt on the Jamaica station. At the great fight between Rodney and De Grasse (12th April 1782), S. commanded the *Russell*, a line-of-battle ship, and gained much distinction by his coolness and intrepidity throughout. For his gallant capture of the French frigate *La Reunion*, with one inferior in size and equipment, he received the honour of knighthood; and in command of the *Orion*, a twenty-four, he served under Lord Bridport at the battle of l'Orient, June 23, 1793. He also took a prominent part in the battle off Cape St Vincent (February 14, 1797), and was second in command at the battle of the Nile, in which he was severely wounded. In 1801, he became a baronet, and vice-admiral of the blue; and in the same year he fought his greatest action off Cadiz (July 12), defeating a French-Spanish fleet of 10 line-of-battle and 4 frigates, with a squadron less than half their strength, and causing to the enemy a loss of 3000 men and three ships. This contest, than which, according to Admiral Nelson, 'a greater was never fought,' gained for S. the Order of the Bath, the velvet of the city of London, and the thanks of Parliament. In the Russian war, he commanded the Baltic fleet, and took or destroyed two large Russian flotillas (July 1809). In 1814, he became admiral, vice-admiral of Great Britain in 1821, was created a peer in 1831, and died at Guernsey, 336

9th October 1836. His life has been written by Sir John Ross (*Memoirs of Admiral Lord de Saumarez*, 2 vols., 1838).

SAUMUR, a town of France, on the left bank of the Loire, in the dep. of Maine-et-Loire, 28 miles south-east of Angers by railway. Bridges connect the town with a suburb on the right bank of the river. The river-side is lined with handsome quays, and there are good bridges and agreeable promenades. There is a great cavalry school, in which riding-masters for the army are trained. The hôtel de ville and the castle are prominent buildings. Rosaries of cocoa-nut shell and articles in enamel are manufactured. The trade of S. is in spirits, wines, hemp, and linen. Pop. (1872) 11,028.

S., formerly the capital of the province of Saumurais, was a stronghold of the Protestants during the reign of Henry IV., at which time it contained 25,000 inhabitants. Its prosperity was annihilated by the revocation of the Edict of Nantes, and its population reduced to a fourth. Perhaps the most striking event in the history of the town was its brilliant capture by Laroche-Jaquelein and the Vendéans, June 10, 1793. In this action, the victors, with but a slight loss, captured 60 cannon, 10,000 muskets, and 11,000 republicans.

SAUNDERSON, NICHOLAS, LL.D., a distinguished English scholar, was born at Thurstleton in Yorkshire in 1682. He became blind from small-pox at the age of twelve months, but received a good education, including instruction in the classics, which was orally communicated. His strong predilection for mathematics becoming known to his friends, attempts were made with success to instruct him in arithmetic, geometry, and algebra, by means of ingenious mechanical contrivances which it is not necessary to describe. In 1707, he came to Christ's College, Oxford, as a teacher, and there delivered a series of lectures on the Newtonian philosophy, including (strange to say) a discussion of Newton's theory of optics. Four years afterwards, he succeeded Whiston as Lucasian professor, and died 19th April 1739. A valuable and elaborate treatise on Algebra, from his pen, was published in 1740 (2 vols., 8vo), and another on Fluxions, including a commentary on some parts of Newton's *Principia*, in 1756. The mental process by which he was enabled to understand the rules of perspective, the projections of the sphere, and some of the more recondite propositions of solid geometry, seems to have been peculiar to himself, and was almost wholly unintelligible to others.

His sense of feeling was extremely acute; and he is said even to have been able to distinguish, by this sense alone, true Roman medals from counterfeits. He could judge fairly of the size of a room and of his position in it by the sound of his own footsteps, and could tell, in some inexplicable manner, when light clouds were passing across the sun's disc.

SAURIA, in the systems of Cuvier and other recent naturalists, an order of Reptiles (q. v.), having an elongated body, covered with scales or with bony plates; a more or less elongated tail; four limbs, or sometimes only two apparent, the rudimentary hind-limbs being concealed beneath the skin; the mouth always furnished with teeth; the ribs movable, rising and falling in respiration; the young issuing from the egg in a form similar to that of the mature animal.—To this order belong Crocodiles, Alligators, &c.; Chameleons, Geckos, Iguanas, Agamas, Varans, Teguxins, Lizards, Skinks, &c., numerous families, some of which contain many genera and species. Crocodiles and their allies,

being covered with bony plates instead of overlapping scales, are by some naturalists removed from amongst the Saurians, and a place nearer to the Chelonians is assigned to them. In their general form and structure, however, they correspond with Saurians, and have no resemblance to Chelonians. The recent S. are far excelled in size and in variety of strange forms by the fossil S., as the *Pleniosaurus*, *Ichthyosaurus*, &c.

SAURIN, JACQUES, a celebrated French Protestant preacher, was born at Nîmes, 6th January 1677, studied at Geneva, and was chosen minister of a Walloon church in London in 1701. But the climate of England did not agree with his delicate health; and in 1705 he settled at the Hague, where his extraordinary gift of pulpit oratory was prodigiously admired, but not by his clerical brethren, who enviously assailed him with the accusation of heresy. The ground of their charge was that S. had attributed falsehood to God. Commenting in a thesis on the conduct of Samuel (1 Sam. chap. xvi.) when about to proceed to Bethlehem to anoint David, S. had pointed out that God certainly induced the prophet to adopt such measures and such language as could not but lead King Saul to believe what was not true. He argued, however, that the 'will of God' can never command what is criminal or wrong, and that this deception—this falsehood, as men would call it—was quite innocent and permissible. S.'s logic is not perhaps quite faultless, but he at least deserves credit for not denying the existence of a moral difficulty. The dispute was carried to the synod of Hague, and S. was subjected to a series of petty persecutions that shortened his days. He died at the Hague in 1730. As a preacher, S. has often been compared with Bossuet, whom he rivals in force, if not in grace and subtlety of religious sentiment. His chief productions are: *Sermons sur divers Textes de l'Ecriture Sainte* (La Haye, 1708—1725); *Nouveaux Sermons sur la Passion* (Rotterdam, 1732); *Discours sur les Evénements les plus mémorables du V. et du N. T.* (Amst. 1720—1728); *Abrégé de la Théologie et de la Morale Chrétiennes en Forme de Catéchisme* (Amst. 1722); and *État du Christianisme en France* (La Haye, 1725).

SAUROID FISHES, a name sometimes employed to designate fishes which approach in their structure to saurian reptiles. Of recent S. F., examples are found in Bony Pikes (q. v.) and Sturgeons (q. v.). Fossil S. F. are numerous, some of them of very large size. The teeth of *Megalichthys* are nearly four inches in length, far exceeding those of any existing fish, and bony plates of the same fish have been found five inches in diameter.

SAURY PIKE (*Scomberosaurus*), a genus of fishes of the order Pharyngognathi and family Scomberosidae, having the body greatly elongated, and

Saury Pike (*Scomberosaurus*).

covered with minute scales; the head also much elongated, and the jaws produced into a long sharp

beak, as in the Garfish (q. v.); from which, however, the present genus differs in the division of the dorsal and anal fins into finlets, as in mackerels. One species (*S. saurus*) is common on the British coast. It is about fifteen inches long, the back dark-blue, the under parts white; the fins dusky-brown. It approaches the coast, and enters firths in shoals which are pursued by larger fishes, porpoises, &c., and in order to escape from these, the S. P. often leaps out of the water, or rushes along the surface for a distance of one hundred feet, scarcely dipping, or seeming to touch the water. Hence the name SKIPPER, which it very commonly receives on the British coasts. Vast shoals sometimes enter bays so that they may be taken by pailfuls, and great numbers are sometimes found among the sludge at the ebbing of the tide, in the upper parts of the Firth of Forth and elsewhere. The flesh of the S. P. is palatable.

SAUSAGE, a well-known preparation of the flesh of various animals for culinary purposes. It is made by chopping the raw meat very fine, adding salt and other flavouring materials, and often bread crumbs also, the whole forming a pasty mass. This is pressed into portions of the intestines of the animal, previously thoroughly cleaned and properly prepared. Usually, a considerable length of the intestine is filled and divided into separate sausages by constricting it with pieces of string, at short intervals. The sausages of Lucania were very celebrated amongst the Romans. They were made of fresh pork, and bacon chopped fine, with nutmeg, the stone-pine, and flavoured with cummin-seeds, pepper, bay-leaves, various pot-herbs, and the mass called garum. Italy is still celebrated for its Bologna sausages, and with many people the smoked sausages of Germany are highly prized; but when quite fresh, sausages cannot be recommended as wholesome food.

SAUSAGE-POISON. It is well known that sausages made or kept under certain unknown conditions are occasionally highly poisonous; as in Germany, where sausages form a staple article of diet, fatal cases of sausage-poisoning are by no means rare. The symptoms are slow in appearing, two or four days sometimes elapsing before they manifest themselves. The poison may be described as of the narcotico-irritant character, and is very dangerous. Dr Taylor, in his *Medical Jurisprudence*, recounts the cases of three persons who died from the effects of liver-sausages which had been made from an apparently healthy pig, slaughtered only a week before. The inspection threw no light on the cause of death. This case differs from the commonly occurring in Germany in this respect, that here the sausages were fresh, while the sausages which have proved poisonous in Germany have always been made a long time. Dr Kerner, a German physician, who has specially studied the subject, believes that the poison is an acid formed in consequence of a modified process of putrefaction; others regard it as an empyreumatic oil.

SAUSSURE, HORACE BENEDICT DE, a celebrated Swiss physicist and geologist, was born at Cully near Geneva, 17th February 1740. His education was attended to with such success that, in 1762, young S. obtained the chair of Physics and Philosophy in the university of Geneva. In 1768 he commenced the famous series of journeys which were fraught with such important consequences to science and to his own reputation; and during the course of which he visited the Jura and Vosges Mountains, those of Germany, England, Italy, Switzerland, Sicily, and the adjacent parts of the extinct craters of Auvergne, &c.; and traversed

the Alps no less than 14 times, crossing them by 8 different routes. He was the first 'traveller' who ever ascended to the summit of Mont Blanc; he camped for 17 days on the Col du Géant, and finished his Alpine achievements by the ascent of Monte Rosa in 1789. During this extensive course of travel, he made numerous observations on the minerals, physical features, botany, and meteorology of the mountain ranges he visited; and these observations were found, after having undergone a searching examination, to be as correct and valuable as they were numerous. In short, they put the science of geology for the first time on a basis of fact. The work in which they are found is entitled *Voyages dans les Alpes*, &c. (Neuchâtel, Geneva, Paris, 1779—1796, 4 vols.), and is much admired for its accurate and splendid descriptions of Alpine scenery. His observations were not made without considerable preliminary labour, for he found it necessary to improve his thermometer, hygrometer, anemometer, electrometer, anemometer, and to invent other two instruments—viz., the cyanometer and iaphanometer, before his investigations, which were conducted with much care and candour, produced satisfactory results. In 1786, S. resigned his chair; and in 1798 was appointed Professor of Natural History in the Central School of the *department of emvin* (formed on the annexation of Geneva to France); but four years afterwards, he was struck with paralysis, and after a long period of suffering, died at Geneva, 22d January 1799. Besides the great work above mentioned, he wrote numerous others, the chief of which are: *Observations sur l'ordre des Feuilles et des Pétales* (1762); *De Præcipuis errorum nostrorum Causis, ex Mentis Facultatibus riuendis* (1762); *De Electricitate* (1766); *De Aqua* (1771); *Sur l'hygrometrie* (1783), which, according to *over*, is one of the most important contributions to science in the 18th c.; and in which S. set forth his discovery of the dilatation in bulk, and diminution in specific gravity, of air charged with moisture. His 'Description of the Alps,' a portion of his great work, was published separately in 1834, at Geneva and Paris.

SAUTRĀNTIKA is the name of the second of the four great schools or systems of Buddhism, the three others being called *Vaibhāṣika*, *Mādhyamika*, and *Yogācāra*. They recognise the authority of the *Sūtras* (q. v.), but reject that of the *Abhidharma*. See C. F. Koeppen, *Die Religion des Buddha* (Berlin, 57); and W. Wassiljew, *Der Buddhismus, seine Symen, Geschichte und Literatur* (St Petersburg, 60).

SAVAGE, RICHARD, an English poet, was born in London on 16th January 1696—1697. He was the son of an illicit intercourse between Lord Rivers and the Countess of Macclesfield, which resulted in the divorce of the lady, and the declared illegitimacy of her offspring. Lord Rivers, though permitting his name to be given to the child, seems not to have concerned himself further with him at all; and the hands of his mother he met with only the most neglect. To the interference of her mother, Lady Mason, he was indebted for his education, received at the grammar-school of St Albans. Afterwards, he was apprenticed to a shoemaker in Holborn, but an accident revealing to him the secret of his birth, he quitted this obscure handicraft. Reluctantly and in vain he appealed to the tender sympathies of his mother, who declined even to see him, and withheld all acknowledgment and assistance. Failing other means of subsistence, he turned his attention to literature, and at an early age produced several comedies, which met with but little success. Somewhat more fortunate was his tragedy

of *Sir Thomas Overbury*, which, though indifferently received on the stage, with the author himself as actor of the leading part, obtained in print some approval, and put a little money in his purse. In 1727, he killed a man in a drunken tavern brawl—an offence for which he was tried, and sentenced to death. A pardon was, however, obtained for him on the intercession of the Countess of Hertford with the queen, and the details of his story becoming widely known, a strong feeling arose in his favour. Though his mother continued inexorable, and would, it was thought, have been well pleased to be rid of him by the hands of the hangman, certain of her relations interested themselves in him, and he was received into the household of Lord Tyrconnel, who allowed him £200 a year, and otherwise treated him with considerate generosity. His poem, *The Wanderer*, was now published; its success was great, and for a time the career of Savage was prosperous, and even brilliant. But it did not very long remain so. The inveterate irregularity of his habits involved him in difficulties with Lord Tyrconnel, and they parted with mutual recriminations. After this, he sunk irretrievably. Though he failed in an attempt to obtain the post of poet-laureate, a poem which he wrote to commemorate her birthday so pleased the queen, that along with 'a permission to write annually on the same subject,' she conferred on him a pension of £50 a year. This sum, which might have been to him the basis of a modest subsistence, it was his regular habit to dissipate in a week's debauchery, passing the rest of his year in what disreputable fashion he could. On the failure of his pension by the death of the queen, a subscription was set on foot, mainly through the influence of Pope, with the view of sending him to live quietly at Swansea in Wales. Thither, accordingly, he retired; but happening to visit Bristol, where he lived in the reckless manner habitual to him, he was arrested for a debt of £8, and died in prison there, on the 31st July 1743.

The poetry of S., though a few vigorous lines of it continue to be remembered, is scarcely such as of itself would have sufficed for a permanent reputation. His most powerful and finished piece is *The Bastard*, in which, when he had finally broken with the relations of his mother, he held her up to public execration. Such celebrity as still attends his name he owes, however, almost entirely to the masterly life of him by Dr Johnson, who, in the time of his own early struggles, was thrown much into his society.

SAVAGES, or WILD MEN, in Heraldry, are of frequent occurrence as supporters. They are represented naked, and also, particularly in the later

The Douglas Arms.

heraldry, are usually wreathed about the head and middle with laurel, and often furnished with a club in the exterior hand. Savages are especially

prevalent in the heraldry of Scotland. In more than one of the Douglas seals of the first half of the 15th c., the shield is borne in one hand by a single savage, who acts as sole supporter.

SAVANNAH, a city and port of Georgia, U.S., on the right bank of the Savannah River, 18 miles from its mouth, 90 miles south-west of Charleston, lat. 32° 5' N., long. 81° 5' W. It is built on a sandy plain, 40 feet above the river, with broad streets shaded by beautiful trees. Its chief edifices are the custom-house, city exchange, court-house, state arsenal, theatre, St Andrew's Hall, Oglethorpe Hall, market, hospitals, and asylums. In 1870, the exports were 53,000,000 dollars, consisting of cotton, rice, lumber, naval stores, &c. The harbour admits vessels of 14 feet draught to the wharfs; larger ships discharge and load 3 miles below. The city is surrounded by marshes and islands, and was defended by Fort Pulaski and Fort Jackson. S. was founded in 1733 by the English general, Oglethorpe. In 1776, a British fleet, attempting to take the town, was repulsed after a severe action; but it was taken in 1778, and held in 1789 against the combined French and American forces. In the war of Secession, after many unsuccessful attacks by sea, it was taken by General Sherman in February 1865. The population in 1870 was 28,235.

SAVANNAH, a river which forms the boundary between Georgia and South Carolina, U.S., rises in the Alleghanies, on the south-western border of North Carolina, and flows south-east to the Atlantic. Its length is 300 miles, navigable to Augusta.

SAVANNAHS (Span. *savana* or *sabana*), the name given by the early Spanish settlers to the great plains or prairies (q.v.) of the North American continent.

SAVARY, ANNE JEAN MARIE RENÉ, Duc de Rovigo, a French general and diplomatist, was born at Marçq, in Ardennes, 26th April 1774, entered the army as a volunteer in 1790, and served with distinction in the army of the Rhine. In 1797, he accompanied Desaix to Egypt as *chef d'escadron*, and remained under his command as long as that general lived. After the battle of Marengo (1800), Napoleon made him his aide-de-camp, and for several years employed him only in political affairs, for which he shewed an admirable capacity. In 1803, he was made general of brigade; in 1804, as commandant of the troops stationed at Vincennes, he presided at the execution of the Duc d'Enghien, an event which he is believed to have unduly hastened; and in the Prusso-Russian Austrian wars of 1806–1808, he acquired high military reputation, his victory at Ostrolenka (February 16, 1807) being really a brilliant achievement. Created Duke of Rovigo in the beginning of the following year, he was sent to Spain by the emperor, and negotiated the perfidious arrangement by which the Spanish king and his son were kidnapped. In 1810, he replaced Fouché as Minister of Police. After the fall of Napoleon, to whom he had always been passionately, and, we may add, unscrupulously devoted, he wished to accompany him to St Helena; but he was confined by the British government at Malta for seven months, when he succeeded in making his escape, and getting on board a ship, was landed at Smyrna. After experiencing several vicissitudes, he returned to Paris in 1818, and was reinstated in his titles and honours. In 1823, he removed to Rome; but at the close of 1831, he was appointed commander-in-chief of the army of Africa, and during his brief administration of affairs in Algeria, exhibited a splendid energy and generalship. But ill-health

forced him to withdraw to France in March 1833, and on the 2d of June following, he died at Paris. S.'s *Mémoires* (Par. 8 vols. 1828) are among the most curious and instructive documents relating to the period of the Empire.

SAVE, a river of the south of Austria, and an important affluent of the Danube, is formed by two upper waters, which rise in the extreme north-west of Carniola, and unite at Radmannsdorf 1560 feet above sea-level. The river then flows south-east through Carniola, passing Laibach (at which point it becomes navigable), and forming in part the boundary between Carniola and Styria, after which it enters and traverses Croatia; and at its confluence with the Unna, first touches the Turkish dominions, the northern boundary of which it continues to form throughout the remainder of its course to its junction with the Danube at Belgrade. Entire length, 644 miles. Its principal affluents are the Laibach (200 miles long), Kulpa, Unna, Bosna, and Drina.

SAVELOY, a kind of sausage common in the London shops; it only differs from pork sausage in being made of young *salted* pork, and is highly seasoned, a little saltpetre being added to give it contents a red colour.

SAVIGLIA'NO, a city of Northern Italy, in the province of Cuneo, 9 miles east of Saluzzo. It is situated on the Maira and the Grana, and is a handsome and clean town. Cloth and silk are extensively manufactured, and the country in the vicinity is productive in wines and grain. Cattle are reared in great numbers, and silk-worms are bred largely. Pop. 17,634.

SAVIGNY, FRIEDR. KARL VON, an illustrious writer on Roman jurisprudence, was descended from a French Calvinistic family, that he emigrated to Germany in 1622, to avoid religious persecution, and was born at Frankfurt, February 1779. He studied at Marburg, and took his degree in 1800, after which he commenced a series of lectures on juridical subjects, which were attended by a numerous auditory. In 1803, in his exposition of the *Digest*, with the difference existing between the text and the commentaries on the theory of possession, he proposed in 1803 his masterly treatise, *De iure Digesti*, in which the Roman law is distinguished from the extraneous elements introduced into it by Germanic law, common usage, and the misapprehensions of commentators. Its merit was soon recognised, and S. received the most advantageous offers from different universities, which he declined, in order to prosecute researches in the libraries of France and Germany, with a view to the historical development of the glosses of commentators. He was assisted in this laborious tasking by his pupil, Jakob Grimm, and his wife, a daughter of the poet Clem. Brentano. Appointed Professor of Law at the University of Landshut in 1808, he was called, two years afterwards, to Berlin, on the reorganisation of the university, and there he continued to lecture with unbroken success for a period of 32 years, the course of which he filled with various important lectures in the university and the state, and died on October 1861, at the age of 82. S. is the virtual founder of the new historical school of writers upon jurisprudence, although it is not to admit that Hugo and Schlosser had preceded him in the same direction. The essential principle of this school is, that 'law' or 'right' is not an abstract and absolute rule, manifesting the same forms in all countries, but that it is

of the forces of society, with which it changes, according to fixed laws of development that are beyond the caprices of the day. This idea, when worked out historically, has produced the most important and original results, and may even be said without exaggeration to have regenerated the science of jurisprudence. S.'s principal writings are: *Vom Berufe unserer Zeit für Gesetzgebung und Rechtswissenschaft* (Heidelb. 1815); *Geschichte des Römischen Rechts im Mittelalter* (6 vols. Heidelb. 1826—1831); *System des heutigen Römischen Rechts* (8 vols. Berl. 1840—1848); *Das Obligationenrecht* (1851—1853), and *Vermischte Schriften* (5 vols. Berl. 1850), a collection of essays which had originally appeared in the *Zeitschrift für Historische Rechtswissenschaft*, and elsewhere.

SAVINE (*Juniperus Sabina*, see JUNIPER), a low, such-branched, and very widely-spreading shrub, with very small, imbricated, evergreen leaves, which grow on mountains in the south of Europe and the East. It bears small black berries, covered with pale blue bloom. Its foliage has a strong, fetid,romatic, penetrating odour, particularly when rubbed. Its exhalations cause headache. The part of the plant used in medicine is the tops of the branches, collected in spring, and dried. Their flavour is strong, peculiar, and unpleasant, and their taste acrid, bitter, resinous, and disagreeable. The therapeutic properties of S. are due to the volatile oil which it contains. Two pounds of the tops yield out five ounces of this oil, which is limpid and nearly colourless, having the odour of the plant, and a hot acrid taste. Its composition is $C_{10}H_{16}$, being isomeric with oil of turpentine.

S. exerts a stimulating effect on the uterine organs, and is employed with much benefit in cases of menorrhoea and chlorosis, depending upon want of action in those parts. It is best given in the form of an oil, one or two minims of which may be prescribed in a pill, to be taken twice a day. This drug is often employed by the lower classes for the purpose of procuring abortion; but it ought to be generally known that if it is given in a sufficiently large dose to produce the desired effect, the life of the mother is placed in the greatest possible peril. A poisonous dose has been given for this or any other object, emetics should first be employed to remove any of the drug that may remain in the stomach, after which opiates and demulcents should be prescribed, and a general cooling and lowering treatment adopted. S. in the form of ointment is chiefly used as an external application; with the view of keeping up the discharge from a blistered surface. The ointment cannot, however, be kept long without losing its properties.

SAVINGS-BANKS. The application of the banking-system to the middle and humbler classes of society was commenced by individual exertions long before the legislature took cognizance of the matter. In 1799, the Rev. J. Smith, rector of Andover in Bucks, as a means of inducing habits of prudence and frugality among his parishioners, resolved, with two other inhabitants, to receive weekly any sum not less than twopence; and if the amount were not touched before the next following Christmas, to add one-third to it as a bonus or encouragement. In 1810, the Rev. H. Duncan established a Parish Bank Friendly Society at Hawell (Scotland), more resembling a modern savings-bank. A minute account of its organization and mode of operation drew so much attention to it, that, by the year 1817, there were 78 establishments resembling it in the United Kingdom. The first savings-banks acts were passed in 1817, for England and Wales, and one for Ireland.

A fund, called the Fund for the Banks for Savings, was opened with the National Debt Commissioners; and into this fund were to be placed all savings-banks deposits as soon as they reached £50. On these sums the National Debt Commissioners gave £4, 11s. 3d. per cent. interest (3d. per cent. per diem). The managers of the savings-banks in most cases allowed the depositors 4 per cent., the difference being applied to the working expenses.

This, the fundamental statute on the subject, has been modified and extended in many ways since. In 1824, as it was found that the benefits of the savings-banks system were reaped by persons for whom it was not intended, an act was passed declaring that the deposits in the first year should not exceed £50; that those in subsequent years should not exceed £30; that no interest would be allowed on any excess beyond £200; and that no person would be allowed to make deposits at more than one savings-bank. In 1828, an act was passed to give greater security to the depositors. The rules drawn up by the trustees and managers of all savings-banks were to be submitted to a barrister appointed by the National Debt Commissioners, and without his approval no savings-bank could commence or continue operations. The justices of the peace had also a veto in the matter; and the clerk of the peace was to keep a certified copy of the approved rules and regulations. The trustees were to receive £3, 16s. 0½d. per cent. interest (2½d. per cent. per diem), and were to pay the depositors not exceeding £3, 8s. 5½d. interest (2½d. per cent. per diem). No depositor was to deposit more than £150; but compound interest might accumulate until the total reached £200. Friendly societies and charitable institutions were, however, permitted to invest to the amount of £300.

In 1833, an act was passed to enable savings-banks to manage the granting of small deferred annuities, to be paid for by weekly, monthly, quarterly, or yearly instalments. In 1835, another act extended the operation of the statutes of 1828 and 1833 to Scotland, and enabled existing savings-banks to conform to the stipulations without a necessity for reorganisation.

In 1844, a new act made extensive changes in the savings-banks system, the chief items of which may thus be summarised: Interest allowed by the commissioners to trustees to be reduced to £3, 5s. 0½d. per cent., and to depositors to £3, 0s. 10½d. per cent. (2d. per diem); every depositor's book to be sent once a year to his savings-bank for examination; the extent of the liability of trustees, managers, actuaries, and cashiers exactly defined; arrangements for making deposits in trust for other persons; annuities under the act of 1833 not to exceed £30 for any one person, but separate annuities to that amount may be granted to a husband and wife; deposits made by a married woman may be returned to her, unless the husband give notice to the contrary; rules laid down concerning the inheritance of the deposits of intestate and illegitimate persons; payments to the relations of intestate depositors to be made to the next of kin according to the law of Scotland, if in that country. An act passed in 1848 placed a limit on the liability of trustees of savings-banks in Ireland. In 1853, an act placed the maximum and minimum of savings-banks annuities at £30 and £4 respectively; and allowed a husband and wife to purchase a joint annuity, although one of them may have already had an annuity of the full amount. Another act in 1860 authorised the National Debt Commissioners to invest the moneys received by them from savings-banks in any kind of stock, debenture, or other security that has received parliamentary sanction; and required them

direct allusions, was no less antagonistic to the established system of the government, than to the worldly and irreligious manners of the age; the visions and predictions ascribed to him had quite as much of political applicability as of religious significance; and thus, to the aristocratic adherents of the Medici, S. early became an object of suspicion, if not of antipathy and dread. It is said by Pico de Mirandola, that he refused to grant absolution to Lorenzo, when the latter lay dying in 1492; but the statement does not accord with Poliziano's account of his patron's death. Through all this time, however, S.'s relations with the church were, if not of harmony, at least not of antagonism; and when, in the year 1493, a reform of the Dominican order in Tuscany was proposed under his auspices, it was approved by the pope, and S. was named the first general vicar. About this time, however, his preaching had assumed a directly political character, and the predictions and denunciations which formed the staple of many of his discourses, pointed plainly to a political revolution in Florence and in Italy, as the divinely ordained means for the regeneration of religion and morality. In one of his discourses, he pointed plainly to the advent of the French under Charles VIII.; and when this prediction was fulfilled by the triumphant appearance of the French expedition, S. was one of a deputation of Florentines to welcome Charles VIII. as the saviour of Italy, and to invite him to Florence. Very soon, however, the French were compelled to leave Florence, and a republic was established, of which S. became, although without political functions, the guiding and animating spirit, his party, who were popularly called *Piagnoni*, or 'Weepers,' from the penitential character which they professed, being completely in the ascendant. It was during this brief tenure of influence that S. displayed to the fullest extent, both the extraordinary powers of his genius, and the full extravagance of the theories to which his enthusiastic asceticism impelled him. The republic of Florence was to be the model of a Christian commonwealth, of which God Himself was the chief ruler, and His Gospel the sovereign law; and thus the most stringent enactments were made for the repression of vice, and of all the sinful follies by which it is fomented and maintained. All the haunts of debauchery were suppressed; gambling in all its forms was prohibited; the vanities of dress were restrained by sumptuary enactments; and, under the impulse of the popular enthusiasm which the enthusiasm of the prophet engendered, women flocked in troops to the public square to fling down their costliest ornaments; and gay gallants and grave scholars destroyed, in one common *auto da fe* before the gates of the cathedral, whole hecatombs of the amatory poetry or licentious fiction of the day, in conjunction with the elegant paganism or unconcealed immorality of the classic period. Meanwhile, the extremes of his rigorism; the violence of his denunciations, which did not spare even the pope himself; the assumption by him, or attribution to him, of a supernatural gift of prophecy; and the extravagant interpretation of the Scripture, and especially of the Apocalypse, by which he sought to maintain his views, drew upon him the displeasure of Rome. He was cited, in the year 1495, to answer a charge of heresy at Rome; and on his failing to appear, he was forbidden to preach; the brief by which the Florentine branch of his order had been made independent, was revoked; and he was again summoned to Rome. Once again S. disregarded this order. But his domestic difficulties now began to deepen. The measures of the new republic proved impracticable. The party of the Medici, called 'Arrabbiati'

(Enraged), began to recover ground. A conspiracy for the recall of the exiled House was formed; and although, for the time, it failed of success, and some of the conspirators were condemned and executed, yet this very rigour served to hasten the reaction. The execution of these conspirators was a direct violation of one of S.'s own laws, and it tended to direct the popular sympathy in their favour. At the critical point of the struggle of parties came, in 1497, a sentence of excommunication from Rome against Savonarola. S. openly declared the sentence invalid, because unjust, and refused to hold himself bound by it. In the following year, however, 1498, when the new elections took place, the party opposed to S., the Arrabbiati, came into power. He was ordered to desist from preaching; and the struggle was brought to a crisis by the concurrent denunciations of a preacher of the Franciscan order, long an antagonist of S., Francesco da Puglia. In the excited state of the popular mind thus produced, an appeal was made by both of the contending parties to the interposition of divine providence in the ordeal of fire. But at the moment when the trial was to have come off, difficulties were originated by the party of S., and nothing was actually done. The result of this was to destroy, with the populace, the prestige of S.'s reputation, and to produce a complete revulsion of public feeling. In the midst of this reaction, he was cited before the council, and brought to trial for misleading the people by false prophecies. He denied the charge, but being threatened with torture, he is said to have made a confession, which, however, his friends say was garbled, if not utterly falsified. He declared guilty of heresy and of seditious texts. The acts of the trial were sent to Rome, where the sentence was confirmed; and he, with two of his order, were given up to the secular power. An effort was made to procure a remission of the capital sentence which was passed upon them, in vain; and on May 23, 1498, this extraordinary man, with his two companions, F. Domenico Pescia and Silvestro Maruffi, were executed, their bodies burned by the executioner. They professing their adherence to the Catholic Church, and humbly accepting the last absolution from a papal commissary; and it is still a question among Catholics, whether S. is to be regarded in the light of a confessor of the truth, or of a fanatical runner of the movement which so soon reached its full development in the Reformation. The works of S. are very numerous. They were all written either in Latin or in Italian, but have for the most part been translated into French, German, Spanish, and other languages. His works in Latin are: (1.) *On the Simplicity of the Human Soul*; (2.) *Triumph of the Cross*; (3.) *A Dialogue of the Soul and the Soul*; (4.) *A Fourfold Exposition of the Lord's Prayer*; (5.) *On the Perfection of the Soul's Life*. Most of them were translated contemporaneously into Italian, and some even by S. himself. His principal Italian works are: *A Treatise on Humility*, *On the Love of Jesus Christ*, *On the Love of Widowhood*, *Two Treatises on Prayer*, *On Christian Living* (together with a work of almost the same which he wrote while in prison, and at the desire of his jailor), *On the Mysteries of the Mass*, and several other doctrinal and ascetical treatises. No collected edition of his sermons has been published, and his correspondence also has for the most part disappeared; but the works which survive sufficiently illustrate the peculiarities of his genius, and the stern and almost fierce enthusiasm which was the secret of his influence on that corrupted but yet cultivated age.—See Madden, *Life of Savonarola* (2 vols. 8vo, 1854); Abbé Caste-

Histoire de Fra Hieron Savonarola (Paris, 1842); *Reverè i Piagnoni e gli Arrabbiati al Tempo de Savonarola* (2 vols., Milan, 1843).

SAVONETTES, soap of fine quality, perfumed and made into balls or other shapes, for use at the toilet.

SAVORY (*Satureja*), a genus of plants of the natural order *Labiata*, nearly allied to Thyme (*Thymus*), and differing from it in the regularly 5-toothed or 5-cleft calyx, and the stamens bent together into an arch under the upper lip of the corolla. The species are herbaceous and half-shrubby plants, all natives of the south of Europe and the East. They have narrow, linear-lanceolate, entire leaves, with resinous dots, and short, axillary, little corymba. The COMMON S., or SUMMER S. (*S. hortensis*), is commonly cultivated in kitchen-gardens for flavouring dishes. It is an annual plant, $\frac{1}{2}$ –1 foot high, with leaves not prickly pointed, and lilac or white flowers; has a strong and agreeable aromatic smell, and an aromatic pungent taste, and is in common use both fresh and dried for flavouring dishes, and especially for flavouring beans. It is stomachic and tonic.—WINTER S. (*S. montana*) is used exactly in the same way. It is a half-shrubby plant, with prickly-pointed leaves and larger flowers. Its taste is pungently aromatic.—Summer S. is propagated by seed; winter S. by slips and cuttings.

SAVOY, a cultivated variety of CABBAGE (q. v.), forming a large close head like the true cabbages, but having wrinkled leaves. A number of sub-varieties are in cultivation. The mode of cultivation and the uses are the same as those of cabbage. Savoy is much cultivated for winter use; they require a light rich soil.

SAVOY, formerly a duchy belonging to the kingdom of Sardinia (q. v.), now incorporated with France, is bounded on the N. and E. by Switzerland, E. and S. by Piedmont, and W. by the French departments of Isère and Ain. While an Italian duchy, it was politically divided into seven provinces, a division which exhibited the successive steps of its acquisition by the House of Savoy; but since its annexation to France this division has been modified, though the change has been little more than nominal. It is now separated into two departments: first, SAVOIE, or CHAMBERY, the southern part of S., with an area of 2282 sq. m., and a pop. of 267,958, which is divided into four arrondissements—Chambery (old province of *Chambery*), Albertville (*Alta-Savoia*), Moutiers (*Tarantasia*), and Saint Jean de Maurienne (*Maurienne*)—and as Chambery for its capital; secondly, HAUTE-SAVOIE, or CONFLANS, the northern part of S., which has an area of 1319 sq. m., with a pop. of 73,027, and is divided into four arrondissements—Bonneville (*Fossigny* or *Faucigny*), Thonon (*Ciablèse* or *Chablais*), Annecy and St Julien (*Genevève*)—Annecy being the capital. The two departments resemble each other so much in all respects, that they may be described together.

S. is the most elevated tract in Europe, and is mostly covered with mountains, which break up the country into a number of valleys, each watered by its own snow-fed torrent or stream. The highest elevation of S. is the summit of Mont Blanc (q. v.), and the lowest is the bank of the Rhone at Saint-enix d'Aoste, 670 feet above sea-level. The Graian Alps run along the eastern boundary of S., and form a natural barrier between it and Piedmont, several peaks or gorges affording means of communication between the two countries; from this range, the mountains gradually decrease in height towards the valley of the Rhone, which is on the western boundary.

S. (especially Haute-Savoie) is extremely picturesque, and within a comparatively limited space, exhibits at once the curious, the beautiful, the grand, and the wild and forbidding phases of natural scenery. There we have the lakes of Geneva, Annecy (9 miles by $1\frac{1}{2}$), Aiguebellette, each perfect in its own style of beauty; the subterranean lakes of Bauge, the cascades of Sallanches and Bout-du-monde, the intermittent springs of Pigros and Haute-Combe, the grottoes of Balme, Bauge, and Sallanches, the hot springs of Aix-le-bains (near Chambery), of Saint Gervais, Bride, Echaillon, and others; the smiling valleys of Chambery, Favergue, Maglan, and Albertville; the glaciers of Chamounix, Buet, and Upper Tarantasia; the wooded mountain-sides of Ciablèse, the bare rugged peaks which surround Mont Blanc, the frowning gorge of Challes, and the wild and savage glens and dells of Maurienne. Tourists consequently flock in great numbers to S., the robust to gratify their love of sight-seeing, and the invalids to benefit by the thermal springs, which are much esteemed.

The whole of the country is drained by streams which flow either into Lake Leman (the northern boundary) or the Rhone. Chief of the former is the Drance, which traverses Chablais; among the latter are the Arve, which drains the Chamounix valley, the Usse, the Fier, the Laisse, the Guier, and the Isère. The geology of S. is marked by the presence of three distinct ranges, exhibiting respectively the primary, transition, and secondary series of rocks with great completeness; and the depth of the crevasses, the height of the mountains, inversions of strata, débris on the mountain-sides, afford excellent opportunities for a thorough study of the constitution and elements of the earth's crust.

The whole of S. is broken up into a multitude of small estates, and the country is, as a consequence, most carefully cultivated, some of the fertile valleys resembling a continuous garden abounding in flowers and fruits. The ground suitable for cultivation being very limited, the enterprising natives have made extraordinary efforts to increase it by constructing line above line of parapets along the steep mountain-sides, and by filling in earth behind, forming long and narrow terraces, on which, if they can succeed in growing two rows of vines, they consider themselves well rewarded for their labour. These terraces are most common in the hilly districts of Tarantasia and Maurienne.

The climate of S. is in general cold, the winters are long and severe, and the summers frequently follow without an intermediate spring. Yet S. can boast of the vegetation of warm countries, as well as of that of higher latitudes; the vine is found growing almost to the edges of the glaciers, and cereals and fruits of various sorts are produced in great perfection. The pasturage is rich and abundant, and mulberry trees are largely planted. Although it is essentially an agricultural country, the industrial arts are not unrepresented; fabrics of cotton, printed calico and gauze, stockings, felt-hats, woollen cloth, are manufactured in various localities; and tanneries, breweries, distilleries, glass-works, potteries, &c., are occasionally met with. The chief occupation, however, is the breeding of cattle, horses, and mules, all of which are much esteemed, and fetch good prices; and bees and silkworms are tended as a source both of amusement and profit.

S. is rich in minerals—silver, iron, copper, antimony, manganese, lead, zinc, asphalt, marble, granite, gypsum, sulphur, and salt. The principal mines are the spathic iron-mine of Saint Georges d'Hurtieres, and the lead-mine of Macot. Coal is found in Maurienne.

The exports consist of the surplussage of these

SAVOY—SAVOY CONFERENCE.

products, and also of cheese, hemp, silk both raw and spun, and wood of various sorts. S. is, with the exception of Bavaria, the only country of Europe in which advanced education is given gratuitously, there being within the country 14 colleges for this purpose. Ordinary education is also well provided for, as more than 1200 schools exist, nearly the whole of which are supported on old foundations.

The Savoyards are honest, intelligent, religious, hospitable, and enthusiastically patriotic, even to a greater extent than the Swiss. More than 20,000 of them expatriate themselves annually for the purpose of pursuing various callings, but the greater portion return early in summer, while others wait till they have amassed wealth sufficient for the rest of their lives.

SAVOY, HOUSE OF. The small territory of Savoy, formed a part of ancient Gaul, and after the decline of the Roman power, was seized by the Burgundians (407 A. D.), and along with Burgundy, passed under the Franks (534). On the breaking up of the Frankish empire, Savoy was joined to *Transjurane Burgundy*, and along with that kingdom was united to *Cisjurane Burgundy*, or Arles. On the accession of the last king of Arles to the imperial throne as Conrad II., the great lords of North-western Italy, such as the lords of Suza, Chablais, Maurienne, and Turin, became vassals direct of the empire. The counts of Maurienne, the ancestors of the House of S., are generally believed by most historians who have investigated their genealogy to have descended directly in the male line from a son of Wittekind the Great, the last independent king of the Saxons; and COUNT HUMBERT, the *White-handed*, was the first of the family who, by the addition of Chablais and Valais (grants from the Emperor Conrad the Salic) to his hereditary lordship of Maurienne, rose to high position among the princes of Northern Italy. One of his descendants, HUMBERT II. (1078—1103), succeeded to the marquisate of Suza (which included the greater part of Piedmont), and further increased his little territory by the conquest of Tarantasia. The family now commenced to form alliances with the royal Houses of France, Portugal, England, Naples, Spain, and Germany, which added greatly to its political importance. AMADEUS III. (1103—1149) received from the Emperor Henry V. the title of COUNT OF SAVOY (1111), and his grandson, THOMAS I. (1188—1233), obtained important accessions in Chambery, Turin, the country of Vaud, and many other lordships. Count Thomas was the initiator of the policy so long and successfully adopted by his successors, 'of preserving armed neutrality in all contests between France and the Empire, and of vigorously supporting the Empire against the papacy.' From this time, the counts of Savoy became the arbiters of all quarrels in North, and occasionally in South Italy, and their bravery in the field, and keen political sagacity,* increased at once their political influence and their territorial jurisdiction. After the death of Count Boniface in 1263, without heirs, his uncle, PIETRO, the Earl of Richmond and lord of Essex, usurped the crown; but in 1285, the rightful heir, AMADEUS V. (1285—1323), the grandson of Pietro's elder brother, obtained the succession; and his grant to his brother THOMAS of the principality of Piedmont as a hereditary fief, founded the two lines of Savoy and Piedmont, which continued to rule over their respective territories till, on the latter becoming extinct in 1418, Piedmont reverted to the elder line. (See AMADEUS V., VI.,

and VIII.) AMADEUS VIII. was the first DUKE OF SAVOY, being so created by the Emperor Sigismund in 1416. CHARLES I. (1482—1489) obtained from Charlotte of Lusignan, queen of Cyprus, the transference of her rights, and from this date (1485) the dukes of Savoy also claimed to be kings of Cyprus and Jerusalem. The elder male line becoming extinct in 1496, the next collateral heir was PHILIBERT II. (1496—1504) and CHARLES III. (1504—1553); but the latter, having sided with Charles V. against Francis I. of France, was deprived of the duchy of Savoy in 1533, the counts of Valais and Geneva placed themselves under the protection of Switzerland, and in 1536 the country of Vaud was seized by the people of Bern. By his son, PHILIBERT EMMANUEL, who was the Spanish governor in the Netherlands, succeeded, at the peace of Cateau-Cambresis (1559), in obtaining repossession of Savoy. It was this duke who attempted to convert the Vaudois (q. v.), and who founded the very important silk-production in Piedmont, besides, to the utmost of his power, encouraging the prosecution and development of other branches of industry. He re-annexed (1576) the principality of Oneglia, and conquered the county of Tende. His successor, CHARLES EMMANUEL I. (1580—1630), was celebrated as a scholar, statesman, and warrior, but he was cursed with an inordinate ambition, which involved him in unfortunate contests with Geneva (a former town of Savoy, of which he wished to regain possession), with the French, who in revenge took possession of his dominions, and with the Spaniards. By two sons, VICTOR AMADEUS I. (q. v.) (1630—1678) and Thomas, were the respective founders of the two lines of Savoy and Savoy-Carignan. VICTOR AMADEUS speedily regained the dominions which his father had lost; and with the consent of France added to them Montferrat, Alba, and some other places, relinquishing Pignerol, La Perouse, Aosta, and Lucerne to the French. As generalissimo of the French army in Italy, he gained two victories over the Spaniards, but died soon after. His grandson, VICTOR AMADEUS II. (1675—1730), was one of the claimants for the Spanish throne on the extinction of the Spanish-Hapsburg dynasty (see STRUCK WAR OF THE SPANISH); and by his adroit policy the contest between the Hapsburgs and Bourbons for the possession of this crown, he succeeded in obtaining extensive additions to his little territory, the chief of these being Alessandria, Val-d'Aosta, and other portions of the Milanese, the island of Sicily in 1713, and along with this latter the throne of Sardinia. He and his descendants were also recognized as the legitimate heirs of the Spanish throne, but the Bourbon dynasty ever became extinct. By 1720 he was compelled to surrender Sicily to Austria in exchange for the island of Sardinia, which, with Savoy, Piedmont, and his other continental possessions, was then erected into the KINGDOM OF SARDINIA (q. v.).

SAVOY CONFERENCE, the name given to an ecclesiastical conference held in 1861 at the Savoy Palace (so called because built in 1245 by Peter Earl of Savoy and Richmond [see AMADY] burned by Wat Tyler in 1381, it was rebuilt and endowed in 1506 as an hospital for poor persons between the Episcopalian and Presbyterian divisions with the view of ascertaining what concessions would satisfy the latter, and thereby lead to perfect and entire unity and uniformity throughout the nation. During the rule of the Puritans—Cromwell, the Church of England had been in a very anomalous condition. Most of the clergy who held office during the early period of the Civil Wars were strong royalists, and either were ejected or fled, when the cause of the parliament

* It is a remarkable fact, in connection with the history of this family, that they have numbered among them more great warriors and politicians than any other royal House of Europe.

triumphed. Their places had been supplied in many cases by zealous Presbyterians—a rather numerous body in England at that time, and thus it happened at the restoration of Charles II. that a considerable section of the ministers *within the church* were hostile to the re-introduction of Episcopalian order and practice. Aware of this feeling, yet desirous of not adopting severe measures, if such could possibly be avoided, the king issued letters-patent dated 25th March appointing twelve bishops, with nine clergymen as assistants on the side of the Episcopalian Church, with an equal number of Presbyterian divines, 'to advise upon and review the *Book of Common Prayer*.' Among the Episcopalian commissioners were Frewen, Archbishop of York, Sheldon, Bishop of London, Gauden of Exeter, Reynolds of Norwich, &c.: among their assistants, Dr Peter Heylin, Dr John Pearson, and Dr Thomas Pierce. The most notable representatives of the Presbyterian party were Richard Baxter, Dr John Wallis (then Savilian Professor of Geometry at Oxford), Edmund Calamy, William Spurstow, and Matthew Newcomen. The Conference (which lasted four months) was opened on the 13th of April. The Presbyterians (according to Burnett) demanded that Archbishop Usher's scheme of a 'reduced episcopacy,' in which the elements of the Scotch system of presbyteries, synods, and general assemblies were combined with distinctions of ecclesiastical ranks, should be made the basis to begin with; that responses should be given up; that the prayers of the Litany should be combined into one; that no sermons should be taken out of the Apocrypha; that psalms read in the daily service should be according to the new translation; that the term regeneration (among others) should be struck out of the spiritual service; and that the use of the surplice, of the cross in baptism, of godfathers as sponsors, and the holy days, should be abolished. They were told in reply that the commission had no authority to discuss questions affecting the government of the church, such as were contained in Archbishop Usher's scheme; whereupon they proceeded to consider the minor points, such as the alterations of the Liturgy. Baxter, with the consent of his party, drew up a 'Reformed Liturgy' which the Episcopalian commissioners would not look at, considering a wholesale rejection of the older one *ultra vires* their part. Finally, the parties separated without arriving at any conclusion; and this fruitless attempt at 'comprehension' was followed in 1662 by the famous 'Act of Uniformity,' the result of which was that 2000 clergymen were forced to abandon their livings in the Church of England.

SAVU ISLANDS lie in the Indian Ocean, the south-east of the Sandalwood Island. Pop. 1000. The islands of the group are small, except Savu, in 121° 45'—122° 7' E. long., and 10° 25'—10° 36' S. lat., with an area of 237 sq. miles. It is very fertile and healthy, the thermometer ranging from 76° to 88° F., by day, and 68° to 70° by night. The products are those usual in the Indian Archipelago. Horses and excellent tobacco are exported to Timor.

There are several rajahs who are under the Netherlands Resident at Timor, a postholder being stationed at Seba, where there is good anchorage. The Savunese belong to the Malay race. Their religion is a traditional heathenism, in which the offering of sacrifices of dogs is frequently practised.

SAW, one of the most important tools used in working timber. It usually consists of a long strip of thin steel, with one edge cut into a continuous series of sharp teeth. Notwithstanding the great simplicity of the principle upon which the saw is

made, it admits of great variation, and modern carpentry has brought into use a great many kinds of saws adapted to different purposes. The most common is the *Hand-saw* (fig. 1), in general use. For this the blade is broader at one end than the other, and a wooden handle is fixed to the broader end, without which it could not be used. This kind of saw is varied by the manner in which the teeth are cut and set, and in the shape and width of the blade, as in *Compass* or *Key Saws* for cutting small holes (fig. 2). Other kinds of hand-saws, such as the *Back-saw* (fig. 3) and the *Tenon-saw* (fig. 4), have straight blades, and the back is guarded and

strengthened by a piece of brass or iron bent over it. The *Bow-saw* (fig. 5) is used for a variety of purposes; the blade, which is always thin, is stretched like a bowstring to an iron frame. The *Frame-saw* (fig. 6), chiefly used in sawpits and mills for cutting timber longitudinally, is similar in shape to the ordinary hand-saw, but much larger, with holes at each end, for fixing it in the frame by which it is moved up and down. For cutting timber transversely, the *Cross-cut-saw* (fig. 7) is used; this differs not only in shape, but in the set of the teeth

Fig. 8.—Circular-saw.

from other saws. Within the present century, the *Circular-saw* (fig. 8) has come into universal use wherever machinery can be had for working it. It

SAWDUST—SAWFLY.

is generally so fitted as to be worked under a flat bench, a part only of the blade projecting through a narrow slit cut in the top of the bench. It is made to revolve with great rapidity, and the wood resting on the bench is pushed against the saw in the direction it is intended to be cut. The rapidity with which wood is cut by the circular-saw is truly marvellous. To save space, several forms of teeth are shewn in the figure, but each saw has but one kind. The *Ribbon-saw* is comparatively a new invention. It consists of a very long band—or web, as it is called—of steel, usually very narrow, and with finely-cut teeth. The two ends are joined together so as to form an endless band, which is passed over two revolving drums, one above, and the other below the working-bench, through holes in which the saw passes. With this work, the finest patterns in open work may be cut out with great ease and rapidity. Numerous other kinds of saws are in use, but these are the chief.

SAWDUST. The waste made by sawing timber, formerly of little or no use, has now become a material of some value in localities where it can be applied. Its most interesting application is one very recently patented by Messrs Dale & Co. of Manchester, whereby it is converted into oxalic acid, and with so much success as to have nearly or altogether displaced every other method of making that chemical. The process is very simple. The sawdust is first saturated with a concentrated solution of soda and potash in the proportion of two of the former to one of the latter; it is then placed in shallow iron pans, under which flues run from a furnace, whereby the iron pans are made hot, and the saturated sawdust runs into a semi-fluid, pasty state. It is stirred about actively with rakes, so as to bring it all in contact with the heated surface of the iron, and to granulate it for the succeeding operations. It is next placed in similar pans, only slightly heated, by which it is dried. In this state it is oxalate of soda mixed with potash. It is then placed on the bed of a filter, and a solution of soda is allowed to percolate through it, which carries with it all the potash, leaving it tolerably pure oxalate of soda. It is then transferred to a tank, in which it is mingled with a thin milk of lime, by which it is decomposed, the lime combining with the acid to form oxalate of lime, and the soda being set free. Lastly, the oxalate of lime is put into a leaden cistern, and sulphuric acid is poured in; this takes up the lime, and sets free the oxalic acid, which readily crystallises on the sides of the leaden cistern, or on pieces of wood placed on purpose. So rapid and cheap is this method, compared with that formerly in use, that several extensive old manufacturing have been shut up since the article on **OXALIC ACID** was written, being unable to compete with the patent process.

Another interesting use of the sawdust of hard woods, such as rosewood, ebony, &c., is that recently made known in France under the name of *Bois-durci*. The various kinds of sawdust used are reduced to fine powder, and mixed with blood into a paste; other materials are doubtless added, for when pressed into moulds it is jet black, and receives the most beautiful impressions. Messrs Latry, Senior, & Co. of Paris produce some very beautiful medallions and other small articles in this material.

SAWFISH (*Pristis*), a genus of cartilaginous fishes, constituting the family *Pristidae*, which is ranked with the Rays (q. v.), although the elongated form of the body agrees rather with that of the sharks. In a number of anatomical characters, however, the sawfishes differ from sharks, and agree

with rays, and conspicuously in the position of the gill-openings, which are not on the sides, as in sharks, but on the under-surface, as in rays. The mouth is on the under surface of the head, and is furnished with pavement-like teeth, adapted for crushing. But the S. is particularly remarkable for the elongation of the snout into a flat bony sword, armed on each edge with about twenty large bony spines or teeth; a most formidable weapon.

Sawfish (*Pristis antiquorum*).

which it seems to make use for killing prey, even amongst shoals of fishes, and alaying them right and left. Whales are said to be sometimes killed by sawfishes, and the saw has been sometimes driven into the hull of a ship. There are six or seven known species of S., and they are distributed over the whole world. The Common S. (*P. antiquorum*) was known to the ancients, being found in the Mediterranean. It is a very widely distributed fish, being found both in polar and tropical seas. It sometimes attains the length of eighteen feet, including the saw. Sawfishes are seldom seen near the shore, and no species is reckoned among British fishes.

SAWFLY (*Tenthredo*), a Linnaean genus of saws of the order *Hymenoptera*, now divided into two genera, and constituting a family of which there are many species. They derive their name from the saw-like organ which the females use for boring into plants, laying an egg in each hole. The hole becomes filled with a frothy liquid, and sometimes a gall-like swelling is formed, within which the larva resides. The larvae of many sawflies, however,

Turnip Sawfly (*Athalia spinarum*), in its various stages of Transformation.

in no such nests, but feed on foliage, like caterpillars, which they very much resemble. One of the most common species of gooseberry 'caterpillar' is the larva of a S. (*Nematus ribesii*). Sawflies have a cylindrical, and so united to the thorax, that the distinction is not easily perceived.

vary much in the antennæ. Both pairs of wings are divided by nervures into numerous cells. Among the more notable species is the CORN S. (*Cephus pygmaeus*), which, in its perfect state, abounds on umbelliferous flowers, a shining black insect, marked with yellow, the abdomen elongated. The larva consumes the inside of the straw of corn, and descending to the base of the straw, cuts it down level with the ground.—Another important species is the TURNIP S. (*Athalia spinarum*), reddish, spotted with black; the larva nearly black, and known by the names of *Black Jack* and *Nigger*. The Turnip S. is sometimes very troublesome and destructive for a year or two, and then almost completely disappears for a number of years. It has sometimes been very destructive to the turnip-crops of Britain.—The S. of the Pine (*Lophyrus pini*) is a common British species, and sometimes, although not very often, strips pine and fir trees of their leaves.

SAW-MILL. Within the present century, the art of working saws by machinery has been invented, and large mills for cutting up timber by means of large saws worked by machinery, are to be found in most civilised countries. They are worked both by steam and water-power, and in Holland, wind-mills are made to work sawing machinery. The arrangements of a saw-mill are very simple: they consist of a fixed horizontal frame, with rollers at short intervals, upon which the tree or log of timber is laid; at the end of this, another frame is placed in a vertical position; it contains as many saws as are needed side by side as it is proposed to cut planks out of the log, and they are set as far apart as the desired thickness of the planks or boards. A rapid up-and-down motion is given to these saws by the machinery, and at the same time the log is rolled forward on the rollers by the same power, so that the log is kept constantly up to the saws. In this way, a large tree or log of wood may be cut into many planks in much less time than was formerly required by laborious hand-labour to cut one single plank.

The circular-saw is also much used in mills for cutting planks and boards into pieces of almost any size.

SAXE, HERMANN MAURICE, COUNT OF, one of the greatest warriors of the 18th c., was the natural son of Augustus III. (q. v.), Elector of Saxony and King of Poland, and the Countess Aurora von Nigmark, and was born at Goslar, 28th October 1696. When only twelve years of age, he ran off from home, made his way to Flanders, joined the army of Marlborough, and took part in the capture of Lille and the siege of Tournay. With a boyish love of change, he joined the Russo-Polish army near Stralsund (1711), and after the taking of Riga, returned to Dresden, where his mother induced him, in 1714, to espouse a young and amiable man heiress. In the two following years, he took part in the civil war then raging in Poland; having quarrelled with his father's favourite sister, he returned to Dresden, where the well-founded jealousy of his wife made his life sufficiently disagreeable. Obtaining the annulment of marriage, and a pension from his father, he came to Paris in 1720, where he devoted himself for some years to the study of military tactics, and originated the development of an entirely novel system of manoeuvres, which was highly spoken of by the Chevalier de Saxe, the celebrated military engineer. In 1726, he was elected Duke of Courland, and for a time retained himself in his new possession against the Russians and Poles, but was compelled to return to France in the following year. Joining the

army on the Rhine, under the Duke of Berwick, he signalled himself at the siege of Philippsburg (1734), and decided the battle of Ettingen by a desperate charge at the head of a division of grenadiers. For these services, he was made a lieutenant-general in 1736; and on the breaking out of the war of the Austrian Succession, he obtained the command of the left wing of the army which was appointed to invade Bohemia, and took the strongly-fortified town of Prague by storm with marvellous celerity. The capture of Egra was similarly effected a few days afterwards, and the rest of the campaign shewed that his abilities in the field were not inferior to his skill against fortifications. In 1744, he was made a marshal of France, and appointed to command the French army in Flanders, and on this occasion he gave decisive proofs of the soundness and superiority of his new system of tactics, by reducing to inaction an enemy much superior in number, and taking from him, almost before his face, various important fortresses. The following year was for him more glorious still; his army was reinforced, and though so ill with dropsy that he had to submit to tapping (15th April), he laid siege to Tournay on the 22d, and on the advance of the Duke of Cumberland to its relief, took up a position at Fontenoy, and awaited attack. He was assailed on the 11th May, and the desperate valour of the English for a time bore down everything before them; but Saxe sped about in his litter, encouraging his troops, and when the critical moment came, the fire of his artillery disorganised the English, and a charge of the French completed the victory. Four months afterwards, every one of the numerous strong fortresses of Belgium was in his hands. In 1746, Saxe, by a series of able manoeuvres, threw back the allies on the right bank of the Maese, and gained (11th October) the brilliant victory of Raucoux, for which he was rewarded with the title of marshal-general, an honour which only Turenne had previously obtained. For the third time, at Laufeldt (2d July 1747), the victor of Culloden suffered complete defeat at the hands of Saxe, whose favourite system of tactics was again brought into full play; and the brilliant capture of Bergen-op-zoom brought the allies to think of peace. The Dutch, however, were still disposed to hold out, till the capture of Maestricht (1748) destroyed their hopes, and the peace of Aix-la-Chapelle followed. Saxe had previously carried on a correspondence with the great Frederick of Prussia, and he now took occasion to visit him at Berlin, experiencing the most brilliant reception. In the following year, Frederick wrote to Voltaire: 'I have seen the hero of France, the Turenne of Louis XV.'s time. I have received much instruction from his discourse on the art of war. This general could teach all the generals in Europe.' Saxe lived at his estate of Chambord for some time afterwards, and died there of dropsy, 30th November 1760. His work on the art of war, entitled *Mes Réveries*, was published at Paris in 1757.

Saxe was probably the greatest captain of his time, and a gallant and enterprising leader, but he was a mere soldier, and the offer of membership made to him by the Académie Française is sufficiently ridiculous. Saxe had, however, the good sense to decline the proffered honour, and he did so in a sentence, the extraordinary orthography of which accidentally rebuked, more than the most cutting sarcasm could have done, the mean sycophancy of the Académie. He wrote: 'Ils veulent me faire de la cadémie; cela m'irait comme une bague à un chapeau.'

Many biographies of Saxe have been written, but few of them are to be much depended upon.—See *Moritz von Sachsen* (Dresden, 1863), by Kr.

Weber; and the *Nouvelle Biographie Générale* (art. 'Saxe'). His character and genius are also well, though not flatteringly, portrayed in Carlyle's *Life of Frederick the Great*.

SAXE-ALTENBURG, the smallest of the minor Saxon states, is a duchy bounded by Saxe-Weimar, Prussian Saxony, the kingdom of Saxony, Saxe-Meiningen, and Schwarzburg-Rudolstadt, and separated into two nearly equal parts by the interposed principality of Reuss-Gera. The eastern portion, or circle of *Altenburg*, from its being watered by the Pleisse, was formerly called *Pleissengau*. It contains 254 English sq. m., with a pop. (1872) of 94,502. The western part, or circle of *Saale-Eisenberg*, is watered by the Saale, with the Orla and Rode, and contains 256 English sq. m., with a pop. (1872) of only 47,620. Total area, 510 sq. m., with a pop. of 142,122, nearly half of whom are inhabitants of towns. The vast bulk of the population (999 in 1000) are Protestants, there being in 1872 only 193 Catholics, 16 Christian sectaries, and 10 Jews. The eastern portion is open, undulating, and very fertile, and agriculture has here attained considerable perfection, and is diligently pursued by a large proportion of the population, so that much more corn is produced than is necessary for home-consumption. The peasants in this circle, though speaking the Thuringian dialect, exhibit in their dress, manners, and customs a family resemblance to the Wendish-speaking Serbs of Lusatia; and numerous names of places, especially those ending in *itz*, indicate their Slavic origin. They are celebrated throughout Germany for their skill as agriculturists, and their superior intelligence, knowledge, and comparative wealth. The revenue amounted in 1872—1874 to £127,274; and the expenditure, including the duke's civil list of £22,900, to the same sum. The troops are, of course, under the command of the emperor of Germany. S. is a limited monarchy, in accordance with the constitution of 29th April 1831, modified somewhat by the events of 1848—1849. By the law of 1870, the single chamber consists of 30 members, 9 representing the towns, 12 the country, and 9 the persons who pay most taxes. The government is in the hands of a ministry of three. As a member of the empire, S.-A. has one vote in the council, and one representative in the diet. Altenburg (q. v.) is the seat of government. See GERMANY, in SUPPLEMENT.

SAXE-COBURG-GO'THA (in German, *SACHSEN-COBURG-GOTHA*), the third in point of size and population of the minor Saxon states, is a duchy comprising the duchy of *Gotha*, lying between Prussia, Schwarzburg, Meiningen, and Weimar, and containing 542 English sq. m., with a pop. (1871) of 122,630; and the duchy of *Coburg*, 18 miles south of Gotha, lying between Meiningen and Bavaria, and containing 215 English sq. m., with a pop. (1871) of 51,709. Total area, 757 English sq. m.; pop. 174,339. Of the inhabitants, 172,786 are Protestants; 1263 Roman Catholics; and 210 are Jews. Gotha lies on the north side of the Thuringer-wald, which extends along and within its southern frontier; but the rest of this duchy consists of low, undulating, and very fertile land, and is watered by the Werra, an affluent of the Weser, the Unstrut, a tributary of the Saale, and several smaller streams. Coburg lies on the southern slope of the same range, is watered by the Itz and Rodach, affluents of the Main, and has extensive forests, and many beautiful valleys between the spurs of the Thuringer-wald. Of the surface of the whole duchy, $\frac{1}{3}$ ths is arable, $\frac{1}{3}$ ths is wood, $\frac{1}{3}$ th waste land, and the rest pasture and

gardens. In the plains and valleys, the climate is mild and salubrious, but in the mountainous parts of Gotha it assumes a more inclement character. Agriculture is the principal occupation of the people, and is pursued with energy and skill; corn and flax being produced in abundance, as also potatoes, and various leguminous plants. The breeding of horses, cattle, and sheep is also successfully conducted. The mineral wealth includes coal (chiefly in Gotha), iron, cobalt, manganese; also marble, porcelain-earth, mill-stones, and salt. The manufactures are not of much importance, and are chiefly confined to Gotha. There is a large beet-sugar factory at Gotha. The extensive forests of the duchy employ a large proportion of the population in the production of pitch, tar, and potash. The duchy is a limited monarchy, in accordance with the fundamental law of 3d May 1852. Coburg and Gotha have each a *landtag*, or diet; that of the former consisting of 11, and of the latter of 19 deputies; besides which there is a common *landtag* for the whole state, composed of 7 of the Coburg, and 14 of the Gotha representatives, who are elected by their several diets. The particular diets for the two duchies are elected by the people at large. There are two ministers for carrying on the government—one for Coburg, and another for Gotha. As a member of the empire, S.-C.-G. has one vote in the federal council, and has the right to choose two deputies to the imperial diet. As in other German states, the troops are under the command of the emperor of Germany. Education is well diffused, and the higher education is cultivated by the *gymnasias* and *academies*.

The finances of the two portions of the duchy are separately administered—that of Coburg being as follows: Receipts for the four years 1869—1873 averaging an annual income of £22,615, the expenditure being somewhat less; for Gotha—receipts, 250,000 florins, balancing the expenditure. The debt of Coburg amounted in 1871 to £129,400, including 300,000 florins of paper-money; of Gotha, £375,340, including 400,000 thalers in paper-money. The princely family is distinguished for the spirited and liberal character of its members, as well as for its physical and mental gifts. It is allied with several of the royal families of Europe, the present duke's younger brother having been the late Prince Albert of Great Britain, and his uncle, Leopold I., late king of the Belgians. The heir-apparent to the duchy is Alfred, Duke of Edinburgh, the second son of Queen Victoria of Great Britain. All the Saxon ruling families are descended from the Counts of Wettin, a place near Magdeburg. See GERMANY, in SUPPLEMENT.

SAXE-MEININGEN (also called *SACHSEN-MEININGEN-HILDBURGHAUSEN*), the second in size and population of the minor Saxon states, is a duchy, consisting of one large crescent-shaped territory, which lies immediately north of Bavaria and Coburg, with the horns of the crescent pointing northwards, and contains 862 English sq. m., and 11 small isolated territories, Kranichfeld and Kamm. The area of the whole is 955 sq. m., with a pop. (1871) of 187,884, including 1079 soldiers. Since other administrative changes and reforms were introduced, the territory, which till then had been divided into 11 administrative districts, was distributed into 4. Of the total population, 150,000 were, in 1871, Protestants; 1564 were Roman Catholics; 1625 were Jews; and 165 Christian sectaries of various kinds. The crescent is composed of the old duchy of Meiningen, the old city of Hildburghausen, and the principality of Saxe-Koburg (both of which, along with Kamm, were annexed to Meiningen in 1826). See GERMANY, in SUPPLEMENT.

SAXE-WEIMAR-EISENACH—SAXIFRAGE.

south-west of Thuringia (q. v.), and is traversed in the east and north by the Thüringer-wald, which shoots from which also cover the west, while the Rhön-gebirge enters the country at the south-west. Its surface is thus necessarily hilly, in some places even mountainous, Kiefern in the Thüringer-wald being 2700 feet, and Gehe-berg in the Rhön-gebirge, 2308 feet above sea-level; but between the mountain ridges are numerous fruitful valleys, and that of the Werra in particular is one of the most fertile and picturesque in Germany. The Werra, Saale, Milz, Steinach, Itz, &c., water the country. Two-fifths of the country is arable land; a nearly equal extent is under wood; and the rest is meadow, garden and vineyard, and pasture. In the lower lands, agriculture is in an advanced condition, and is prosecuted with such vigour, that corn enough is produced for home-consumption; potatoes, hemp, flax, and tobacco are the other chief crops.

The mining industry of the east and north is considerable, employing recently about 550 men; and the important mineral products are iron, copper, salt, coal, porcelain-clay, sulphur, and salt from the works of Salzungen, Neusulza, and Friedrichshall. S.-M. is also an active manufacturing district, chiefly in woollen, cotton, and linen fabrics, and paper; and brewing, distilling, the making of glass and porcelain, and various other branches of industry, are prosecuted. The fabrication of wooden toys in the district around Sonneburg employs 92 men, and the produce is bought up by the Sonneburg dealers for export. A rape-sugar factory is maintained. S.-M. is a limited monarchy in accordance with the fundamental law of 1829, and the laws of 1871 and 1873. The diet consists of 24 representatives—4 representing the more extensive townships, 4 the persons who pay most taxes, and being the deputies of the rest of the inhabitants. As a member of the empire, S.-M. has one vote in the federal council, and sends 2 deputies to the diet of the empire. The troops of S.-M. form part of the imperial army. The government is carried by four ministers, each of whom heads a separate department. The budget for 1872—1874 gives as receipts £108,090 (of which £48,120 come from the taxes); as expenditure, £96,250. On the 31st of December 1872, the public debt amounted to £3,453. The late duke, Bernhard-Erich-Freund, who reigned for 63 years, spontaneously gave his subjects a liberal representative constitution in 1824. S.-M. has for some time the distinction of being the best-governed state in Germany. See GERMANY, in SUPPLEMENT.

SAXE-WEIMAR-EISENACH, the largest of the minor Saxon states, is a grand duchy, consisting of Weimar, which lies between Prussia, Altenburg, and Schwarzburg-Rudolstadt, and contains inclusive of Allstädt, on the Unstrut, within an area of 45 English sq. m., and Ilmenau, in the east of Gotha, 32 English sq. m.) 683 English sq. m., with a pop. (1872) of 151,379; Eisenach, the northern portion, which lies to the north of Meiningen and Bavaria, and contains (inclusive of Ostheim, in the Rhön-gebirge, in Bavaria, 23 English sq. m.) 100 English sq. m., with a pop. (1872) of 84,298; and Weimars, which lies on the western boundary of the kingdom of Saxony, and contains 239 English sq. m., with a pop. (1872) of 50,506; total area, 785 English sq. m.; pop. 286,183, of whom 275,492 are Protestants, 9404 Roman Catholics, 53 Greek Catholics, 1120 Jews; the Jews and Catholics are chiefly in Eisenach. The Eisenach portion is traversed in the north by the Thüringer-wald, and to the south by the Rhön-gebirge, the intermediate districts being also hilly and undulating, and watered by the Werra and its feeders, the Fulda,

Ulster, Suhl, and Orsel. The Neustadt division is traversed from south-east to north-west by several offshoots of the Erz-gebirge, but most of the surface belongs to the plain of the Saale, and is watered by the Elster and Orla, affluents of that river. The Weimar portion is also partly hilly and uneven, and partly belongs to the plain of the Saale, which, with its tributary, the Ilm, traverses it. The highest peak in the grand duchy is Hinkelhahn (2694 feet), in the detached territory of Ilmenau. The climate is somewhat inclement in the high lands, more temperate in the plains, and particularly pleasant along the valley of the Saale. Of the whole surface, about 40 per cent is arable, 40 per cent is forest, and the rest is meadow-land, gardens, and vineyards. Agriculture is in an advanced condition, and is diligently prosecuted, there being frequently a surplus of grain over and above that required for home-consumption, in spite of the occasional infertility of the soil; and potatoes, pulse, hemp, flax, hops, and (on the banks of the Saale) vines are also cultivated. Horse and cattle breeding is a common pursuit in Neustadt and Eisenach, and sheep-breeding in Weimar, the sheep having the usual good reputation of the Saxon breed. The mineral wealth comprises coal, iron, copper, cobalt, and marble. Eisenach is the chief seat of the manufacturing industry, with the exception of the woollen manufactures, which are principally carried on in Neustadt. The form of government is, according to the revised fundamental law of 15th October 1850, a limited monarchy; the diet, or landtag, is composed of 31 deputies, 1 representing the landed nobility, 4 chosen by landed proprietors, with incomes under 1000 thalers, 5 by those who possess the same income from other sources, and 21 by universal suffrage. The government is administered by three heads of departments. As a member of the empire, S. has one voice in the federal council, and elects three deputies to the imperial diet. The troops of S. form part of one of the Thuringian regiments in the 11th corps d'armée of the empire. The budget for the financial period 1872—1874 shows annual receipts amounting to £283,971, and an annual expenditure of £275,811, leaving a considerable balance in favour of the exchequer. The public debt amounted in 1872 to a total of £531,589. The Grand Duke of Weimar is the chief of the Ernestine branch of the House of Saxony. The most celebrated of the Weimar family was Duke Karl-August, the Mæcenas of the art, literature, and science of Germany, who took the reins of government in 1775, and displayed extreme anxiety to favour the development of public prosperity and the progress of education. Under his fostering care, the university of Jena became a focus of intellect and knowledge to Germany; and the presence of Herder, Goethe, Schiller, and others at his court, well entitled it to be denominated the abode of the Muses. He also elevated the theatre of Weimar to its present position as the chief German school of dramatic art. In 1806, he joined the Confederation of the Rhine with the title of duke, and received from the Congress of Vienna an accession of territory, and the title of grand duke. In 1816, he granted a liberal representative constitution to his subjects, expressly guaranteeing the liberty of the press, and died 14th June 1828. His successors have followed in his footsteps. (See GERMANY, in SUPPLEMENT.)

SAXIFRAGE (*Saxifraga*), a genus of plants of the natural order Saxifragaceæ, or Saxifragaceæ. This order has a calyx, usually of five sepals more or less cohering at the base; a corolla usually of five perigynous petals, alternate with the sepals, rarely wanting; perigynous stamens; a hypogynous or

perigynous disc; an ovary, usually of two carpels, cohering more or less by their face, but diverging at the apex; fruit generally a 1—2-celled capsule, the

Saxifraga (*S. stellaris*).

cells opening at the ventral suture, and often divaricating when ripe; the seeds usually minute and numerous. The order *Saxifrageæ* is sometimes regarded as including above 900 species, divided into several suborders, which are elevated by some botanists into distinct orders—leaving, however, more than 300 species to the reduced order SAXIFRAGEÆ, which contains herbaceous plants, often growing in patches, with entire or divided alternate exstipulate leaves, natives chiefly of mountainous tracts in the northern hemisphere, and often found up to the limits of perpetual snow, some of them forming there a rich and beautiful turf, and adorning it with their very pleasing flowers. A considerable number are natives of Britain. Some of the genus *Saxifraga* are well known in gardens, and are employed to cover rock-works, &c. *S. umbrosa*, London Pride, or None-so-pretty, is familiar in all cottage gardens. It is a native of the hills of Spain, and of the south and west of Ireland.

SAXO-GRAMMATICUS (i. e., Saxo the 'Grammarians' or 'Scholar'), the most celebrated of the early Danish chroniclers, flourished in the 12th c., and was secretary to Archbishop Absalom. He is said to have died at Koeskilde in 1204. S. undoubtedly formed his style on that of the later Roman historians, particularly Valerius Maximus, yet in his whole mode of representation, he belongs to the school of medieval chroniclers, although ranking first in that school. Erasmus half wondered at his elegance. Moreover, it adds mightily to our respect for S., that although a cleric, he did not in the very least degree allow himself to be swayed in his historical conceptions by the prejudices incident to his profession. His work is entitled *Historia Danica*, and consists of 16 books. The earlier portions are of course not very critical, but in regard to times near his own, S. is a most invaluable authority. According to his own statement, he derived his knowledge of the remoter period of Danish history—the 'Heroic Age' of the North—from old songs, Runic inscriptions, and the historical notices and traditions of the Icelanders; but he is not sharply critical in his treatment of the Danish sagas, although a rudimentary critical tendency is occasionally visible. The best edition of the *Historia Danica* is that undertaken by

P. E. Müller, and finished by J. M. Velschow (Copen. 1839). It is furnished with a complete critical apparatus. There are good translations from the original Latin into Danish.

SAXON ARCHITECTURE, the style of building used in England before the introduction of the Norman architecture at the Conquest. There are few specimens remaining which can be depended upon as genuine. The Saxons built chiefly in wood, and all their wooden edifices are now lost. It seems probable that a rude and simple style, not unlike Early Norman, was that used by the Saxons. There

Tower of Earl's Barton, Northamptonshire.
(From Parker's *Glossary of Architecture*.)

are several buildings in England which Mr. Rieu considers entitled to rank as Saxon. Amongst these the Tower of Earl's Barton, Northamptonshire, is one of the best examples. The peculiar 'lozenge-shaped' work of the quoins, the projecting buttresses running up the face of the walls, and the interlaced like wood-work, and the baluster-like shafts between the openings of the upper windows, are all characteristic of the style.

SAXON LAND. See TRANSYLVANIA.

SAXON STATES, MINOR. The capitulation of Wittenberg, which followed the rout of Mühlberg (see SAXONY), and deprived John Frederick the Magnanimous of the electorate of Saxony, the same time despoiled him of a large part of the hereditary possessions of the Ernestine line. The remainder, amounting—after the acquisition of Coburg, Altenburg, Eisenberg, &c., in 1552—to little more than one-fifth of the whole Saxon territory, was divided into two portions, *Saxe-Coburg* and *Saxe-Weimar*, the former falling to Frederick II., and the latter to John William, the sons of the deposed elector. Each of these portions was afterwards subdivided, the former into *Saxe-Coburg* and *Saxe-Eisenach*, and the latter into *Saxe-Weimar* and *Saxe-Altenburg*. It would bewilder the reader to attempt to follow the subdivisions and reunions that followed. See SAXONY.

SAXON SWITZERLAND—SAXONY.

to say, that the gradual adoption of the law of primogeniture during the 18th c., and the extinction of various cadet branches, has left the four states of Saxe-Altenburg, Saxe-Coburg-Gotha, Saxe-Meiningen, and Saxe-Weimar-Eisenach, as described under their several names. Should the Albertine or Saxon-royal line become extinct, the Duke of Weimar succeeds to the throne; and failing his family, the lines of Saxe-Meiningen, Saxe-Altenburg, and Saxe-Coburg-Gotha obtain in this order the right of succession.

SAXON SWITZERLAND. See SAXONY.

SAXONS (Lat. *Saxones*, Ger. *Sachsen*), a German people, whose name is usually derived from an old German word *saxa*, meaning a 'knife,' are first mentioned by Ptolemy, who makes them inhabit a district south of the Cimbric Peninsula. Towards the end of the 3d c., a 'Saxon League' or 'Confederation' makes its appearance in North-western Germany, to which belonged, besides S. proper, the Cherusci, the Angrivarii, and the largest part of the Chauci. In the times of the emperors Julian and Valentinian, S. and Franks invaded the Roman territory; but their piratical descents on the coasts of Britain and Gaul are far more famous. At what period these commenced, it is impossible to tell, but it is believed to have been much earlier than is commonly supposed. Recent investigations seem to prove that S. had established themselves in England long before the time of the mythical king of the Horsa (see **ANGLO-SAXONS**); and we know that as early as 287 A.D., Carausius, a British admiral in the Roman service, made himself 'Augustus' in Britain by their help. They had firmly rooted themselves, at the beginning of the 5th c., in the present Normandy, where a tract of land was named after them, the *Limes Saxonicus*. They fought against Attila (q. v.) in the Catalaunian plain, 451 A.D. They also obtained a footing at the mouth of the Loire; but all the S. who settled in France 'disappeared' before the Franks, i. e., were probably incorporated with their more powerful names of Southern Germany. At home, the S. called *Alt Sachsen*, or 'Old Saxons,' to distinguish them from the emigrant hordes who found their way to England and France) enlarged, by conquest, their territory north and north-west as far as the North Sea, the Yssel, and the Rhine; south, as far as the Sieg, and nearly to the Eder; eastward, to the Weser and Werra, the Southern Harz, the Elbe, and the Lower Saale. Along with the Franks, they destroyed the kingdom of the Thuringians in 531, and obtained possession of the land between the Harz and the Unstrut; but this district was in 590 forced to acknowledge the Frankish sovereignty. From 719, wars between the S. and the Franks came constant; but the latter, after 772, were generally successful, in spite of the vigorous resistance offered by Wittekind; and in 804, the S. were finally subjugated by the arms of Charlemagne. Wittekind was the last Saxon king, and the first non-duke of the German empire. A collection of the old national laws and usages of the S., under the title of *Lex Saxonum*, was made during the reign of Charlemagne.

During 1830—1840, A. Schmeller published (from 10 manuscripts, one preserved at Munich, and the rest in the British Museum) an 'Old Saxon' poem of the 9th c., called *Heliand*, i. e., the 'Healer,' or 'saviour,' which narrates in alliterative verse the history of Christ 'according to the Gospels, whence it is also called the 'Old Saxon Gospel Harmony.' It is probably a part of a more comprehensive work, embracing a poetical treatment of the history of the Old and New Testament, which Ludvig the

Pious intrusted to some celebrated Saxon singer. This unknown poet lived, as his language leads us to conjecture, somewhere between Münster, Essen, and Kleve. His work is not only the almost sole monument of the old Saxon tongue left us, but is also of high poetical value, through its warmth of feeling, and the strength and splendour of its diction—worthy, indeed, to take its place alongside the contemporary Anglo-Saxon and old Norse poetry.—See Vilmar's *Deutsche Alterthümer im Heliand* (Marb. 1845).

SAXONY (Ger. *Sachsen*), KINGDOM OF, the second in importance and population of the minor German states, though inferior to three of them in extent, is bounded on the N. and N.-E. by Prussia, S.-E. and S. by Austria, and W. by Bavaria, Thuringia (q. v.), and Prussia. It is divided, for administrative purposes, into the following circles:

	English Sq. Miles.	Pop. in 1871.
Dresden,	1680	677,671
Leipzig,	1370	589,377
Zwickau,	1790	259,063
Bautzen,	950	230,133
Total,	5790	2,556,244

The kingdom is somewhat of the form of a right-angled triangle, with the right angle in the north-west, and the longer side lying along the foot of the Erzgebirge range, which sends its spurs northward over the southern half of the country, giving to that portion a somewhat mountainous character, while the northern half remains a flat or undulating plain. The whole country, with the exception of a small portion in the extreme east, which belongs to the Oder basin, and is watered by the Neisse, is drained by the Elbe (which is wholly navigable in S.) and its tributaries the Mulde, Wilde-Weisseritz, Trubsch, Mulde, and White Elster, on the west; and the Wessnitz, Black Elster, and Spree on the east. From the point where the Elbe bursts through the Erzgebirge chain to within about 8 miles of Dresden, it traverses a district rich in picturesque scenery, to which the somewhat inappropriate name of *Saxon Switzerland* has been given. This district, which averages about 24 miles long by 23 broad, is an elevated plateau of coarse crumbling sandstone (much resembling the English green-sand); and though destitute of the perpetually snow-clad mountains, glaciers, serrated ridges, and escarped peaks which give a character of lofty grandeur to its namesake, it can boast of features equally peculiar and strikingly romantic. From the soft nature of the rock, it has yielded freely to the action of the mountain rills, which rise from the hills on its east and west borders, and converge to the Elbe, and is cut up in all directions by deep narrow gorges (so symmetrical in their formation as to resemble artificial lanes), the constantly deepening beds of these mountain torrents, which here form cascades, there sullenly glide through deep vales bordered by rocks of the most fantastic forms, or by steep rugged slopes thickly clad with trees. High above the level of the plateau rise towering rocks, some of them pyramidal or conical, others pillar-like, while a few taper almost to a point, and then bulge out at the top; all clearly testifying to the agency by which they have been produced. The medieval knights took advantage of these curious results of nature's so-called freaks, to erect castles upon the summits of some of them; several of these castles still exist, and one of them, Königstein, is almost the only virgin fortress in Europe. The most remarkable of these peaks are Königstein (864 feet), Lilienstein (1254 feet), the Bastei (600 feet), Nonnenstein, Jungfernsprung, and seven others, each of which possesses its group of traditionary gnomes and

SAXONY.

kobolds. The lakes of S. are unimportant, and the only canals are those constructed between the mines and ore-mills.

Climate, Soil, Products, &c.—The climate is healthy, and on the whole temperate, though occasionally severe in the south-western districts. Of the whole surface, more than one-half is arable, nearly one-third is in forest, about one-ninth in meadow, while the rest is occupied by gardens and vineyards, coarse pasture and waste land, or quarries and mines. The arable land has long been in a high state of cultivation, as is the case with the whole of Upper S. (see *History*), yet notwithstanding this, and its extreme fertility, the produce is hardly sufficient to supply the wants of the dense population (441 to the English sq. mile). The agricultural products consist of the usual cereals and leguminous plants, with rape, buck-wheat, hops, flax, and potatoes, and all kinds of fruits suited to the climate. The forests, the largest of which are in the Voigt-land (the south-west corner of Zwickau), and along the northern slopes of the Erz-gebirge, supply timber of excellent quality, and in such abundance as to render them one of the great sources of wealth and industry. The rearing of cattle is an important employment in the mountainous districts of the south-west. Sheep, for which S. was formerly so famous, have been less generally attended to of late years, though, from the introduction of merinos, and increased care in breeding and rearing, the quality of the wool has much improved, and at the present day it occupies a high position in the markets of the world. Minerals are another great source of national wealth, the ore being both rich and abundant, and the processes of excavation and smelting in a high state of perfection. Most of the mines belong to the crown; they are situated in Zwickau and Dresden, and mostly on or near the northern slope of the Erz-gebirge. The mineral wealth includes silver, tin, iron, cobalt, bismuth, zinc, lead, nickel, arsenic, antimony, and other metals, besides coal, marble, porcelain-earth, vitriol, and various gems. In 1870, there were in operation 75 coal-mines, employing 13,410 men, and raising coals to the value of upwards of 7 million thalers; and 275 other mines, 9962 men, and raising metal to the annual value of upwards of 2 million thalers.

Manufactures, Commerce, &c.—Manufacturing industry has also been greatly developed, and several branches have been carried to a high degree of perfection. This species of labour employs nearly three-fifths of the whole population. The oldest manufacture is that of linen, which at present employs more than 16,000 looms; but it is now eclipsed by the cotton-spinning and weaving, which is the most important branch of Saxon industry, has its chief seats at Chemnitz, Frankenberg, Zschoppau, Folkland, and Lausitz, and gives work to upwards of 160 spinning-mills. The woollen manufactures are also extensive. Broadcloth, thread, merinos, silks, mixed silk and woollen wares, &c., are also produced in considerable quantity, and of excellent quality; the muslin de laines being still preferred by many to those of England and France, while the laces and embroideries preserve their ancient well-won reputation. Saxon pottery and porcelain have long been famous. The chief centres of manufacturing industry are in Bautzen and in the mountainous country to the north of the Erz-gebirge. Owing to this extension of manufacturing industry, combined with a deficiency in the supply of home-grown articles of consumption, an extensive foreign commerce is rendered necessary, and this is chiefly carried on through the medium of the great fairs of Leipzig (q. v.). The chief imports are corn, wine, salt (not found in S., though common enough in

Prussia Saxony), cotton, silk, flax, hemp, wool, coffee, tea, &c. The country is well provided with roads, railways, and lines of telegraph.

Government, Religion, Education, Revenue, &c.—The government of this very interesting country—the reading of the history of which leaves on the mind a firm sense of both past ages and present activity—is a limited monarchy, hereditary in the Albertine line, and is carried on according to the constitution of September 4, 1831, modified by several changes in 1849, 1851, 1860, 1861, and 1867. By the electoral law passed in the latter year, the first of the two chambers which constitute the legislature consists of the princes of the royal family, certain nobles, representatives of the Lutheran and Roman Catholic churches, the chief professors, representatives of the universities, and the burgo-masters of the eight principal towns. The second chamber comprises 36 deputies from the towns, and 45 from the rural communes. The supreme administration is managed by six ministers of Justice, Finance, the Interior, War, Religion and Education, and Foreign Affairs. The established religion is the Lutheran, though the reigning family, from the time of Fr. Augustus I., have been Roman Catholic. The church department must, so long as the reigning family remains Roman Catholic, be administered by a member of the Established Church. In 1871, there were 2,484,075 Lutherans; 9347 Reformed; 53,642 Roman Catholics; 17 Greek Catholics; 452 Anglicans; 3015 Greek Catholics; 3358 Jews; 1041 of other religions, and 760 unknown. Education is carefully promoted. In 1867, there were upwards of 200 elementary schools, 11 gymnasia; the universities at Leipzig. The budget for 1872—1873 showed receipts to the amount of 13,752,919 thalers, and expenditure, 13,646,615. The public debt at the end of 1872 amounted to 115,003,250 thalers, of which 75 millions were incurred for railways. Saxon troops form the twelfth corps d'armée of the German empire. S. has a war ministry of its own, but after the war of 1866, S. paid the penalty for her opposition to Prussia by being compelled to make over to the king of Prussia the supreme military command of the Saxon army, the garrison of the fortress of Königstein, the management of the postal, railway, and telegraphic systems, and the charge of the diplomatic representation abroad. As a member of the German empire, S. has four voices in the federal council, and has the right to send 23 deputies to the diet.

History of the Great Duchy of Lower Saxony.—*of the Ascanian Electorate of Upper Saxony.*—After the final conquest of the Saxons by Charlemagne, they became one of the components of the German empire; but their country by no means corresponded to what is now known as Saxony. It included the most of the country between the Elbe, the Elbe Mountains, the Rhine, and Friesland; and, in 919, was erected into a dukedom, with Lubeck for capital, and ruled by hereditary princes. But the first duke, is said to have been the great-grandson of Wittekind, but nothing is certainly known of his ancestry. His second son, Otto the first (880—912), was the most distinguished of German princes; he fought valiantly against the Normans, and, on the extinction of the Carolingian dynasty (911), refused the crown of Germany which was unanimously offered him by the electors. His son Duke Henry (912—936), surnamed 'the Fowler,' obtained the throne (919), and commenced the Saxon line of German sovereigns, which was continued by Otto I. (q. v.), Otto II. (q. v.), Otto III. (q. v.), and Henry II., and ended in 1024. Otto I. handed over the great duchy of S. to Hermann

SAXONY.

llung in 900, on condition of military service; and this family held it till 1106. Under the Billung dynasty, the prosperity of the country greatly increased, and Meissen, Thuringia, East S., in Lusatia, S. in the Northern Mark, Anhalt, Salztedel, and Slesvig, were all dependent on the Saxon king. A portion of S. had, however, been reserved to the emperor, Otho I., for his nephew Bruno, who held a lordship of Saxony-Brunswick; and, in the middle of the 11th c., a duchy of 'Saxony on the Weser' was also founded; but both of these united by marriage in 1090 or 1096) came (1113) by marriage to Count Lothar of Supplinburg, who was invested (1106) with the great duchy of S., which was now more extensive than ever, stretching from the Unstrut, in Gotha, to the Eider, and from the Rhine to Pomerania. After Lothar's accession to the imperial throne in 1125, he handed over (1127) the duchy to his son-in-law, Henry the Proud, Guelphic Duke of Bavaria, who was thus the ruler of more than half of Germany; but this overlordship did not long exist, for under his son, Henry the Lion (q. v.), it was wrested (1180) from the House of Guelph, Bavaria being given to the House of Wittelsbach; East Saxony created an electorate, and given to Bernhard of Ascania; Brunswick and Lüneburg mostly restored to Henry's sons; while the numerous and powerful bishops of Northern Germany divided among themselves Westphalia, Oldenburg, and many portions of Lüneburg-Brunswick; Mecklenburg and Holstein became dependent, and the Saxon palatinate in Thuringia it to the Landgraf Ludwig. S., now shorn of former greatness, consisted chiefly of what is Prussian S., a few districts separated from Oldenburg, and Saxe-Lauenburg, the last being only a portion of the great duchy of S., or *Lower Saxony*, as it is called, which retained the name. Lüneburg was the capital of the new duchy. S. diminished in 1211 by the separation of Anhalt as a separate principality; and in 1260, it was permanently divided into two portions, *Saxe-Weimar* and *Saxe-Wittenberg*, to the latter of which the electoral dignity remained, and to which, in subsequent dispute between the two branches, was confirmed by the celebrated Golden Bull (1356). The Ascanian line became extinct in 1422 with Duke Albert III., and the duchy then passed to Frederick the Warlike, Markgraf of Misnia, and margrave of Thuringia, who was invested with it by the Emperor Sigismund in 1423. His possessions consisted of Thuringia, the present kingdom of S., Prussian S., in fact, the whole of *Upper Saxony*, with the exception of Anhalt.

History of the Country now known as Saxony.—The earliest inhabitants of Upper S., since the Christian era, were the Hermunduri (see THURINGIA); and on the destruction of the great Thuringian kingdom in the beginning of the 6th c., their remnants were taken possession of by the Sorbs, a Slavic race, who practised agriculture and cattle-rearing. The Carolingian rulers, dissatisfied with the progress of those non-German tribes, erected 'marches' to bar their progress; and Duke Otho the Illustrious of S., and his celebrated son, Henry the Fowler, warred against them, the latter—subduing the Heveller, the Daleminzer, and the Miltzer—introduced into their country the marks of Brandenburg (q. v.), Misnia (Meissen), and Lusatia (Lansitz), and planted colonies of Germans among the Sorbs. In 1200, the mark was bestowed on the House of Wettin (a supposed off-shoot of the race of Wittebold), and was confirmed as a hereditary possession to that family in 1127; and the markgraf, Henry the Illustrious (1221–1288), whose mother was a princess to the landgraviate of Thuringia, with its

appendages, combined the whole into a powerful state. Business, commerce, and mining industry now flourished; great roads for commercial purposes were constructed throughout the country, and the Leipzig fairs were established; and, in spite of much internal discord, and frequent partitions of S., its prosperity increased. At last, **FREDERICK THE WARLIKE** (1381–1428) succeeded in uniting the severed portions of S., to which were added, by purchase and marriage, various districts in Franconia; and in 1423, the electorate of S. (see above). The Saxon elector was now one of the most powerful princes of Germany; but unfortunately the fatal practice of subdividing the father's territories among his sons still continued, and during the reign of the Elector **FREDERICK THE MILD** (1428–1464), whose brother William had obtained Thuringia, a civil war broke out, and was carried on for years. **ERNEST** (1464–1486) and **ALBERT** (1464–1500), the sons of Frederick, in accordance with the will of their father, reigned conjointly over the hereditary domains of the family (the duchy of S., with the electoral dignity, being reserved always to the eldest) till the death of their uncle (1486), when Ernest obtained Thuringia, and Albert, Meissen, while Osterland was equally divided between them. Ernest, the founder of the *Ernestine*, which was also the *elder or electoral line*, was succeeded by his son, **FREDERICK THE WISE** (1486–1525), who favoured the reformation, and firmly supported and protected Luther against the overwhelming power of the Catholic party, which he was enabled to do, from his personal influence with the Emperors Maximilian and Charles V. His brother and successor, **JOHN THE CONSTANT** (1525–1532), was still more a partisan of the new doctrines, as was also his son and successor, **JOHN FREDERICK THE MAGNANIMOUS** (1532–1547); but the latter, by the defeat of Muhlberg (q. v.) (see **SCHMALKALD**), was forced to resign both his electoral dignity and his states. Albert, the founder of the *younger, ducal, or Albertine line*, was succeeded by his sons, **GEORGE THE BEARDED** (q. v.) (1500–1539), a rabid Catholic, and **HENRY THE PIOUS** (1539–1541), a no less zealous Protestant; after whom came the celebrated **MAURICE** (1541–1547), who was a professed Protestant, but joined the Catholic party against the league of Schmalkald, obliged the Protestant army to retreat from the Danube, and took possession of the estates of the Elector John Frederick, who, however, speedily drove him out, and took possession of ducal S. in his turn. After the rout of the Protestants at Muhlberg, Maurice received the electoral title (1547–1553), and the greater portion of the estates of his vanquished cousin. But the arbitrary political measures and religious severities which were either instituted or promoted by the emperor, induced Maurice to join the Protestants, and by a sudden march on Innspruck, he forced the emperor to agree to the peace of Passau. New tyrannical measures of the emperor caused him to look to an alliance with France, but the scheme was frustrated by his death, July 11, 1553, near Sievershausen, where two days before he had totally defeated the Markgraf Albert of Kulmbach, a secret agent of the emperor's. His brother, **AUGUST I.** (q. v.) (1553–1586), the first economist of the age, has left a memory dear to S., from the numerous excellent institutions which he established; he considerably increased his territories by purchase and otherwise, and restored Altenburg to the Ernestine line. **CHRISTIAN I.** (1586–1591), a weak prince, surrendered the reins of government to his chancellor, Crell, who was sacrificed, in the succeeding reign of **CHRISTIAN II.** (1591–1611), to the revenge of the offended nobility. **Christian II.** weakly

neglected to assert his claims to Juliers, on the death of its last duke, and allowed it to become a prey to Brandenburg and the palatine House of Neuburg; but his brother, JOHN GEORGE I. (1611—1656), in revenge for this spoliation, allied himself to Austria, and conquered Upper and Lower Lusatia and Silesia. Subsequently, the good understanding between these powers was destroyed, and the elector allied himself with Gustavus Adolphus (1631), and took part in the Thirty Years' War. But on the death of Gustavus, the elector separated from the Swedes, and made a separate peace (1635) with Austria, by which he obtained Upper and Lower Lusatia, acquisitions confirmed by the general treaty of Westphalia (1648). This was the period of the electorate's greatest power. His sons, JOHN GEORGE II. (1656—1680), August, Christian, and Maurice, divided the estates, the three latter founding cadet lines, all of which became extinct before 1750. The reigns of his successors, JOHN GEORGE III. (1680—1691) and JOHN GEORGE IV. (1691—1694), are unimportant, but that of **FREDERICK AUGUST I.** (q. v.) (1694—1733) well-nigh ruined the hitherto prosperous electorate. Frederick August had been chosen king of Poland; and his attempt, in company with the czar and the king of Denmark, to dismember Sweden, brought down upon him and his two states the vengeance of the northern 'fire-king.' Poland was utterly devastated, and S. exhausted of money and troops. Besides, the king's habits were most extravagant, and to maintain his lavish magnificence, he was forced to sell many important portions of territory. **FREDERICK AUGUSTUS II.** (q. v.) (1733—1763), also king of Poland, took part in the war of the Austrian Succession (q. v.) against Maria Theresa, but finding the treaty of Berlin (1742) not so satisfactory for himself as he expected, he joined the empress in 1745. The country was atrociously ravaged during the Seven Years' War (q. v.), and a long time elapsed before it recovered its previous peaceful and prosperous state. **FREDERICK CHRISTIAN** (1763—1763) and **FREDERICK AUGUST I.** (1763—1827), laboured zealously for the good of their subjects; and under the reign of the latter, agricultural, manufacturing, and industrial enterprise progressed with rapid strides. In spite of his love for peace, the elector was led into the quarrel respecting the Bavarian Succession (q. v.); but he refused the crown of Poland in 1791, and declined to take part in the convention of Pilnitz, though he joined the Prussian confederation of German princes, and had an army of 22,000 Saxons at the battle of Jena. But the pressure of the French compelled him to join the Confederation of the Rhine in 1806, and from this time his army fought side by side with the French. He obtained the union to S. of the duchy of Warsaw (see **POLAND**); but fearing that the disasters of the French, in 1812, would be fatal to their supremacy, and to the interests of S., he withdrew to Bavaria, and thence to Prague, renounced the duchy of Warsaw, and made every attempt to come to amicable terms with the allies. But he was again compelled to join the French, between the battle of Lutzen (May 2, 1813) and that of Leipzig (October 16—19, 1813), after which he became the prisoner of the allies, and his army was joined to theirs. For his support of Napoleon, he was deprived of the greater portion of S., which was handed over to Prussia, but he retained the title of king, which had been conferred upon him in 1806. The rest of his reign was occupied with internal reforms. **ANTONY** (1827—1836) reformed the entire legislation of the country, and granted a liberal constitution, being urged thereto by a popular outbreak in the autumn of 1831. The constitution was proclaimed September 4, 1831, and the state's

representatives first assembled, January 27, 1832. **FREDERICK AUGUST II.** (1836—1854), his nephew who had been regent for several years, now succeeded, and though favourable to constitutionalism, he was unable to obtain the smooth and harmonious working of the new system. In 1843, violent contests commenced, accompanied by occasional riots in the principal towns, on the subject of the liberty of the press, and the publicity of legal proceedings. Sometimes the constitutionalists, and sometimes their opponents, gained the supremacy, and for a long time, the efforts of the two parties counteracted each other. Towards the close of the king's reign, he was a mere tool in the hands of the reactionary party, headed by his brother JOHN, who succeeded in 1854. John, however, supported constitutionalism, and established courts of justice throughout the kingdom. For the hostile attitude assumed by S. towards Prussia before 1866, and the consequences to S., see **GERMANY**, and **GERMANY IN SCPT.**

SAXONY, PRUSSIAN, the most westerly detached province of Prussia, bounded on the W. and N.-E. by the provinces of Brandenburg. Area 9738 sq. m.; pop. (1871) 2,103,655. The western districts are occupied by the Harz Mountains, and the peak of the Brocken (3738 feet high) is the highest elevation. The greater portion of the surface, however, is level, and slopes toward the north, in which direction flow the principal rivers—the Elbe, with its tributaries, the Saale and Mulde. The climate is mild and healthy, and the soil is exceedingly fertile and well cultivated. More than the half of the area is under crop, and nearly 4ths are uncultivated, and in water and wood. The *Goldene Aue*, in the south-west, is especially famous for its abundant fertility. Manufacturing industry is most actively carried on, and there are spinning, weaving, and oil-mills in great numbers. The capital is **MAGDEBURG** (q. v.). The larger portion of Prussia (7911 sq. m.) was detached from the kingdom of Saxony, and ceded to Prussia, by decree of a Congress of Vienna, 1815. See **SAXONY**.

SAY, JEAN BAPTISTE, an eminent French economist, was born at Lyon, 5th JANUARY 1767. Being destined by his father for a commercial career, he passed a part of his youth in England, and on his return to France, obtained a situation in a Life Insurance Company, about which time he made his first acquaintance with the works of Adam Smith. During the Revolution, he was some time secretary to Clavière, the Minister of Finance; and from 1794 to 1800 edited a paper called *La Décade*, in which he expounded with effect the views of Smith. Already S. had acquired a distinguished reputation as a thinker by his *Essai d'Economie Politique, ou Simple Exposé de la Manière dont se forment, se distribuent et se consomment les Richesses* (Paris, 1803), and other works. Called to the tribunate in November 1799, he was not slow to express his disapprobation of the arbitrary policies of the new consular government, and in 1804 ceased to be a member of a body that had become a mere tool in the hands of Bonaparte. Under the despotism of the Empire, S. was forced into private life, and betook himself to industrial pursuits, establishing (along with his son) at Auch a cotton-spinning-mill, which soon employed not less than 600 workmen; and when Bonaparte fell, S. placed himself at the head of the economical and commercial movement that marked the epoch. In 1814, the second edition of his now celebrated *Traité d'Economie* was dedicated to the Emperor Alexander, who had called himself his 'pupil,' and in the same year the French government sent him to England to examine the economical condition of that country. In 18

a new chair, that of *Economie Industrielle*, was rated for him at the *Conservatoire des Arts et Metiers*; and S. added both to his influence and his popularity by the lucidity, grace, and intensity of conviction displayed in his lectures. In 1831, he was appointed Professor of Political Economy at the *Collège de France*, but died 15th November 1832. Although strictly a follower of Adam Smith, S. is an independent, sagacious, and penetrative thinker. Ricardo speaks of his works as containing 'several curious, original, and profound discussions.' He was the first to teach Frenchmen to consider rationally such questions as customs-duties, the currency, public credit, the colonies, and taxation; although the brilliant socialistic theorists say that he is not an *économiste spiritueliste*, many will ascribe that defect to a merit. Besides his *chefs-d'œuvre* already mentioned, S. wrote (among other works) *De l'Angleterre et des Anglais* (Par. 1812), *Économie d'Economie Politique* (Par. 1815), *Notes à Malthus* (Par. 1820), *Cours Complet d'Economie Politique* (Par. 1828-1830), and *Échanges et Correspondance* (Par. 1833). His principal writings form vols. 9-12 in Guillaumin's *Œuvres des Économistes*.

SCAB, in Sheep, like itch in man, or mange in dogs, depends upon the irritation of a minute acarus, which burrows in the skin, especially dirty and scurfy, causing much itching, roughness, and baldness. The parasite readily adheres to clothes, trees, or other objects against which the itched sheep happen to rub themselves, and hence ought to be transferred to the skins of sound sheep. One amongst the approved remedies are diluted mercurial ointments, tobacco-water, turpentine and arsenical solutions, such as are used for ear-dipping. One of the best and simplest applications consists of a pound each of common salt and red tobacco, boiled for half an hour, in about a gallon of water; to this are added two drachms of nitric sublimate; and the mixture diluted until it measures three gallons. For each sheep, a pint of this mixture should be carefully applied, from a narrow-necked bottle, along the back, and to any other scurfy itchy parts. A second dressing, after an interval of a week, will generally effect a perfect cure.

SCABBARD is the sheath for a sword or rapier, at once to render the weapon harmless and to protect it from damp. It is usually made of black leather, tipped, mouthed, and ringed with steel; but the British cavalry wear scabbards of steel. These better sustain the friction against the horse's accoutrements, but are objectionable from their noisiness, and the consequent impossibility of surprising an enemy. The sword-scabbard is suspended to the belt by two rings; the bayonet-scabbard hooks into a frog in connection with the waist-belt.

SCABELLUM, a kind of pedestal to support statues.

SCABIES. See ITCH.

SCABIOUS (*Scabiosa*), an extensive genus of fraxaceous plants, exclusively natives of the eastern hemisphere, of the natural order *Dipsacaceæ*. See EASEL. The flowers are collected in terminal whorls, surrounded by a many-leaved involucre, so as to resemble those of the order *Compositæ*. The ERYTHRO-BIT S. (*S. sucicina*) is a very common staminal flower in British pastures. The plant possesses great astringency, but no important medicinal virtues, although it was formerly supposed to be of great efficacy in all scaly eruptions, and hence the name S., from *Lat. scabies*, leprosy. The end of the root appears as if abruptly bitten off, and

the superstition of the middle ages regarded it as bitten off by the devil, out of envy, because of its usefulness to mankind! The SWEET S. (*S. atropurpurea*) is a well-known fragrant garden-flower. It is supposed to be a native of India.

SCAD (*Caranx trachurus*, or *Trachurus vulgaris*), a fish of the family *Scomberidae*, sometimes called the *Horse Mackerel*, because of its resemblance to the mackerel, and its comparative coarseness. It is from 12 to 16 inches long, of a dusky olive colour, changing to a resplendent green, waved with a bluish gloss, the head and lower parts silvery, the throat black. There are two small free spines in front of the anal fin. The species of *Caranx* are very numerous, and it is sometimes divided into several genera;

Scad (*Caranx trachurus*).

but the S. is the only one found on the British coasts. It is common on the south-western coasts of England, but comparatively rare to the north. It sometimes appears in immense shoals, pursuing the fry of herring or similar prey, and the multitudes have sometimes been so great and so crowded together, that they could be lifted out of the sea by buckets, and overloaded nets have been torn to pieces. The S. has something of the mackerel flavour. Although not much cared for when fresh, it is often salted, and in that state is esteemed as an article of food.

SCA'FELL, a double-peaked mountain in Cumberland, on the Westmoreland border, 13 miles south-south-west of Keswick, is a chief feature in the scenery of the Lake Country, in the heart and centre of which it stands. Of its two peaks, the higher is 3229 feet, the other 3092 feet in height.

SCAGLIOLA, a composition made to imitate the more costly kinds of marble, and other ornamental stones; and so successfully is it done, that it is often difficult to distinguish between the artificial and the real stone. It consists of finely ground plaster of Paris mixed with a thin solution of fine glue, and coloured with any of the earthy colours, such as ochres, umber, Sienna earth, Armenian bole, and sometimes chemical colours, such as the chrome yellows, &c. This is spread over the surface intended to represent marble; and whilst still soft, pieces of fibrous gypsum, marble, alabaster, and other soft but ornamental stones, are pressed into it, and made level with the surface. When the composition is set hard, it is rubbed down, and polished with the ordinary stone-polishing materials, which give it a very fine gloss. This kind of work is only adapted for interiors, because scagliola will not bear exposure to damp for any length of time; but its lightness, and the extreme ease with which it may be applied to walls, pillars, pilasters, and even cornices, render it very useful for the decoration of the better class of dwellings and public buildings.

SCALA NOVA, a seaport of Asiatic Turkey, stands on an eminence at the head of a gulf of the same name, 40 miles south of Smyrna. The ruins of the ancient city of Ephesus (q. v.) are in the vicinity. An important export trade is carried on. Pop. stated at 20,000. The Gulf of S. N., confined on the south by the island of Samos, is 40 miles long, and about 20 miles broad.

SCALD-HEAD (a corruption probably of *Scaled Head*) is the popular name of a fungous parasitic disease of the scalp (and occasionally of the

face and other parts), known in medical phraseology as *Favus*, *Tinea favosa*, and *Porrigo scutulata*. The primary seat of the parasite is in the lowest portion of the hair-follicles, outside the layer of epithelium which covers the root of the hair. The plant is, however, often found in cup-shaped depressions on the surface of the scalp, forming the yellow honeycomb-like masses which suggested the specific name *Favus* (honeycomb) for the disease. The honeycomb crust continues to increase, preserving its circular form and depressed centre, till it occasionally reaches a diameter of nearly half an inch. These crusts commonly appear in crops, and may be either distinct or confluent. 'At a more advanced stage,' says Dr Aitken, 'the epidermis disappears, and a viscid fluid is secreted in such abundance as to form one entire incrustation over the entire head; hence the *Porrigo larvalis*—mask or vizor-like scald-head. The

smell of the scab is peculiar, and has been compared to that of the urine of a cat, or of a cage in which mice have been kept. It is probably due to a species of alcoholic fermentation in connection with the vegetable growth.' The scab sometimes resembles a lupine, or a minute shield, rather than the cell of the honeycomb, and hence the varieties of scald-head which have been described under the name of *Porrigo lupinosa* and *Porrigo scutulata*.

The great point to be aimed at in the treatment of this affection is to destroy the cryptogamic parasite, and to eradicate its germ. For this purpose, the head should be shaved, and poultices then applied till the scabs are removed. Tar-ointment should then be applied, night and morning, the old ointment being washed off with soft soap and water before the fresh dose is laid on. Dr Aitken states, that in the early stage of the disease, in place of the preceding treatment, it is sometimes sufficient to cut the hair close, and to wash the affected parts, night and morning, with oil of turpentine. If the disease does not yield to these applications, the same treatment as that recommended for RINGWORM must be tried.

SCALDS. See BURNS.

SCALE-ARMOUR consisted of small plates of steel riveted together in a manner resembling the scales of a fish. From the small size of the plates, it possessed considerable pliability, and was therefore a favourite protection for the neck, in the form of a curtain hanging from the helmet. Scale-armour is

now obsolete, except, perhaps, among some eastern potentates.

SCALE INSECT. See COCCUS.

SCALE, MUSICAL, a succession of notes arranged in the order of pitch, and comprising those notes which may occur in a piece of music written in a particular key. The ultimate criterion of what should constitute a musical scale, is doubtless what gives pleasure to a cultivated ear; but the sounds that please the ear are also found to be those that stand in certain simple mathematical relations to each other. Among the ancient Greeks, various different scales or *modes* were in use, of which six were generally enumerated—the Dorian, Phrygian, Lydian, Mixolydian, Ionic, and Æolian. Excepting in the case of the Greek Church and of the Ambrosian Church, modern musical feeling has rejected all of these but two, the Ionic and Æolian, the former of which is now known as the Major, and the latter the Minor Mode. In both modes, the scale consists of a series of seven steps leading from a given note fixed as the tonic or key-note to its octave, which may be extended indefinitely up or down, so long as the sounds continue to be musical.

Major Mode.

Minor Mode.

For an explanation of the principles on which these scales are founded, and of their derivations from the harmonic triad, see MUSIC. The major scale is derived from much simpler proportions than the minor. The minor scale requires to be modified occasionally sharpening its sixth and seventh.

SCALES OF FISHES. They are divided into the *placoid*, *ganoid*, *ctenoid*, and *cycloid*. *Placoid* scales (from the Gr. *platys*, a broad plate) lie side by side without overlapping or imbricating. They are often elevated at the centre so as to form a strong projecting point. All the cartilaginous fishes, except the sturgeon, have placoid scales. *Ganoid* scales (from the Gr.

Fig. 1.—Placoid Scale.

Fig. 2.—Cycloid Scale.

splendour) are covered with a fine enamel, and are generally of a rhomboidal form and imbricated.

SCALES OF NOTATION—SCALIGER.

sturgeon and the bony pike (*Lepidosteus*) have scales of this nature, but the finest examples of these scales are found in fossil fishes. *Ctenoid* scales (from *kteis*, a comb) are generally of a rounded or oval form, with teeth or projections on their posterior margin. They are devoid of enamel, and present an imbricated arrangement. The perch and many osseous fishes possess these scales. *Cycloid* scales (from the Gr. *kyklos*, a circle) consist of concentric layers of horn or bone, without spinous margins, and not covered by enamel. They are soft and flexible, present a variety of linear markings on their upper surface, and usually exhibit an imbricated arrangement. The carp, herring, salmon, &c., possess these scales. In many cases, two kinds of scales occur in the same fish, while in other cases the different species of a single genus exhibit different kinds of scales.

For anatomical details regarding the structure and mode of development of scales, the reader is referred to Professor Huxley's article 'Tegumentary Organs' in the *Cyclopædia of Anatomy and Physiology*, and to Professor Williamson's Memoirs in the *Philosophical Transactions*, 1849—1852. In their chemical composition, the scales of fishes approximate to bone, except that they contain more organic matter. The brilliancy of tint exhibited by many fishes is due apparently to the phenomena of optical interference, rather than to the presence of colouring matter. Figures of Ctenoid and Ganoid Scales are given in the articles CTENOID FISHES and GANOID FISHES.

SCALES OF NOTATION are the various 'radices' which determine, as explained under NOTATION (q. v.), the form and digits of the number expressing any numerical quantity. Thus, the number 289, in the decimal or common system whose radix is 10, signifies 9 units, 8 tens, and 2 hundreds, or $2 \times 10^2 + 8 \times 10 + 9$. To express the same number in the quinary scale, for instance, we must group the 289 units into multiples and powers of 5; an operation which may be performed in either of two ways, as follows:

289	289	2124 (quinary)
57-4	10	5
11-2-4	105 (taking in 5, and	11 (carrying by 10)
1-1-2-4	10 carrying by 5)	5
	2124	57
		5
		289

2124 (i. e., $2 \times 5^3 + 1 \times 5^2 + 2 \times 5 + 4$) in the quinary scale represents the same numerical quantity as 289 in the decimal scale. The following list shows the same numerical quantity according to the radix having for their radices the first 11 numbers ter unity, and will partly indicate the advantages and disadvantages of each scale:

Radix	Scale	Value
Binary	(radix 2)	100,100,001
Ternary	" 3	101,201
Quaternary	" 4	10,201
Quinary	" 5	2,124
Senary	" 6	1,201
Septenary	" 7	563
Octary	" 8	441
Nonary	" 9	351
Decimal	" 10	289
Undenary	" 11	243
Duodecimal	" 12	201

It will be observed that the binary scale possesses only two symbols, 0 and 1, the ternary has 3, while the undenary would require a symbol in addition to the 9 digits and zero to express 10, which is a digit in that scale, and the duodecimal scale two additional symbols for 10 and 11. A glance at the above table shows at once that if the binary scale had been in ordinary use, great facility in the 'performance' of arithmetical operations would have been obtained at the cost of largely increasing their

'extent,' and that both the advantage and disadvantage diminish as we raise the scale. The selection of 'ten' as the ordinary scale is very prevalent, and was evidently suggested by the number of fingers; but the scales of two, three, four, five, six, and twenty have at various times been made use of by a few nations or tribes. The scale of 12 has long been generally employed in business among northern European nations, as is instanced by such terms as 'gross,' signifying 12 times 12, and 'double gross,' denoting 12 times 12 times 12; and it has also been largely introduced into the standard measurements of quantity, as inches, pence, ounces troy, &c., causing a considerable amount of complexity in calculation, as all abstract numerical calculation follows the decimal system. To remedy this acknowledged evil, it has been proposed to introduce the decimal system *in toto*, as has been done in France, Italy, Russia, &c., or else to do the same with the duodecimal system. Those who hold to the first proposal have the argument of conformity in their favour; those who support the latter do so on the ground, that 12 has in proportion far more aliquot parts than 10 has, and that on this account the number of fractions, and the size of each numerator and denominator, would be diminished; while both parties can bring overpowering arguments against the continuance of the present method, or rather want of method. See DECIMAL SYSTEM.

SCALIGER, JULIUS CÆSAR, one of the most famous men of letters that have appeared since their revival, was born in 1484. In after-life, he created for himself a noble pedigree, and made out that he was descended from the princely family of the Scalas of Verona, and that his birthplace was the castle of Riva, on the banks of the Lago di Garda. According to his own account, he was educated first under the famous Fra Giocondo; was afterwards attached as a page to the Emperor Maximilian, whom he attended for 17 years in peace and war; was next made a pensioner of the Duke of Ferrara; thereafter studied at Bologna; commanded a troop of cavalry at Turin under the French viceroy; prosecuted his studies there in philology, philosophy, and medicine; and in 1525 went to Agen, in France, with the bishop of that diocese, a member of the Rovere family, to whose household he became physician. Tiraboschi's account, however, which is the more probable, represents him as having been born at Padua, the son of Benedict Bordoni, who was a geographer and miniature-painter of that city, and who, either from the sign of his shop or the name of the street he lived in, assumed the surname Della Scala. Up to his 42d year, young Giulio Bordoni resided chiefly in Venice or Padua, engaging in the study and practice of medicine, and appearing under his true name as an author. In 1525, he withdrew to Agen, either from some advantageous offer, or with a view to promote his fortune, and there fixed his abode. He became physician to the bishop of the diocese, and in that capacity sought in marriage Andietta de Roques-Lobejac, a young lady only 16 years of age, and of noble and rich parentage. An obstacle was thrown in the way of this alliance; and probably with the purpose of improving his position, and lessening the disparity in station between himself and the object of his affections, he procured, in 1528, letters of naturalisation as a French subject, under the name of Jules-César de Lesclaple de Bordonis. This was probably the occasion when he added Cæsar to his baptismal name of Julius. The marriage took place in 1529, and was both happy and fruitful. He died in 1558, leaving behind him a mass of publications on various subjects, and a reputation for extent and depth of learning, which

considering the ripe age at which he made the majority of his acquirements, redounds to the credit of his vigorous understanding and extraordinary memory. As a thinker, he was more independent than sound; and as a man, was of violently irritable temper and excessive vanity. His best known publications are—*Commentarii in Hippocratis Librum de Insomniis* (Commentaries on the Hippocratic Treatise on Dreams); *De Causis Linguae Latinae Libri XVIII.*, celebrated as the first considerable work written in the Latin language in modern times, and not without value even yet; his Latin translation of Aristotle's *History of Animals*; his *Exercitationum Exotericarum liber quintus decimus de Subtilitate ad Hieronym. Cardanum*; his seven books of *Poetics* (also in Latin, and on the whole his best work); his *Commentaries on Aristotle and Theophrastus*; his two orations against Erasmus; his Latin poems, &c.

SCALIGER, JOSEPH JUSTUS, the tenth son of J. C. Scaliger and Andietta de Roques-Lobejac, and much his father's superior in learning, was born in 1540 at Agen, whence, at the age of 11, he was sent, along with two of his brothers, to the college of Bordeaux, where for three years he studied Latin. A pestilence breaking out in the town, he was recalled by his father, who supplemented the scanty knowledge which his son brought home with him by making him write a Latin declamation every day upon any subject he chose. Under this training, he soon attained great proficiency as a Latinist; and in his 19th year, on the death of his father, he went to Paris, where he studied Greek under the famous Turnebus. He was less indebted, however, to any master than to himself; and finding that his progress was slow under his great preceptor, he closeted himself alone with Homer, and in 21 days read him through, with the aid of a Latin translation, and committed him to memory. In less than four months, he had mastered all the Greek poets. Next, Hebrew, Syriac, Persian, and the most of the modern European languages succumbed in rapid succession to his industry, while at the same time he was assiduous in his composition of verses both in Latin and Greek. About this time, he boasted that he could speak 13 languages, ancient and modern; and such was his ardour in study, that he allowed himself only a few hours' sleep at night, and would frequently pass whole days without rising from his books even for meals. His proficiency in literature, especially in the history, chronology, and antiquities of Greece and Rome, secured him, in 1583, an honourable engagement from Louis de la Roche Pozay, at that time French ambassador at the pontifical court. The year before, however, he had become a Protestant, which rendered it difficult for him to retain an appointment in France. Except that he travelled a good deal, at the generous instance of his patron, and visited the chief universities of France and Germany, and even found his way to Scotland, we know little of his life between 1565 and 1593. He is conjectured to have travelled in Italy, and to have gone as far as Naples. Certain it is, however, that in the year last named he complied with an invitation of the Dutch government, and went to fill the chair of Literature, vacated by Lipsius in Leyden University, where he spent the residue of his days. His labour now consisted chiefly in interpreting and illustrating the classical authors. He died of dropsy on the 21st January 1609, and was never married. We have said that he far excelled his father in learning; but it should be added that he was not a whit less irritable, arrogant, or vain; that he fully shared the paternal pride of pedigree, spurious as he probably knew his own to be; and that he endeavoured to

support his father's genealogical fictions in his well-known letter to Doussa on the splendor of the Scaliger family. His writings abound with expressions of hatred and contempt towards his opponents, and he has enriched the vocabulary of learned abuse to an extent well nigh proverbial. He was, however, a man of immense vigour of undertaking, and must be credited with having been the first to lay down, in his treatise *De Emendatione Temporum* (Paris, 1583), a complete system of chronology formed upon fixed principles. It was this most learned achievement, and his invention of the Julian period, that secured for him the title of the Father of Chronological Science. It was subjected to much emendatory criticism by others like Petavius, and also by himself, its errors having been partly corrected by him in his later work, the *Thesaurus Temporum, complectens Eusebii Paganini Chronicon cum Isagogicis Chronologia Canonibus* (Amst. 1658, 2 vols. fol.). Among the classical authors whom he criticised and annotated are Terence, Seneca (the tragedies), Varro, Ausonius, Catullus, Tibullus, Propertius, Manilius, and Persius. His other works are *De Tribus Sectis Judaicis*; *Dissertationes on Subjects of Antiquity*; *Poetice Epistolae*; a translation into Latin of two centuries of Arabian proverbs, &c. He numbered among his friends the most illustrious scholars of the time, such as Lipsius, Casaubon, Grotius, Heinsius, Dupuy, Saumaise, Vossius, Velsar, P. Pithecius. Interesting notices of him are preserved in his works as the *Huetiana*, and above all, in the 10 vols. of *Scaligerana*, which embody his corrections, and which were collected and published after his death.

SCALLOP, more commonly ESCALOP, is a shell in Heraldry, a species of shell. It has been considered the badge of a pilgrim, and a symbol of the apostle St James the Greater, who is usually represented in the garb of a pilgrim.

SCALLOP-SHELL. See PECTEN.

SCALP, THE, is the term employed to designate the outer covering of the skull or cranium. Except in the fact, that hair in both sexes grows more luxuriantly on the scalp than elsewhere, the skin of the scalp differs so slightly from ordinary skin that it is unnecessary to enter into any detail on this point. But besides the skin, the scalp is composed of the expanded tendon of the occipital frontal muscle, and of intermediate cellular tissue and blood-vessels. Injuries of the scalp, however slight, must be watched with great caution, as they may be followed by erysipelas, or by inflammation and suppuration under the occipital-frontal muscle, or within the cranium, or by suppuration of the veins of the cranial bones, and general pyæmia that may easily prove fatal.—Druitt's *Surgery*, 8th edition, p. 332. In the treatment of a wound of this region, no part of the scalp, however injured it may be, should be removed or torn away; and, if possible, the use of stimulents should be avoided, as plasters and bandages generally suffice to keep the separated parts in apposition. The chance of suppuration may be prevented by coagulating the blood externally, dressing the wound with lint, saturated with *Balsam (Tinctura Benzoin, Comp.)*, so as to separate the injured part from the access of air. The patient should be confined to the house (and in severe cases to bed), should be moderately purged, and fed with non-stimulating, but not too low diet.

Burns of the scalp are very liable to be followed by erysipelas and diffuse inflammation, but the latter is comparatively seldom affected in these cases.

Tumours of the scalp are not uncommon, the most

frequent being the cutaneous cysts popularly known as *Wens* (q. v.), and vascular tumours.

SCAMANDER, the ancient name of a river in the Troad (see TROY), which, according to Homer, was also called Xanthus (Gr. yellow) by the gods, and as a divinity took an important part in the Trojan war, its destructive floods doing serious injury to one party, and thus materially assisting the other. The S. rose in Mount Ida (q. v.), and, flowing west and north-west, discharged itself into the Hellespont, after being joined by the Simois, about two miles from its mouth: the two rivers, however, since the 1st c. A.D., have had separate courses. There has been much controversy as to what modern river corresponds to the ancient S.; Mr C. Maclaren, however, in his *Plains of Troy*, has clearly identified it with the Mendere.

SCAMILLUS, a small plinth below the bases of Ionic, Corinthian, and other columns.

SCAMMONY is a gum-resin of an ashy-gray colour, and rough externally, and having a resinous, splintering fracture. Few drugs are so uniformly adulterated as scammony, which, when pure, contains from 81 to 83 per cent. of resin (which is the active purgative ingredient), 6 or 8 of gum, with a little starch, sand, fibre, and water. The ordinary adulterations are chalk, flour, guaiacum, resin, and gun tragacanth.

Scammony, when pure, is an excellent and trustworthy cathartic of the drastic kind, well adapted for cases of habitual constipation, and as an active purgative for children. The resin of scammony, which is extracted from the crude drug by rectified spirit, possesses the advantage of being always of a nearly uniform strength, and of being almost tasteless. The *Scammony Mixture*, composed of four grains of resin of scammony, triturated with two ounces of milk, until a uniform emulsion is obtained, forms an admirable purgative for young children in doses of half an ounce or more. According to Christian, 'between 7 and 14 grains of resin, in the form of this emulsion, constitute a safe and effectual purgative' for adults. Another popular form for the administration of scammony is the *Compound Powder of Scammony*, composed of scammony, jalap, and ginger, the dose for a child being from 2 to 5 grains, and for an adult from 6 to 12 grains. Scammony is frequently given surreptitiously in the form of biscuit to children troubled with thread-worms.

The plant which produces this valuable drug is *Convolvulus Scammonia* (see CONVOLVULUS), a native of the Levant. It is a perennial, with a thick fleshy tapering root, 3–4 feet long, and 3–4 inches in diameter, which sends up several smooth slender twining stems, with arrow-head-shaped leaves on long stalks. The root is full of an acrid milky juice, which indeed pervades the whole plant. The scammony plant is not cultivated, but the drug is collected from it where it grows wild. The ordinary mode of collecting scammony is by laying bare the upper part of the root, making incisions, and placing shells or small vessels to receive the juice as it flows, which soon dries and hardens in the air.

The name *French* or *Monpellier Scammony* is given to a substance which is prepared in the south of France, chiefly from the juice of *Cynanchum Monspeliacum*, a plant of the natural order *Asclepiaceae*. It is a violent purgative.

SCANDALUM MAGNATUM. This offence was committed in speaking words in derogation of a peer, judge, or great officer of the realm, and a special action was brought for such words, the punishment being damages and imprisonment. But now this proceeding, though not expressly abolished,

is superseded by the ample remedies of Criminal Information (q. v.), indictment, or action. A somewhat similar offence in Scotland is called Leasing-making (q. v.).

SCANDERBEG (properly, *Iskander-beg*, 'the Prince Alexander,' the name given him by the Turks), the famous patriot chief of Epirus, was born in that country in 1414. His real name was George Castriota, and his father, John Castriota, was one of the great lords of Epirus, his mother, Voisava, being a Servian princess. In 1423, he was given as one of the hostages for the obedience of the Albanian chiefs, and his physical beauty and intelligence so pleased Amurath II., that he was lodged in the royal palace, and subsequently circumcised and brought up in Islamism, being also put under the tuition of skilful masters in the Turkish, Arabic, Slav, and Italian languages. In 1433, he greatly distinguished himself in Asia as a Turkish pasha (of one tail); but being offended at the confiscation of his paternal domains, and being solicited by some Epirote friends to return to his native country to aid in the restoration of its independence, he watched an opportunity of withdrawing from the Turkish army. He had not long to wait, for the generous and unsuspecting sultan, who had caused him to be brought up as if he had been his own son, gave him the command of a large division of the army which was destined to act against the Hungarian invaders. S., having concerted his plans with 300 of his fellow-countrymen in the Turkish army, deserted during the confusion of the first battle (1443), and having previously compelled Amurath's secretary (whom he afterwards murdered to avoid detection) to prepare an order investing him with the government of Croia (now *Ak-hissar*), the capital of Epirus, he and his companions fled thither with all possible speed. The unsuspecting governor at once resigned the town into his hands, and was massacred along with the garrison. At the news of S.'s success, the whole country rose in insurrection, and in 30 days he had driven every Turk, except the garrison of Sfetigrad, out of the country. In order to strengthen himself in his new position, he invited a number of the neighbouring princes and Albanian chiefs to a conference, at which it was unanimously agreed to make no terms with the Turks, and to obey S. implicitly as their leader. S. then raised an army of 15,000 men, with which he completely scattered (1444) the 40,000 Turks whom the indignant sultan had sent against him, killing an immense number of them, and taking a few prisoners. Three other Turkish armies shared the same fate, and the 'animus' with which the contest was carried on may be imagined, when we consider that the number of prisoners taken in the last (1448) of these three battles amounted to *seventy-two*. Amurath himself in 1449 took the field, and stormed many of the principal fortresses, but being then ill of his fatal malady, he retired from before Croia, to die at Adrianople (1450). S.'s splendid successes brought in congratulations from the pope and the sovereigns of Italy and Aragon, but many of the Epirote chiefs were becoming wearied of the continual strife, and fell off from him, some of them even joining the Turks. S.'s career was now, in consequence, of a more chequered character, but in spite of occasional defeats, he stoutly refused all the liberal and fair proposals of the sultan, Mohammed II., who had a profound admiration for him, and sheltered by the mountainous nature of the country, carried on an unceasing warfare. At last an annual convention was agreed to in 1461, and S. profited by this leisure to pay off his debt to the pope and the king of Aragon (both of whom had supplied him with material assistance during his greatest need),

and crossing over to Italy, he routed the partisans of Anjou, and restored the kingdom of Naples to the latter of his benefactors, returning home laden with honours and benedictions. At the instigation of the pope, who had tried in vain to raise the other Christian princes of Europe against the Turks, S. broke the armed truce in 1464, and repeatedly defeated the Turks; but Mohammed becoming furious at these unprovoked aggressions, equipped two mighty armies, the first of which invested Croia, and the second, under his own leadership, advanced more leisurely. The first army was, after a desperate contest, defeated by S. in 1466; but the restless and indomitable chief, worn out with the incessant toil of 24 years, died at Alessio, 17th January 1467. The war continued to rage some time longer, but the great mainstay of the country was now wanting, and before the end of 1478, the Turkish standard floated undisturbed over Epirus. Barlesio, a fellow-countryman of S., who has written his biography (*De Vita et Moribus ac rebus gestis Geo. Castrioti*, Rome, 1537), remarks his sobriety, the purity of his manners, and the strictness of his religious belief. He had vanquished the Turks in 22 pitched battles.

SCANDINAVIA, a large peninsula in the north of Europe, bounded on the N. by the Arctic Ocean; on the W. by the Atlantic, North Sea, Skager Rack, Cattegat, and Sound; and on the S. and E. by the Baltic Sea, Gulf of Bothnia and Finland, with which it is connected on the north-east by an isthmus 325 miles wide. This peninsula comprises the two kingdoms, Norway (q.v.) and Sweden (q.v.); is 1240 miles long, from 230 to 460 miles broad, area 300,000 sq. miles. The ridge of mountains which traverses the peninsula in the direction of its length gives character to the whole conformation. The western division of the Scandinavian peninsula is covered with mountains; the eastern half, Sweden, consists principally of low-lying country. The mountains of S. extend from Waranger Fiord, in the extreme north-east, to the promontory of the Naze, in the extreme south-west, with an average breadth of 180 miles. They consist principally of gneiss and micaceous schist, sometimes, but rarely, of porphyry, syenite, granite, and chalk; salt is not found; silver, copper, and iron abound. The Scandinavian Mountains, though forming in reality one great range, are considered as forming four sections—the Lapland Mountains, in the north, from 1000 to 2060 feet high; the Kjölen Mountains, from 1500 to 2575 feet high; the Dovre Fjelde, from 2500 to 3600 feet high; and lastly, the Southern Fjelde, 4000 to 5150 feet high. Though of inconsiderable height, yet the numerous glaciers and snow-fields of the mountains of S. impart to this range almost an Alpine character. The climate of S. is much milder on the west than on the east side, a fact to be ascribed probably to the influence of the Gulf Stream. The character of the country, its physical features, industries, &c., are given under the articles NORWAY and SWEDEN.

The ancient *Scandia*, or S., included Northern Denmark, as well as the peninsula that still retains the name. It is first mentioned by Pliny, who, unaware that the peninsula was attached to Finland on the north, considered S. as an island.

SCANDINAVIAN LANGUAGE AND LITERATURE. The language which was spoken during the heathen ages in all the northern or Scandinavian lands, and which, in accordance with traditional belief, had been introduced by Odin and his companions, when the Gothic tribes supplanted the more ancient races of the Finns and Lapps, is always referred to by the oldest authorities

either as the *Dönsk tunga*, 'Danish tongue,' or as the *Norrœna*, 'Norse.' We never hear of the 'Swedish' or 'Gothic tongue,' and although different dialects no doubt existed, from a very early period, among the Scandinavian people, it is certain that substantially the same language was spoken by the Northmen generally till the 11th century. According to recent inquirers, the race of the Northmen, before their settlement in Sweden and Norway, was divided into an eastern and western branch, the former of which is supposed to have used the language of Norway and Iceland, and the latter the Swedish and Danish dialects. These two divisions of the race had entered Scandinavia by different routes, the eastern having passed along the Gulf of Bothnia, through the country of the Finns and Lapps, while the western branch had crossed from Russia to the Åland Islands, and spread from thence southward and westward; and it seems natural to infer that in their respective lines of migration they may have incorporated into their own speech some of the special characteristics that belonged to the language of the peoples with whom they came in contact. But the differences thus introduced could not have been important; for we find the same language employed in the seven most ancient laws of the different people of Scandinavia, while the two Eddas (q.v.)—the oldest monuments of Scandinavian speech—which were compiled in Iceland, whither the Northmen had carried their language on their settlement in the island in the 9th c., give evidence of an almost complete identity of local and personal names. This unity of language is further proved by the agreement which is found to exist in all runic inscriptions, from Slesvig to the northern parts of Sweden, and from Zealand to the western shores of Iceland. All monuments of this old Northmen tongue would, however, have been lost to us had not the *Norrœna* or Norwegian form of it been carefully preserved and cultivated in Iceland through the short songs (*ljöd* or *quida*) relating to the deeds of the gods and heroes of the north, which had existed as early probably as the 7th c., and had passed with the religion and usages of Norway to the new colony. After the introduction of Christianity into Iceland in the year 1000, schools were founded there, classic literature was cultivated, and Roman characters were adopted for the writing of the national tongue, but this did not interfere with the zeal with which the national laws and poems were collected and studied by native scholars. The literary activity continued unabated till the 12th c., when the republic of Iceland, after having been distracted by the dissensions of the rival aristocratic families of the island, was conquered by Haakon VI., king of Norway. Since 1380, Iceland has formed part of the Danish dominions, and although since that period the colonists have partly succumbed to the cramping influences of the subordinate and dependent conditions in which they have been placed; the distance from the mother country, and the tenacity with which they cling to all memorials of their former history, have enabled them to preserve their language almost unchanged, that the Icelanders of the present day can read the sagas of a thousand years since, and can write in the same phraseology that his forefathers used ages ago. But while the old Scandinavian tongue was thus preserved in the far distant north, it had undergone great changes in Norway; and when, by the union of Calmar in 1380, the latter country was united to Denmark, the Danish form of speech, that had in the meanwhile been changing under the modifying influences due to the introduction of Latin and to contact with other nations

supplanted the Norwegian language, which thenceforth being banished from the pulpit, the law courts, and from literature, split up into numerous dialects peculiar to special valleys and fjords, but unknown in the larger towns.

When we come to examine the Icelandic or ancient Scandinavian, which is closely allied to its sister Teutonic languages, and like them betrays its eastern origin, we find that it differs from the latter in several important points. It has this striking peculiarity, that the definite article, instead of coming before the noun, is appended as a termination to the end of the word. The adjective, moreover, which in its indefinite form is subject to inflections, for all genders and cases, undergoes, when in its definite form, fewer and slighter changes. Again, while in the German tongues the verb in the infinitive ends in a consonant, in the old Scandinavian it invariably terminates in a vowel. The old Scandinavian language has a passive form of the verb unknown to its Gothic sister tongues; and while in German the third person of the present tense differs from the second person, such is not the case in Old Northern. In the latter, the vowel sounds are greatly modified by a very perfect system of combinations, indicated by dots or accents; and in addition to the consonants of the Gothic languages, it has an aspirated *d* and *t*. It possesses, moreover, a flexibility and richness of construction, which admit of favourable comparison with those of the ancient classical languages, while in regard to the number and comprehensiveness of its words, and its consequent independence of foreign derivatives, it presents a character of regularity and unity which is wanting to the other Germanic languages. Its mode of construction is simple in prose, and in the earlier forms of poetry, although in the later periods of the Skalds (q.v.) it degenerated into a state of artificial complexity. The chief feature of the metrical system employed in Old Northern poetry was alliteration (q.v.). The alliterative method was continued after the introduction of terminal rhyme, but the simplicity of the ancient lay gave way in the 10th c. to the most artificial complexity of versification in the metres invented by the skalds. Besides these skaldic measures, of which 106 are enumerated in the *Hattalykki*, or Key of Metres, drawn up in the 13th c. by the Icelandic, Snorri Sturluson (q.v.), the skalds were required to know the *Kenningar*, or poetic synonyms, of which there were an enormous number; some words, as Odin, island, &c., having upwards of 100. The main feature of the system was that nothing must be called by its right name: thus a ship was a beast of the sea, a serpent of the waters, a dragon of the ocean, &c.; a woman was a graceful tree, a fair pearl, &c.; a wife was her husband's *Rune* (q.v.), or his confidential and intimate friend, &c.

The fragments of Old Northern poetry that have come down to us in the *Eddas*, belong for the most part to the 8th c., or even perhaps to the 7th c.; and consist of short songs (*ljöd* or *quida*), which are either mystic, didactic, mythic, or mytho-historic in their character. See *EDDA*. It is supposed that some of these compositions, and several of the poems which celebrate the adventures of the gods, giants, and elves, were composed prior to the immigration into Scandinavia of Odin and his followers; while, on the other hand, the local colouring of others sufficiently prove their northern origin. In addition to the subjects belonging to the Odinic mythology, we have in the mytho-historic lays, known as the songs of the famous Smith *Völundr*, or the *Völundar-quida*, a cyclus of heroic poems similar to the Old German epic the *Nibelungenlied*, (q.v.); but much more ancient in form than that in

which the latter has reached us. In the 9th and 10th centuries the ancient epic and the simple songs of the older poets gave place to the artificial poetry of the skalds, which, from its earliest development, manifested a realistic tendency, and made the real adventures of living men the subject of their compositions. Many of these compositions, as the *Eiríksmál*, or the Death and Apotheosis of King Eric Blood-axe, who died in 952; the *Hakonar-mál*, or Fall of Hakon the Good; and several poems by the famous Icelandic skald Egill Skallagrímson, while they afford valuable materials for the early history of the north, are among the latest of the skaldic productions that preceded the more degenerate periods of the art. To the 11th and 12th centuries belong the poems known as *Grongaldr* and *Solar-ljóð*, which were composed in imitation of the ancient compositions, and consist of moral and didactic maxims, the former conceived from an assumed heathen, and the latter from a Christian point of view. In the 13th c., the skaldic art thoroughly declined, and gave place, in Iceland, to a puerile literature, based upon Biblical stories and saints' legends. In Scandinavia Proper, a more modern form of national literature was in the meanwhile being gradually developed by means of oral transmission, whence arose the folk-lore and popular songs of Norway and Sweden, and the noble Danish ballads known as the *Kæmpe viser*, whose composition in the Old Northern or Icelandic tongue may probably be referred to the 14th century. The earliest Icelandic prose belongs to the beginning of the 12th c., when Ari 'hinns Frode,' or the Wise, composed a history of his native island and its population in the *Íslendinga-bók* and *Landnámabók*, the latter of which was continued by others. He was the first northern writer who attempted to assign fixed dates to events by reference to a definite chronology, and his work is remarkable as the earliest historical composition written in the old Danish or Norse, as it still remains in the living language of Iceland. These works, which have since perished, entered largely into the composition of the annals of the early kings of Norway, compiled a century later by Snorri Sturluson under the title of the *Heimskringla*. Throughout the middle ages the literature of Iceland was enriched with numerous national and other sagas, the materials of which were drawn from skaldic songs, folk-lore, local traditions and family histories; and in its later stages of development included among its subjects the mythic cycle of Arthur and his knights, Merlin, Alexander, Charlemagne, &c. The compilation of the laws of the island attracted the attention of the Icelanders at an early period; and in 1118 a complete code, known as the *Gragas*, which had been derived from the ancient Norse law, was submitted to the All-thing or popular assembly, and a few years later the canons of the church, or the *Kristinnrettir*, were settled and reduced to writing. A collection of those enactments in the ancient and subsequent codes, which are still in force in Iceland, has been made by Stephensen and Sigurdsson (Copen. 1853), under the title of *Lagasöfn handa Íslendi*; while the ancient Norse laws, beginning with the *Gula-things-lög* and the *Hirdskra* of Hakon the Good, which date from the 10th c., have been ably and critically edited in Norway under the title of *Norges gamle Love* (Christ. 1846—1849). The study of the Old Northern language and literature, which was successfully inaugurated by the native scholars of Iceland in the 17th c., was soon prosecuted with equally happy results in Denmark and Sweden, and within the last 20 years in Norway, where the subject forms a necessary introduction to the investigation of the language and history of the

country. Copenhagen has, however, in recent times, been the principal seat of these inquiries, the successful prosecution of which has been materially facilitated by the large number of important Icelandic MSS. contained in its libraries, and by the foundation of the Arne-Magnussen collection in 1772; and the different societies especially designed to promote the study of Icelandic and of northern antiquarian monuments. Among the Icelandic and Danish scholars who have gained pre-eminent distinction in these departments of research, we may instance Arne-Magnussen, Torfæus, Olavsen, Finn Magnussen, Worm, Resenius, Bartholin, Thorlacius, Müller, Rask, Rafn, Keyser, Munch, Unger, Lange, &c. In the study of the grammar and comparative structure of the language, which excited an interest as early as the 13th c., as is proved by the grammatical treatises and rules of prosody incorporated in the younger *Edda*, no one has evinced a higher order of scientific acumen and critical learning than Rask (q. v.), who in his erudite work *Om det gamle Nordiske Sprogs Oprindelse* (Kjöpenh. 1818) threw a flood of new and important light on the subject; while the labours of Jakob Grimm, Munch, and others, have tended materially to exhibit the affinities between the Old Northern and the Teutonic languages, and to assign to it its right position among the kindred Indo-Germanic tongues.

SCANDINAVIAN MYTHOLOGY. Our knowledge of Scandinavian mythology is mainly derived from the collections of ancient Northern sagas known as the *Eddas* (q. v.), which constitute the *Odinic Bible*, as it were, of heathen Scandinavia. The value and interest attaching to these records of the ancient faith of the Northmen are enhanced by the fact that there are strong grounds for assuming that the closest affinity, if not identity, of character existed between their religious doctrines and practices and those of the Germanic nations generally. Hence, in the absence of anything beyond the incidental notices of the Pagan religion of Germany, which are contained in the classic writers, the *Eddaic* exposition of northern mythology is of the highest importance to the student of the history of every nation of Teutonic origin. Owing to the remote situation of the Scandinavian lands, and the hold which the *Odin* religion had taken of the minds of the Northmen—whose natural tendencies inclined more to the Pagan merits of valour, courageous endurance of hardships, indomitable resolution, and unflinching fidelity in hate and love, than to the Christian virtues of submission, meekness, and forgiveness of injuries—Christianity took root slowly and insecurely in those lands, and only long after a national literature, based upon the superstitions and memorials of the ancient faith, had been firmly established among the people. But although there is every reason to believe that all branches of the great Indo-Germanic family of nations had essentially the same system of belief and worship, and venerated the same deities, minor differences were numerous. Thus, for instance, while Danes, Saxons, and Gothlanders worshipped *Odin* as their chief god, the Swedes generally paid supreme honours to *Frey*, the god of the year; some tribes of Northern Germany regarded *Hlodyn*, or the Earth, as their principal deity; and the Norwegians directed their worship to *Odin's* son, *Thor*; while in some parts of Norway even, as in *Halgoland*, the people worshipped deities not honoured elsewhere in Scandinavia. Thus the chief objects of worship in the latter district were *Thorgerd*, *Horgabrud*, and *Irpa*, the daughters of *Halogi*, or high flame, from whom the name of the country was derived, and who was probably identical with *Loki* (Fire), who, after having, according to the myth, been beneficent in

the beginning of time and united with the All-father, fell from his high estate, and, like some fallen angel, became crafty, evil, and destructive as a desolating flame. *Halgoland* appears from remains discovered there to have been a special seat of fire or sun worship, which seems to have been nearly universal at one period of the world's history.

Leaving for the present the discussion of the sources from whence the northern mythology derived some of the numerous complex elements which entered into its composition, we proceed to give a short summary of its cosmogony:—In the beginning of time a world existed in the north called *Niflheim*, in the middle of which was a well, *Hvergelmeer*, from which sprang twelve rivers. In the south was another world, *Muspelheim*, a light, warm, radiant world, the boundary of which was guarded by *Surt* with a flaming sword. Cold and heat contended together. From *Niflheim* flowed venomous, cold streams called *Elivæger*, which, hardening into ice, formed one icy layer upon the other within the abysses of abysses that faced the north, and was known as the *Ginnunga-gap*. From the south streamed forth the sparkling heat of *Muspelheim*; and as heat met cold, the melting ice-drops became instinct with life, and produced, through the power of him who had set forth heat, a human being, *Ymir*, the progenitor of the frost-giants, by whom he was called (*Ergelmer*, or *Chaos*). He was not a god, but evil, both befitting all his race. As yet there was neither heaven nor earth, neither land nor sea, but only the abyss *Ginnunga-gap*. *Ymir* drew his nourishment from the four milky streams which flowed from the udders of the cow *Aedhumla*, a creature formed from the melting frost. From *Ymir* there came forth offspring while he slept—a man and woman growing from under his left arm, and sons from his feet; and thus was generated the race of the frost-giants, or *Hrimthursar*, among whom the All-father dwelt in the beginning of time before the heaven and the earth were created.

In the meanwhile, as the cow *Aedhumla* licked the frost-covered stones, there came forth the first day a man's hair, the second day a head, and on the third day an entire man. This man, *Buri*, or *Producing*, had a son *Borr* (the *Produced*), who married *Beltsa*, one of the giant race, by whom he had three sons, *Odin*, *Vili*, and *Ve*.

These three brothers, who were gods, slew *Ymir* and carrying his body into the middle of *Ginnunga-gap*, formed from it the earth and the heavens. Of his blood they made all seas and waters, taking the gore that flowed from his body to form the impassable ocean which encircles the earth; of his bones they made the mountains, using the broken splinters and his teeth for the stones and pebbles; of his skull they formed the heavens, at each of the four corners of which stood a dwarf, viz., *Austri* at the east, *Vestri* at the west, *Northri* at the north, and *Suthri* at the south. Of his brains they formed the heavy clouds, of his hair plants and herbs of every kind, and of his eyebrows they made a wall of defence against the giants round *Midgard*, the central garden or dwelling-place for the sons of men. Then the three brothers took the glowing sparks that were thrown out of the world *Muspelheim*, and casting them over the face of heaven, raised the sun, moon, stars, and fiery meteors, and appointed to each its place and allotted course; and thus arose days, months, and years.

Night was of the race of the giants, and in time married three husbands, by one of whom she had a daughter, *Earth*, and by another a son, *Day*, who was bright and beautiful like the gods, or *Æsir*, whose race his father *Delling* belonged. To this

SCANDINAVIAN MYTHOLOGY.

mother and son, who were akin to the opposite races of the frost-giants and the gods, Allfader committed chariots and horses, and placed them in heaven, where Night rides first through her twenty-four hours' course round the earth with her horse Hrimfaxi, from whose bit fall the rime-drops that each morning bedew the face of the earth. Close after her comes her fair son Day, with his horse Skinfaxi, from whose shining mane light beams over heaven and earth. All the maidens of giant race were not dark like Night, for to Mundilfori were born a son and daughter of such beauty that their father gave to them the names of Mani or Moon, and Sol or Sun. The gods, incensed at this presumption, took them up to heaven, and ordained that they should direct the course of the sun and moon, which had been made to give light to the world, and thenceforth Sol drove the chariot of the Sun, which was drawn by two horses, Arvakur (the Watchful) and Alsvith (the Rapid), under whose shoulders the gods in pity placed an ice-cool breeze. A shield named Svalin (the Cooling) was also by their care attached to the front of the car, to save sea and land from being set on fire. Mani directs the course of the moon, and he, like his sister, is followed by a wolf that seems about to devour him; and in the end of time this animal, which is of giant race, will with his kindred swallow up the moon, darken the brightness of the sun, let loose the howling winds, and sate himself with the blood of all dying men.

When heaven and earth were thus formed, and all things arranged in their due order, the chief gods or Æsir, of whom there were twelve, met in the middle of their city Asgard, which lay on the plain of Ida. These gods were Odin, or All-father, who has twelve names in Asgard besides many others on earth; Thor, Baldur, Tyr, Bragi, Heimdal, Hod, Vidar and Vali his sons, and Niord, Frey, Ull, and Forsetti. Here they raised for themselves a court with a high seat for All-fader; a lofty hall for the goddesses; and a smithy, in which they worked in metal, stone, and wood, but chiefly in gold, of which precious substance all the implements which they used were made, and hence this period of their existence was known as the Golden Age.

This age of peaceful labour lasted till three beautiful, but evil maidens made their way from the giants' world, Jotunheim, to Asgard, when confusion and ill-will arose in the world. Then the gods, taking counsel, determined to create new beings to people the universe, and first they gave human bodies and understanding to the dwarfs, who had been generated like maggots within the dead body of Ymir, but who now took up their abodes in the bowels of the earth, in rocks and stones, and in trees and flowers. Then Odin, with two companions, Hœnir and Lodur, went forth on an excursion to the earth, where finding two trees, Ask and Embla, created a man and a woman of them, Odin giving them spirit or the breath of life, Hœnir sense and motion, and Lodur blood and a fair colour, with sight, speech, and hearing; and from this pair, whose dwelling was in Midgard, the human race has sprung. A bridge of three colours, Bifrost, known to men as the rainbow, connects Midgard with Asgard, and over this the gods ride daily on their horses to the sacred fountain of Urd, where they sit in judgment. This fountain lies at one of the three roots of the ash, Yggdraail, whose branches spread over the whole world and tower above the heavens. Under one of these roots is the abode of Hel (q. v.), the goddess of the dead, under another, that of the frost-giants, while under the third is the dwelling of human beings. Below the tree lies the serpent Nidhogg, who is constantly

gnawing the roots, and striving with his numerous brood of lesser serpents to undermine Yggdraail, whose branches are as constantly refreshed by water from the well of Urd, which is poured over them by the Norna. These are three maidens known as Urd, Verdandi, and Skuld (or Past, Present, and Future), who dwell in a fair hall below the ash-tree, where they grave on a shield the destiny which they determine for the children of men.

Besides gods, frost-giants, dwarfs, and men, there were other beings, as the Vanir, who dwelt in the world Vanahheim, lying between the abodes of the gods and of men, and the Light Elves and Dark Elves, the former of whom were friendly to mankind, and of great beauty, while the latter were of evil demoniacal natures, and blacker than pitch.

Now, after the three giant maidens came to Asaborg, dissensions soon broke out among these different races, and Odin, by casting a spear among mankind, created war and discord in the world. Then his maidens, the Valkyriur (or choosers of the doomed), surrounded by lightnings, rode forth with bloody corselets and radiant spears, to choose on every battle-field those who should fall, and to lead them into Valhal, where the chosen heroes, known as Einheriar, daily go forth to fight and slay one another, but returning at early morn sound and fresh, recruit themselves for the next night's combats by drinking beer with the gods and eating the flesh of the sacred hog. It is, however, only men of rank, as jarls (or earls), who enter Odin's hall after death, for the base-born, or thralls, belong to Odin's powerful son, Thor (q. v.), who rules over Thrudheim, and drives through the world in a chariot drawn by he-goats, bearing with him his magic hammer Mjolnir, the iron gloves which he requires to grasp the haft, and his belt of power.

Among the gods there reigned good-will and happiness even after the rest of the world had been disturbed by war, until Loki, or the impersonation of evil, who in infancy had been Odin's foster-brother, was admitted into Asaborg as their equal. By his treachery Baldur (q. v.), the purest, most beautiful, and best loved of Odin's sons, was slain. The gods, indeed, had power to inflict temporary punishment on Loki, and to chain him under a hot sulphur spring, where he lay for ages, but at length a time will come when Loki's evil progeny will prevail over the gods and the world. This terrible age of destruction, the Ragnarök, or twilight of the gods, will be marked by a three years' winter of hard frost, cutting winds, and sunless air uncheered by summer or spring-tide, when there will be bloodshed throughout the world, brothers will slay one another, parents and children will be at war. The wolf Fenrir will break loose, the sea will burst its bounds as the serpent Jormundgard, encircling Midgard, writhes in fierce rage, and struggles to reach the land. The wolf Sküll will swallow up the sun, and when the world is plunged in almost total darkness, his brother Hati will devour the moon, while the stars will vanish from heaven. As Midgard's serpent and the wolf Fenrir go forth, scattering venom through air and water, the heavens will be rent asunder; the ship Naglfar, which is made of dead men's nails, will be floated on the waters; the Æsir will ride forth across the bridge Bifrost, which will break away behind them; and all the friends of Hel, led on by Loki, will offer battle to the gods on Vigrid's plain. Then Odin, having taken counsel at Mimir's well, will advance armed with his spear Gungnir against the wolf Fenrir, while Thor encounters Midgard's serpent, and is killed by the venom which it exhales from its mouth. Although Fenrir, the wolf, will swallow Odin, and thus cause his death, he will

himself be slain by the god Vidar, while Loki will fall beneath the hand of Heimdal, the watchman of the gods, and Surt, hurling fire from his hand, will burn up the whole world. After the conflagration of heaven and earth and the whole universe, there will still be dwellings for the evil and the good, the worst of which is Nastrond, a horrible habitation for perjurers and murderers, where serpent-heads pouring forth venom line the walls, while in Gimli, Odin's best heaven, the good and virtuous will find a happy resting-place.

But from the great destruction of the universe another earth, verdant and fresh, will arise from the deep waters of the ocean, the unsown fields will bear fruits, and all evil will cease; Baldur and other gods will then return to Ida's plain, where Asgard once stood, and taking counsel together, will find the golden tablets which their race had possessed at the beginning of time, and remembering their deeds of old, will await the coming of the mighty All-father, the ruler of all things, who will pronounce judgments, and establish peace that shall endure to the end of time.

The above brief epitome of the Odin cosmogony serves as a framework for the numerous beautiful prose and poetic myths which make up the substance of northern mythology; and are contained in a rich mass of sagas, not all complete in themselves, but each capable of throwing some light on the others.

Many theories have been advanced to explain the origin and the fundamental ideas on which the northern myths have been based; and while some expositors have seen in them a mere re-clothing of Bible narratives, and a perversion of Christian truths, and have referred their composition to monks living in the middle ages, others, feeling that their title to antiquity could not be set aside, have gone to the other extreme, and tried to prove that they reflected the truths of Christianity, and represented under active and tangible forms the mysteries of Revelation; and that thus, for instance, in the narrative of Thor crushing the serpent we have a figurative delineation of Christ. Other interpreters, again, have attached very different meanings to these myths, regarding them as historic, psychical, physical, or even chemical; but against each of these assumed modes of explanation, taken in their full integrity, conclusive arguments might be adduced; and all that can be safely accepted is, that they are partly historical and partly an impersonation of the active forces of nature. Like the northern languages, their original seat was in the south and east, where kindred mythologies existed among the ancient tribes of India and Persia; and it is probable that the more practical and energetic spirit of the northern myths, and the more warlike character of the gods of the north, when compared with the reflective and contemplative nature of their oriental prototypes, may be due to the gradual effect on the minds of a people who had passed from the soft enervating influences of a southern climate to the stern rigours of the north, where man lived in constant warfare with the elements and with his fellow-men. According to Snorri Sturlesson (q. v.), whose opinion seems to a certain extent to have been a mere re-echo of the traditional belief of his forefathers, Odin and his sons and companions were earthly kings and priests of a sacerdotal caste, who had migrated from Asia—perhaps, as some conjectured, from Troy—and who conquered and ruled over various parts of Scandinavia and Northern Germany, where after their death they were regarded by the people as deities. In conjunction with this mode of representation, the mythic tales of the warfare of the gods with giants, their intercourse with dwarfs, and

spirits of the air and water, and their wanderings on earth, are interpreted as memorials of real war with pre-existing races, and of the spread of Odin's religion from its chief seat in Sweden over the neighbouring countries. This theory explains only a few of the myths; while some, as we have already observed, may be referred to traces of an older faith which lingered amongst the Finns and Lapps after the advance of the more civilized conquering races had driven those tribes from the southern districts of Scandinavia, which they originally occupied, to the barren recesses of the north.

The worship of the gods was celebrated either in spacious temples, of which there were many in different parts of Scandinavia, or on stone heaps or altars, known as *horgs*. These altars were always near some well, and close to a sacred grove, or a solitary tree, on which the votive offerings were suspended, after they had been washed at the neighbouring spring by the attendant priestesses, known as *horgabrudar*. Human sacrifices, although never resorted to on ordinary occasions, were not uncommon in times of public calamity, arising from war, failure of crops, disease, &c.; and the horse, whose flesh was highly esteemed, was a frequent victim, while the fruits of the earth and spoils of war were the usual offerings. Three great festivals were held every year, the first of which was celebrated at the new year in the Yule month, was Thorablot, or the sacrifice of Thorri, an ancient god of the Finns and Lapps, was offered. On these occasions, offerings were made to Odin for success in war, and to Frey for a fruitful year, the chief victim being a hog, which was sacred to the latter god, on the assumption that swine first taught mankind to plough the earth. Feastings and Yule-games occupied the whole of the month, whence it was also called the Merry Month. The second festival was in mid-winter, and the third in spring when Odin was chiefly invoked for prosperity and victory on the Vikings, or sea-roving expeditions which were then entered upon. On the introduction of Christianity, the people were the more ready to conform to the great church festivals of Christmas and Easter, from the fact of their correspondence with the ancient national sacrificial feasts; and so deep-rooted was the adhesion to the faith of Odin in the north, that the early Christian teachers were unable to eradicate the old ideas, were driven to the expedient of trying to give them a colouring of Christianity. Thus the black elves, giants, and subterranean sprites, and dwarfs, with which the Northmen peopled earth, air, and water, were declared by them to be fallen angels or devils; and under the latter character suffered to retain the old denominations. Belief in these imaginary beings survived the spread of the Reformation, and scarcely be said to have died out in Scandinavian lands among the superstitious and ignorant, while among the more enlightened the myths connect with them are still related, and serve to give poetic interest to special localities.

Our own association with the Scandinavian mythology is perpetuated in numerous superstitions and usages still lingering amongst us, as in the names of the days of the week. See *WEEK*.

The best northern authorities on Scandinavian mythology are N. M. Petersen, *Danmarks Historie i Hedenold* (1837); Rask, in his edition of *Samas Edda*; Jakob Grimm, *Deutsche Mythologie*; Fausbøll, *Norske Folke-Sang*; Thorpe, *Northern Mythology* (Lond. 1851).

SCANSO'RES. See *CLIMBERS*.

SCANTLING, the sectional breadth and thickness of timbers for roofs, floors, &c. The term is

SCAPHOID BONE—SCARABÆUS.

also applied to quarterings or pieces of timber of about five inches in thickness and under.

SCAPHOID BONE (Gr. *skaphe*, a boat), a term applied to two somewhat boat-like bones, of which one occurs in the carpus or wrist (see **HAND**), and the other in the tarsus of the Foot (q. v.).

SCAPPLE, a kind of work applied to masonry. To scapple a stone, is to work the surface even without making it smooth.

SCAPULA, THE, or **SHOULDER BLADE**, is a flat triangular bone, which, when the arm hangs loosely down, extends posteriorly and laterally from the first to about the seventh rib. It presents for examination an outer convex and an inner, smooth, and concave surface, three orders (a superior, an inferior or axillary, and posterior), three angles, and certain outstanding processes.

The figure represents an outer or posterior view of the scapula. It is divided into two unequal

A Posterior View of the Left Scapula :

The parts designated by the figures 1, 2, 4, 6, 8, 10, 11, 12, are sufficiently described in the text; 3 is the superior border; 5, the anterior or axillary border; 7, the inferior angle; 9, the posterior border or base; 13, one of the nutritious foramina; 14, the coracoid process. (From Wilson's *Anatomist's Vade Mecum*.)

parts, the supra-spinous fossa (1), and the infra-spinous fossa (2), by the spine (10), a crest of bone commencing at a smooth triangular surface (11) on the posterior border, and running across towards the upper part of the neck of the scapula (8), after which it alters its direction, and projects forwards so as to form a lofty arch, known as the acromion process (12), which overhangs the glenoid cavity (6), or receptacle for the head of the humerus, or main bone of the arm. This acromion (so called from the Greek words *acros* *omos*, the summit of the shoulder) obviously serves to protect the shoulder joint, as well as to give great leverage to the deltoid muscle which raises the arm. It is this process which gives to the shoulder its natural roundness. From the upper part of the neck (8) there proceeds a remarkable curved projection termed the coracoid process, from its supposed resemblance to the beak of a raven (Gr. *kôrax*). It is about two inches long, and gives attachments to several muscles. The upper border of the scapula presents a very remarkable notch (4), which in the recent state is bridged over with a ligament, and gives passage to the supra-scapular nerve. This bone articulates with the

clavicle and humerus, and gives attachment to no less than 16 muscles, many of which, as the biceps, triceps, deltoid, serratus magnus, are very powerful and important.

The uses of this bone may be stated as follows: 1. It connects the upper extremity to the trunk, and participates in, and is subservient to many of the movements enjoyed by the arm; 2. By its extended flat surface it furnishes a lateral protection to the chest; and 3. It affords attachments to various muscles which modify the size of the thoracic cavity, and is thus concerned in the process of respiration.

SCAPULAR, or **SCAPULARY** (Lat. *scapula*, the shoulder), a portion of the monastic habit, so called from its being worn upon the shoulders. It consists of a long stripe of serge or stuff, the centre of which passes over the head, one flap hanging down in front, the other upon the back. The scapular of the professed monks in most orders reaches to the feet, that of the lay brothers only to the knees. The colour differs for different religious orders or congregations. Besides the scapular worn by the members of religious orders strictly so called, there exists also in the Roman Catholic Church a religious association or confraternity, the members of which, while living in the world and mixing in ordinary life, wear, although not conspicuously, a small religious emblem called a scapular. The chief duties of this confraternity consist in the recitation of certain prayers, or the observance of certain religious or ascetical exercises through devotion to the Blessed Virgin. The members may or may not bind themselves by a vow of chastity. This pious association was founded in the middle of the 13th c. by an English Carmelite friar named Simon Stock, and is said to have originated in a vision, which has been the subject of much controversy, as well with Protestants as among Catholics themselves.

SCARABÆIDÆ, a very numerous tribe of lamellicorn coleopterous insects (see **LAMELLICORNÆ**), of which more than 3000 species are known, the greater number inhabitants of tropical countries, although species are found in almost all parts of the world. Some of the tropical species are amongst the largest of beetles; those found in colder regions, as in Britain, are of comparatively small size. The tribe is divided into six sections: *Coprophagi* (dung-eaters), *Arenicoli* (dwellers in sand), *Xylophili* (delighting in wood), *Phyllophagi* (leaf-eaters), *Anthobi* (living on flowers), and *Meliophili* (delighting in honey), named according to prevalent and characteristic habits of the species belonging to them, although the names do not accurately denote the habits of all the species of each section. The sections are distinguished by differences in the organs of the mouth and the antennæ. To the section *Crotophagi* belong the greater number of the Dung Beetles (q. v.), or Scavenger Beetles, so useful in warm countries in removing offensive matter; amongst which is the Sacred *Scarabæus* of the ancient Egyptians (*Scarabæus*, or *Ateuchus sacer*). Some of the *Xylophili*, as the great Hercules Beetle (q. v.), have remarkable projections from the head or the thorax of the males. The Cockchafer (q. v.) is an example of the *Phyllophagi*; the Goliath Beetle (q. v.) is one of the *Meliophili*, to which section the Rose Beetle, common in Britain, also belongs. None of the *Anthobi* are British.

SCARABÆUS, the name of a beetle held sacred by the Egyptians, commonly known in entomology as the *Scarabæus* or *Ateuchus sacer*. It was called *Heliocantharus* or *Cantharus*, by the Greeks, and

S. by the Latins. Scarabæi were employed for rings, necklaces, and other purposes by the Egyptians, Phœnicians, and Etruscans (see GRMS). These are principally distinguished by the absence or presence of striated elytra and other marks. Entomologists have recognised four distinct species of the *Ateuchus* on the Egyptian monuments, viz., *A. semipunctatus*, *A. laticollis*, *A. morbillosus*, *A. puncticollis*. Several mystical ideas were attributed to the S.: the number of its toes, 30,

Scarabæus.

symbolised the days of the month; the time it deposited its ball in which its eggs were deposited, was supposed to refer to the lunar month; the movement of the clay-ball referred to the action of the sun on the earth, and personified that luminary. The S. was supposed to be only of the male sex, hence it signified the self-existent, self-begotten, generation or metamorphosis, and the male or paternal principle of nature. In this sense it appears on the head of the pygmean deity, Ptah-Socharis Osiris, the demiurgos, and in astronomical scenes and sepulchral formulas. In the hieroglyphs it is used for the syllable *khepri*, and expresses the verb 'to be, exist.' In connection with Egyptian notions, the Gnostics and some of the Fathers called Christ the scarabæus. The insect, during its life, was worshipped, and after death, embalmed.—*Horapollo*, i. c. 10; *Ælian*, *De Nat. Anim.* x. 15; Pettigrew, *History of Mummies*, p. 221; Wilkinson, *Man. and Cust.* v. p. 255.

SCARAMOUCH (Ital. *scaramuccia*, skirmish), a character in the old Italian comedy, originally derived from Spain, representing a military poltroon and braggadocio. He was dressed in a sort of Hispano-Neapolitan costume, including a black *toque* and mantle, and a mask open on the forehead, cheeks, and chin, and always received an inglorious drubbing at the hands of harlequin.

SCARBOROUGH (i. e., fortified rock), a seaport and municipal and parliamentary borough in Yorkshire, in the East Riding, 42 miles north-east of York, and about 20 miles north-west of Flamborough Head. It is built around a charming bay open to the south and south-west, and protected on the north-east by a promontory ending in a castle-crowned height, which looks out on the North Sea. From the sands the town has gradually climbed the rising ground behind in successive terraces and crescents. The chief buildings are churches, chapels, and benevolent and other institutions, with which the town is well furnished. A fine cast-iron bridge, 75 feet high, and stretching over a chasm 400 feet wide, connects the old and new towns, and leads to the spa, and a bridge has recently (1865) been erected over a picturesque ravine to connect the western part of the town with its large and fashionable southern suburb. The springs, which are saline and chalybeate, are on the margin of the sea, and are surrounded by walks and ornamental grounds. The harbour, composed of three piers, and furnished with a light-house, is the most important in this part of the east coast. Every accommodation is offered to visitors for sea-bathing, and S. is reputed the most fashionable watering-place on the north-east coast. The season lasts from June to the middle of October. In 1872, 284 vessels, of 18,699 tons, entered and cleared the port. Pop. (1871) 24,259. The castle was erected about the year 1136. It was held against the barons by Piers Gaveston, who, however, surrendered, and was afterwards beheaded. It was twice besieged by the parliamentary forces.

At present, it serves as a barrack, and is fortified by batteries.

SCARCEMENT, a plain set-off or projection of a wall; foundations have generally one or more scarcements.

SCARF, in Heraldry, a small ecclesiastical banner suspended from the top of a crossier.

SCARFING, the junction of two pieces of timber made to overlap, and united so as to appear as one piece.

SCARLATINA, or SCARLET FEVER, is one of the group of diseases called Exanthemata. In addition to the characters common to the group, scarlatina is almost always attended by sore throat, and the rash or eruption, which is of bright scarlet colour, commonly appears as early as the second day after the manifestation of the febrile symptoms, and ends in desquamation of the cuticle on the seventh day. Most writers on medicine make several varieties of this disease—viz., *S. simplex*, in which there are the fever and the rash, but scarcely a throat-affection; *S. anginosa*, in which, in addition to the fever and the rash, the throat-affection is the most prominent symptom; and *S. maligna*, a name which is applied to certain cases of extreme violence, in which the system is at once overwhelmed by the force of the disease, or in which the symptoms evince an extraordinary degree of weakness and want of vital power.

The disease begins with shivering, lassitude, headache, a frequent pulse, a hot dry skin, a dry face, thirst, loss of appetite, and a furred tongue. Shortly after the appearance of the febrile symptoms, the throat begins to feel irritable, and on examination, is found to be red, and often more or less swollen. This redness becomes diffused to the interior of the mouth, and the tongue. The rash begins in the form of minute red points, which soon become so numerous that the surface appears of an almost uniform red. It first appears on the neck, face, and breast, whence it gradually spreads over the trunk and extremities. The redness of the face is smooth to the touch, and the colour temporarily disappears on pressure of the finger. Along with the true rash, minute vesicles, known as *antraxina* (q. v.), sometimes occur. The eruption in ordinary cases, is persistent for three or four days after which it gradually disappears, and is gone by the end of the seventh day. The crust then begins to scale off in small bran-like scales in flakes of various sizes. Specimens of an entire epidermic covering of the hand or foot, forming a natural glove or slipper, are of common occurrence in our pathological museums; but it is comparatively seldom that such perfect moulting takes place. The desquamative process is usually completed in a fortnight, or rather later from the commencement of the disease. The fever does not abate on the appearance of the rash, but continues in a more or less decided manner through the progress of the case; it often presents exacerbations towards the evening, and is occasionally attended with delirium, or even with convulsions. If the urine be examined, both chemically and microscopically, a few days after desquamation has set in, it will be found to contain albumen, and to exhibit a large amount of epithelium from the uriniferous ducts of the kidneys (q. v.).

Malignant *Scarlatina* is so terrible a disease that its characteristic symptoms require a special notice. The rash comes out late and imperfectly, and sometimes is hardly perceptible. After having appeared, it may suddenly recede; sometimes it is intermixed with livid spots. It

pulse is feeble, the skin is cold, and there is extreme prostration of strength. In such a case as this, death may occur (apparently from blood-poisoning) in a few hours. Other cases rapidly assume a typhus-like character. 'The pulse (says Dr Watson) becomes frequent and feeble; the tongue dry, brown, and tremulous; the debility extreme; the breath offensive; the throat is livid, swollen, ulcerated, and gangrenous; and the respiration is impeded by viscid mucus, which collects about the fauces. Over this variety of the disease, medicine has comparatively little control.'

Even in *S. anginosa*, there is very considerable danger. The disease may prove fatal (1) from inflammation or effusion within the head, or (2) from the throat-affection, which too often proceeds to laryngisation and sloughing of the adjacent parts. Moreover, in parturient women, even the mildest form of the disease is fraught with the greatest peril. Further, when the disease is apparently cured, the patient is exposed to great hazard from its consequences or *sequelæ*. Children who have suffered a severe attack of scarlet fever are liable (in the words of the eminent physician to whom we have already referred) 'to fall into a state of permanent bad health, and to become a prey to some of the many chronic forms of scrofula—boils, tumorous ulcers, diseases of the scalp, sores behind the ear, scrofulous swellings of the cervical glands of the upper lip, chronic inflammation of the eyes and eyelids. The above-named consequences of unfrequently follow small-pox and measles, but, in addition to these, scarlatina is often followed by the form of dropsy known as *anasarca*, or serous infiltration of the subcutaneous cellular tissue, frequently accompanied with dropsy of the larger serous cavities. Strange as it may at first sight appear, this dropsy is much more common after a mild than after a severe form of the disease; but this apparent anomaly is probably due to the fact, that less caution is observed in the former than in the latter cases during the dangerous period of desquamation. If the patient (for example) is allowed to go out while new cuticle is still forming, the perspiratory power of the skin is checked by the cold, and the escape of the fever poison through the great cutaneous outlet is thus prevented. An excess of the poison is therefore driven to the kidneys, where it gives rise to the form of renal disease known as 'acute desquamative nephritis.'

Scarlatina is a disease that—like all the exanthemata—occurs in the epidemic form; and each epidemic presents its peculiar type, the disease being sometimes uniformly mild, and in others almost as uniformly severe. The treatment of this disease varies according to the preponderating symptoms. In *S. simplex*, nothing is required except confinement to the house, a non-stimulating diet, and the due regulation of the bowels, which are apt to be constive. In *S. anginosa*, cold or tepid sponging gives much relief if the skin is hot. If there is much fever, and especially if delirium supervene, a few leeches should be applied behind the ears, or if the patient were previously in robust health, blood might be cautiously taken from the arm. If, however, no bad head-symptoms are present, all that is necessary is to prescribe saline draughts, of which citrate of ammonia, with a slight excess of carbonate of ammonia, forms the best ingredient, and to keep the bowels open once or twice a day by gentle laxatives. In *S. maligna*, there are two main sources of danger, which were first recognised as distinct by Dr Watson, who describes them as follows: 'The one arises from the primary impression of the contagious poison upon the body, and

particularly upon the nervous system, which is overwhelmed by its influence. The patients sink often at a very early period, with but little affection either of the throat or skin. If we can save such patients at all, it must be by the liberal administration of wine and bark, to sustain the flagging powers until the deadly agency of the poison has in some measure passed away. But another source of danger arises from the gangrenous ulceration which is apt to ensue in the fauces, when the patient is not killed by the first violence of the contagion. The system is re-inoculated, I believe, with the poisonous matter from the throat. Now, under these circumstances also, quinia, or wine, and upon the whole, I should give the preference to wine, is to be diligently though watchfully given.' In addition to these remedies, a weak solution of chloride of soda, of nitrate of silver, or of Condy's disinfectant fluid, should be used as a gargle; or if, as is too often the case, the patient is incapable of gargling, the solution may be injected into the nostrils and against the fauces by means of a syringe or elastic bottle.

Three medicines have been so highly commended in scarlet fever generally, by trustworthy observers, that it is expedient to notice them. The first is chlorate of potash (KClO_3) dissolved in water in the proportion of a drachm to a pint. A pint, or a pint and a half, may be taken daily. It was originally prescribed under the idea that it gave off its oxygen to the blood, and was eliminated from the system as chloride of potassium (KCl). Although this view is now known to be incorrect, there is no doubt that the salt is often prescribed with great benefit in this and some other diseases, as, for example, diphtheria and typhus fever. The second medicine is a very weak, watery solution of chlorine, of which a pint may be taken in the day; and the third is carbonate of ammonia in five-grain doses three times a day, given in beef-tea, wine, &c.

In the early stage, before the appearance of the rash, scarlatina may be readily mistaken for several other febrile diseases; after the appearance of the rash, the only disease for which it can be mistaken is measles, and we must refer to the article on that disease for a notice of the distinctive characters of the two affections.

There is no complaint in which the final result is more uncertain than this, and the physician should give a very guarded opinion as to how any special case may terminate.

Whether the disease is contagious throughout its course, or only at one particular period, is unknown; and if the physician is asked at what period the danger of imparting the disease on the one hand, or catching it on the other, is over, he should candidly declare that he does not know. That the contagion remains attached to furniture, clothing, &c., for a long period is undoubted. Dr Watson gives a remarkable instance of a small piece of infected flannel communicating the disease after the interval of a year.

The popular delusion that *scarlatina* is a mild and diminutive form of *scarlet fever* should always be corrected, as the error, if uncorrected, may do much harm by leading to a disregard of those precautions which are always necessary in this disease.

SCARLATTI, ALESSANDRO, a musician of great eminence, born at Trapani in Sicily in 1659. He is said to have studied under Carissimi; if so, it must have been when very young. In 1680, S. visited Rome, and composed his first opera, *L'onesta nell'amore*, first performed at the court of Queen Christina of Sweden. His opera, *Pompeo*, was performed at Naples in 1684. In 1693, he composed the oratorio, *I Dolori di Maria sempre Vergine*, and

the opera *Teodora*, in which orchestral accompaniments were first introduced to the recitatives, and a separate design given to the accompaniments to the airs. In the following eight years, during part of which time he held the office of *maestro di capella* at Naples, he produced various operas, the most remarkable being *Lodovica e Berenice*, composed in 1701. Between 1703—1709 he held the situation of *maestro di capella* at St Maria Maggiore at Rome; he then returned to Naples; and in 1715, produced *Il Tigrane*. Alessandro S. died in 1721. His musical works comprise 117 operas, several oratorios, and a great deal of church music, besides various madrigals and other chamber music. He was the founder of the Neapolitan school, in which were trained most of the great musicians of last century, and whose influence can be traced in the works of almost every composer who has flourished since. His invention was rich and bold, his learning great, and his style pure. His modulations, often unexpected, are never harsh, and never difficult for the voice.—His son, DOMENICO (born 1685, died 1757), was the first harpsichord player of his day. Among his compositions are a number of sonatas, remarkable for invention, graceful melody, and skilful construction.—Domenico S. had a son, GIUSEPPE (born 1718, died 1796), who was also known as an eminent musician.

SCARLET COLOURS. Cochineal furnishes the only scarlet colour generally employed in dyeing, and for this purpose it is very extensively used; a solution of tin and cream of tartar is employed as the mordant to fix it. Scheffer, who produced the best formula for dyeing this colour, also added starch, the proportions being as follow: Starch, 9 lbs.; cream of tartar, 9 lbs. 6 oz.; solution of tin, 9 lbs. 6 oz.; and cochineal, 12 lbs. 4 oz. These are the quantities required for 100 lbs. of wool or cloth.

SCARP. See ESCARP.

SCARPA, ANTONIO, a celebrated anatomist, was born on 13th June 1747, at Castello-Motta, a village in the Friuli. He was educated at Padua, where his ardour attracted the attention of the octogenarian Morgagni, who, having lost his sight shortly after the arrival of S. at the university, engaged the young enthusiast as his secretary, and dictated to him in Latin the answers which he made to letters soliciting his advice. The intervals between their medical studies were employed by Morgagni and S. in the perusal of the Latin authors, and it is to this practice that we must ascribe the elegance that distinguished the scientific style of S. in his subsequent publications. In 1772, he was appointed Professor of Anatomy in Modena. He afterwards visited France, Holland, and England; and while in London, was so enamoured of John Hunter's Museum, that he did not rest until he had constructed a similar one at home. In 1783, he filled the anatomical chair at Pavia. He made, in the following year, a journey throughout the greater part of Germany, and in the course of it acquired the experience that made him one of the greatest clinical surgeons in Europe. On his return to Pavia, he published in rapid succession treatises on the anatomy of the Organs of Smell and Hearing; on the Nerves of the Heart, and on the minute anatomy of Bone. These, especially that on the innervation of the heart, which settled the question whether that viscus was supplied with nerves, gave S. a European reputation. His work on the Diseases of the Eye, published in 1801, was followed in 1804 by his observations on the Cure of Aneurism. But his greatest achievement was his work on Hernia, published in 1809. His reputation

was now at its highest; but three years afterwards he had to give up the work of public teaching, and entered, in 1814, on the office of Director of the Medical Faculty of Pavia. His next publication was some valuable observations on the operation for Stone. For the last years of his life, he suffered from almost total blindness, until, on the 30th October 1832, he died at Pavia, of inflammation of the bladder. S.'s merits as an observer, a teacher, and a writer were very great. Industrious, scholarly, artistic, he appeared to great advantage in nearly every subject he undertook.

SCARPANTO (anc. *Carpathos*), an island in the Mediterranean, belonging to Turkey, midway between the islands of Rhodes and Crete. It is 15 miles long, and about 8 miles in extreme breadth, and its surface is covered with bare mountains which reach the height of 4000 feet. The ruins of towns, which are found in several places, seem to indicate that formerly the island was well peopled. At present, the inhabitants are only about 500 in number, and are mostly employed as carpenters and workers in wood, a trade of which they seem peculiarly fond, and in commerce.

SCARPE, in Heraldry, a diminutive of the bezel, being half the breadth of that ordinary.

SCARRON, PAUL, the creator of French burlesque, was born at Paris in 1610. His father, a counsellor of parliament, was a man of force and good family; but he having married again after the death of Paul's mother, discord broke out between the second wife and her step-children, the result of which was that Paul had to leave the house. About 1634, he visited Italy, where he made the acquaintance of Poussin the painter. On his return to Paris, he delivered himself over to a life of very gross pleasure, the consequence of which was that, in less than four years, he was seized with permanent paralysis of the limbs. What made this incident in his career still interesting is the fact, that it undoubtedly exercised no inconsiderable influence on the development of his peculiar genius, which, as a French critic justly says, was 'the image of his body.' His love of burlesque, malicious buffoonery, of profane gaiety, was in a way of escape through the gates of mortality from the *tourmens vehemens* of his incurable ailment. His scramble for the means of living is extreme when we consider his hapless infirmity. He wrote verses, flattering dedications, begging-letters, pensions, &c.; and in 1643 he even managed to get a benefice at Mans, which he held for three years when he returned to Paris, and lived in a very elegant Bohemian style. He had a pension from Mazarin of 500 crowns; but when the cardinal declined (probably from avarice) to allow *Typhon* to be dedicated to him, S. got extremely indignant, and joining the Frondeurs, lampooned Mazarin with spleenful virulence. However, with the war of the Fronde was at an end, and Mazarin had triumphed, S. was ready with an ode to

Jule, autrefois l'objet de l'injuste satire.

This baseness, however, did not win him back his pension, which the 'object of his unjust satire' had withdrawn; and it might have fared hard with the poet, had other friends not started up—for example, Fouquet, who granted him a pension of 1600 crowns—and had he himself not been the most summatte beggar that ever lived. If he could not get a benefice or a purse of gold, or a huge court, he would take a load of firewood or a carriage, pasties, capon, cheese, poodles, &c.—nothing came amiss; and his ample acknowledgments shewed how thoroughly he had mastered

SCATTERY ISLAND—SCHADOW.

the art of expressing gratitude. Doubtless his physical helplessness induced this bad habit, but his importunities were so pleasantly worded that they never estranged the friends on whom he fastened. In 1652, S. married Françoise d'Aubigné—a girl of 17, who subsequently became the mistress of Louis XIV., and is known as Madame Maintenon (q. v.). He died early in October 1660—the exact date is not known, but he was buried on the 7th. It is a proof of the charm of his company that his rooms were frequented by most of the men and women of his day who were distinguished either in literature or society. Among his works may be mentioned *Le Typhon*, *Virgile Travesti* (Par. 1648—1652), *La Mazarinade* (1649), *La Baronnade Léandre et Héro*, *Ode Burlesque*, *La Relation du Combat des Purques et des Poëtes sur la Mort de Voiture*, *Poésies Diverses* (Par. 1643—1651), comprising sonnets, madrigals, epistles, satires, odes, &c.; *Le Roman Comique* (Par. 1651), a most amusing account of the life led by a company of trolling players—it is the best known, and perhaps the best of all S.'s productions; *Nouvelles Tragiques*, from one of which (*Les Hypocrites*) Voltaire has taken the idea of *Tartuffe*; besides a number of clever but coarse comedies. The editions of his works are very numerous, but the best is that of Bruzen de la Martinière (Amster., 10 vols., 1737; 7 vols. 1786). Victor Fournel, to whom we are indebted for most of the information in this article, republished *Le Roman Comique*, in 1857, and *Le Virgile Travesti* in 1858.

SCATTERY ISLAND, a small islet in the strait of the Shannon, three miles south-west of the town of Kilrush. Besides a fort, the islet contains fragments of several small churches, and an ancient round tower 120 feet high.

SCAUP DUCK (*Fuligula*—or *Nyroca*—*marila*), a oceanic species of duck, of the same genus with the pochard (q. v.), an inhabitant of the northern parts of the world, spending the summer in arctic or subarctic regions, and visiting the coasts of Britain and of continental Europe as far south as the Mediterranean in winter, when it is also to be seen in great flocks in the United States, not only on the

Scap Duck (*Fuligula marila*).

a coast, but on the Ohio, Mississippi, and other rivers. It breeds in fresh-water swamps. It is nearly equal in size to the Pochard. The male has a red beak, neck, and upper part of the breast and neck black, the cheeks and sides of the neck glossed with rich green; the back white, spotted and rippled with black lines; the wing-coverts darker than the back, the speculum white; the rump and tail-coverts black. The female has brown instead of black, and old females have a broad white band round the base of the bill. The flesh of the duck is tough, and has a strong fishy flavour.

SCHEATTÆ. See NUMISMATICS.

SCENA. See THEATRE.

SCEPTICISM (Gr. *skeptomai*, 'I consider') strictly denotes that condition in which the mind is before it has arrived at conclusive opinions—when it is still in the act of reflecting, examining, or pondering over subjects of thought. Scepticism is therefore the opposite of dogmatism (see DOGMA). The notion of 'disbelief,' is quite a secondary meaning of the term. Among the Greeks a *skeptikos*, 'sceptic,' was originally only a thoughtful person, and the verb *skeptomai*, never acquired any other signification than 'to consider.' But inasmuch as the mass of men rush to conclusions with haste, and assert them with far more positiveness than their knowledge warrants, the discerning few of clearer vision or cooler head, are often brought into collision with popular beliefs—more especially in religion, the sphere in which popular beliefs are most numerous, most positive, and most inconsiderate—and are compelled by the violent shock given to their reason to 'doubt,' it may be to 'disbelieve' what they hear affirmed by the multitude with indefensible emphasis of speech. Thus it is that in common parlance a sceptic has come to mean an infidel, and scepticism infidelity. But the field of thought in which scepticism properly so-called has preferred to exercise itself is not religion but philosophy. Philosophical sceptics in all ages and countries have generally denied or at least doubted the trustworthiness of the senses as vehicles of absolute truth, and so have destroyed the very possibility of speculation. In ancient times, Pyrrhon (q. v.), in modern, David Hume (q. v.), are the most characteristic representatives of this kind of scepticism.

SCEPTRE (Gr. *skēptron*, staff; from *skēpto*, to send or thrust), originally a staff or walking-stick, hence in course of time, also a weapon of assault and of defence. At a very early period the privilege of carrying it came to be connected with the idea of authority and station. Both in the Old Testament and in Homer, the most solemn oaths are sworn by the sceptre, and Homer speaks of the sceptre as an attribute of kings, princes, and leaders of tribes. According to Homer, the sceptre descended from father to son, and might be committed to any one to denote the transfer of authority. Among the Persians, whole classes of persons vested with authority, including eunuchs, were distinguished as the 'sceptre-bearing classes.' The sceptre was in very early times a truncheon pierced with gold or silver studs. Ovid speaks of it as enriched with gems, and made of precious metals or ivory. The sceptre of the kings of Rome, which was afterwards borne by the consuls, was of ivory, and surmounted by an eagle. While no other emblem of sovereignty is of the same antiquity as the sceptre, it has kept its place as a symbol of royal authority through the middle ages and down to the present time. There has been considerable variety in its form; the sceptre of the kings of France of the first race was a gold rod as tall as the king himself.

SCHADOW, GODENHAUS FRIEDR. WILH. VON, a distinguished German painter, of the Düsseldorf school, was born at Berlin, September 6, 1789. His father, Joh. Gottf. S., an eminent sculptor, died director of the Berlin Academy of Arts, in 1850. At first young S. did not give much promise of excellence, but during his first visit to Rome, the influence of Overbeck, Cornelius, Führich, Veit, &c., awoke his dormant genius, and both singly and in company with some of these artists, he executed several pictures remarkable for their

depth of religious sentiment; as 'An Explanation of the Dream of Joseph' and 'The Grief of Jacob when told of the Death of his Son.' While residing in the city of the pope, he passed over to Roman Catholicism. Scarcely had S. returned to Berlin when he was appointed professor of the academy, and soon gathered round him a host of brilliant pupils; but in 1826 he went to Düsseldorf as successor of Cornelius, in the direction of the notable academy there. His pupils followed him, and ever since the 'Düsseldorf School' has been associated specially with their names. S.'s principal works are 'Mignon' (1828); 'The Four Evangelists,' 'The Wise and Foolish Virgins,' 'The Source of Life,' 'The Assumption,' and 'Heaven,' 'Purgatory,' and 'Hell.' S. was ennobled in 1843. *Der Moderne Vasari* (1854) is a book from his hand. He died 19th March 1862.

SCHAFFHAUSEN, the most northern canton of Switzerland, is bounded on all sides but the south by the duchy of Baden. Area, 116 sq. m.; pop. (1870) 37,721, of whom about 34,500 are Protestants, and 3050 are Catholics. The chief river is the Rhine, which forms part of the southern boundary, and within the basin of which the canton is wholly included. The surface is hilly, especially in the north and east, and of the many rich valleys that slope southward to the Rhine, that of the Klettgau is famous for its unusual fertility, and for its wines, the bouquet of which is peculiarly fine. The climate is mild; the soil, which is mostly calcareous, is generally fruitful, and agriculture is the principal branch of industry. Grain, fruits, flax, hemp, and wine are the chief crops. Iron is obtained. The sovereignty is usually exercised by the great council of 600 members, wholly renewed by ballot every 4 years; but the people have the right of veto. S. sends 2 members to the National Council.

SCHAFFHAUSEN, a town of Switzerland, capital of the canton of the same name, beautifully situated on the right bank of the Rhine, immediately above the celebrated falls of that river. Higher up the slope on which the town stands, is the curious castle of Munoth, and this edifice and the minster, founded in 1052, are the chief buildings. The town is remarkable for the antique architecture of its houses. The old wall and gateways of S. are also very picturesque. Pop. 10,300, who are partly engaged in the manufacture of iron, cotton, and silk goods. The *Falls of Schaffhausen*, about three miles below the town, form, perhaps, the most imposing spectacle of the kind in Europe. The river is here 300 feet broad, and the entire descent is about 100 feet. From a projecting balcony which overhangs the roaring cataract, the visitor may appreciate the full grandeur of the fall.

SCHALL, JOHANN ADAM VON, a celebrated Jesuit missionary to China, was born of noble family at Cologne in 1591, and having made his studies and entered the Jesuit order in Rome, in 1611, he was selected, partly in consequence of his great knowledge of mathematics and astronomy, to form one of the mission to China in 1620. Having, with the characteristic skill and ability of his order, turned to good account among the Chinese his familiarity with mathematical and mechanical science, he not only succeeded in forming a flourishing mission, but was ultimately invited to the imperial court at Peking, where he was entrusted with the compilation of the calendar, and the direction of the public mathematical school, being himself created a mandarin. Such was his favour with the emperor, that, contrary to all the received etiquette, he had the privilege of free access to the presence of the Emperor Chun-Tche, the founder of the Tartar

dynasty (1645), and was honoured by visits from the emperor at four stated times in each year. Through this favour with the emperor, S. obtained an edict which authorised the building of Catholic churches, and the liberty of preaching throughout the empire; and in the space of 14 years 2 Jesuit missionaries in the several provinces are said to have received into the church 100,000 proselytes. On the death of this emperor, however, a change of policy fatal to the prospects of Christianity took place. The favourable edict above referred to was revoked; S. was thrown into prison and sentenced to death. He was afterwards liberated; but he was again imprisoned, and, at the end of a long incarceration, died August 15, 1669. He had acquired a perfect mastery of the Chinese language, in which he compiled numerous treatises upon scientific and religious subjects. A large MS. collection of his remains in Chinese, amounting to 14 volumes in all, is preserved in the Vatican Library. He also translated into Chinese several works, doctrinal and medical, especially some treatises of Father Lessa, a Flemish Jesuit, the most important of which is that *On the Providence of God*.—See *Ma. Histoire Générale de la Chine* and *Huc's Christianisme en Chine*.

SCHÄS'BURG, or **SCHÄSSBURG** (Magyar *Szeged*), a town of Austria, in Transylvania, on the great Kokel. It consists of the Burg or Upper Town and the Lower Town. Pop. 8204.

SCHAUMBURG-LIPPE, a sovereign German principality, includes the western part of the former county of Schaumburg, and is bounded on the N. by Westphalia, and the N. by Hanover. Area, 117 sq. m.; pop. (1871) 32,059. It shares the physical characters of the surrounding states. Till 1807 its constitution was on the ancient patriarchal basis, but since, the S.-L. has a representative diet of 15 members, 10 of whom are elected by the towns and the country districts, the rest by the nobility, and the clergy and educated classes. The administration of jurisprudence and of police affairs is still exercised by the same authority. The line of S.-L., a branch of the House of L. (q. v.), split off from the main stem in the year 1613.

SCHEELE, CHARLES-WILLIAM, an eminent Swedish chemist, was born at Stralsund, 1742, after receiving a brief and incomplete education was apprenticed to an apothecary at Gothenburg, where he laid the foundation of his knowledge of chemistry. In 1767, he settled at Stockholm as an apothecary; and in 1770, removed to Uppsala, where at that time the celebrated Bergmann was professor of chemistry. It was during his residence at Uppsala that he carried on those investigations in chemical analysis which proved so fruitful of important and brilliant discoveries, and for which their author by the side of Linnæus and Berzelius his countrymen—in the front rank of science. In 1777, he removed to Köping to take possession of a vacant apothecary business, but died of ague on 24th May 1786, at a time when he was receiving the most tempting offers from England to persuade him to settle in that country. The chief of his discoveries were tartaric acid (1770), chlorine (1774), baryta (1774), oxygen (1777), and glycerine (1777), the second-last of which had been previously known through the labours of Priestley, though he was not aware of this till after his own discovery of it in 1777. In experimenting on arsenic acid, he discovered the arsenite of copper, which is known as a pigment under the name of *Mineral Green* or *Mineral Green*. In 1782, during an extremely delicate and subtle investigation to determine

SCHEELE'S GREEN—SCHELLING.

the nature of the colouring-matter in Prussian Blue, succeeded in obtaining, for the first time, prussian blue in a separate form. The mode and results of various investigations were communicated from time to time, in the form of memoirs, to the Academy of Stockholm, of which he was an associate, and so in his chief work, the *Chemical Treatise on Iron and Fire* (1777), and in an *Essay on the Colouring Matter in Prussian Blue* (1782). S. died in 1786. SCHEELE'S GREEN. See ARSENIOUS ACID.

SCHEFFER, ARY, a French painter, born at Rotterdam, in Holland, 10th February 1795, studied at the Guérin of Paris, and made his début as an artist in 1812. Some years later appeared his *Portrait of Saint-Louis*, 'Le Dévouement des Bourgeois de Calais,' and several *genre* pieces, such as *La Veuve du Soldat*, 'Le Retour du Conscrit,' *La Sœur de Charité*, 'La Scène d'Invasion,' &c., which have been popularised in France by engravings; but compared with his later performances, these early pictures have little merit. It was not till the 'Romantic' movement reached art that S. began to feel conscious of his peculiar power. The influence of Goethe and Byron became conspicuous in his choice of subjects, and to the remarkable facility of execution that had always marked him, he now added a subtlety and grace of imagination, that gave an inexpressible charm to his works. The public admired his new style greatly, and lavished eulogy on his liberal hand on his 'Marguerite à son Rouet,' 'Le tourmenté par le Doute,' 'Marguerite à l'Eglise,' 'Marguerite au Sabbat,' 'Marguerite sortant de l'Eglise,' 'Marguerite au Jardin,' 'Marguerite à la Fontaine,' 'Les Mignons,' 'Le Larmoyeur,' 'Francesca de Rimini,' &c. Towards the year 1836, his art underwent its third and final phase—the religious. To this class belong his 'Le Christ Consolateur,' 'Le Christ Rémunérateur,' 'Les Bergers conduits par l'Ange,' 'Les Rois Mages déposant au Trésor,' 'Le Christ au Jardin des Oliviers,' 'Le Christ portant sa Croix,' 'Le Christ enseveli,' 'Saint Augustin et sa Mère Sainte Monique,' one of which are well known in England by engravings. S. also executed some remarkable portraits; among others, those of La Fayette, Béranger, Lamartine. He died at Argenteuil, near Paris, 15th June 1858.

SCHELDT, THE (pron. *Skelt*; Lat. *Scaldia*, *l'Escaut*), rises in the French dep. of Aisne, flows northerly to Cambrai, Valenciennes, Bouchain, Condé, when entering Belgium, it passes Doornik, Menarde, Ghent, Dendermonde, Rupelmonde, and Antwerp, having received, among other tributaries, the Lys, Dender, and Rupel. Navigable from its entrance into Belgium, the S. at Antwerp becomes a noble river, of sufficient depth for large ships. From Antwerp, the course is north-west, to Fort Mith, in the Netherlands, where, coming in contact with the island of South Beveland, it divides into two arms. The left or southern, called the Honte or Wester S., takes a westerly direction, south of the islands of Zeeland, and meets the North Sea at IJshing; the northern or right arm, called the Rekerak, flows between Zeeland and North Brabant, near Bergen-op-zoom, dividing again into two branches, the left, called the Easter S., passing between the islands of Tholen and Schouwen on the right, and the Bevelands on the left, reaches the sea through the Roompot (*Romanorum portus*); the other branch, flowing between North Brabant and Zeeland, discharges itself by several passages. These several mouths of the S., forming various islands, are called the Zeeland streams.

The Dutch had long monopolised the navigation of the lower S.; and by the treaty signed in London

(April 19, 1839), the Netherlands secured the right of levying 2s. 6d. per ton on all vessels. By a treaty signed at Brussels, July 16, 1863, this toll has been bought up, nominally by Belgium, but in reality from a sum of £750,000 paid to that country by the powers whose ships navigate the S., the proportion falling to Great Britain being fully £350,000.

SCHE'LENNBERG, a village in the south-east of Upper Bavaria, six miles south-west of the Austrian town of Salzburg, near which occurred the first battle of the 'War of the Spanish Succession,' in which the English took part. Maximilian-Emmanuel, elector of Bavaria, had fortified the hill of S. to resist the progress of Marlborough; but on July 4th, 1704, the work was attacked by the English, led on by Prince Ludwig of Baden, and carried by storm after a bloody fight.

SCHELLING, FRIEDR. WILH. JOS. VON, an illustrious German philosopher, was born at Leonberg, in Würtemberg, January 27, 1775, studied at Tübingen and Leipzig, and in 1798 proceeded to Jena, then the headquarters of speculative activity in Germany, through the influence of Reinhold and Fichte. S.'s philosophical tendencies were originally determined by Fichte; in fact, he was at first only an expounder, though an eloquent and independent one, of the Fichtian idealism, as one may see from his earliest speculative writings, *Über die Möglichkeit einer Form der Philosophie* (On the possibility of a Form of Philosophy, Tüb. 1795), *Vom Ich als Princip der Philosophie* (Of the Ego as the Principle of Philosophy, Tüb. 1795), and others. Gradually, however, S. diverged from his teacher, and commenced what is regarded as the second phase of his philosophy. Fichte's idealism now seemed to him one-sided and imperfect through its rigorous and exclusive subjectivity, and he sought to harmonise and complete it. The result of his speculations, in this direction, was the once famous *Identitätsphilosophie* (Philosophy of Identity), which claimed to shew that the only true knowledge, and, therefore, the only philosophy, was that of the Infinite-absolute, in which the 'real' and 'ideal,' 'nature' and 'spirit,' 'subject' and 'object,' are recognised as absolutely the same; and which affirmed the possibility of our attaining to such knowledge by a mysterious process, known as 'Intellectual Intuition.' The 'philosophy of identity,' though only the second stage in S.'s speculative career, is the most important, and is the one by which he is best known in England—Sir William Hamilton having elaborately discussed it, and endeavoured to demonstrate its untenableness in his essay on the 'Philosophy of the Conditioned' (see *Discussions in Philosophy and Literature, Education and University Reform*, 1852). The principal works in which it is more or less completely developed, are *Ideen zu einer Philosophie der Natur* (Ideas towards a Philosophy of Nature, Leips. 1797, 2d ed. 1803); *Von der Weltseele, eine Hypothese der Höheren Physik zur Erläuterung des allgemeinen Organismus* (Of the World-soul, an Hypothesis of the higher Physics in elucidation of the Universal Organism, Hamb. 1798, 3d ed. 1800); *Erste Entwurf eines Systems der Naturphilosophie* (First Attempt at a Systematic Philosophy of Nature, Jena, 1799); and *System des Transcendentalen Idealismus* (System of Transcendental Idealism, Tüb. 1800). In 1803, after the departure of Fichte from Jena, S. was appointed to succeed him, but in the following year went to Würzburg, whence, in 1808, he was called to Munich as secretary to the Academy of Arts, and was ennobled by King Maximilian-Joseph. Here he lived for 33

start and jump about as if alive, discharging jets of this peculiar fluid. The same phenomenon is exhibited by the leaves of some species of the kindred genus *Durania*, of which specimens are occasionally to be seen in our greenhouses. The leaves and twigs when bruised have a very strong odour of turpentine.

SCHISM, GREEK, the separation between the Greek and Latin churches, which originated in the 9th, and was completed in the 12th century. See GREEK CHURCH.

SCHISM, WESTERN, a celebrated disruption of communion in the Western Church, which arose out of a disputed claim to the succession to the papal throne. On the death of Gregory XI. in 1378, a Neapolitan, Bartolomeo Prignano, was chosen pope by the majority of the cardinals in a conclave at Rome under the name Urban VI. Soon afterwards, however, a number of these cardinals withdrew, revoked the election, which they declared not to have been free, owing to the violence of the factions in Rome by which the conclave had, according to them, been overawed; and, in consequence, they proceeded to choose another pope under the name Clement VII. The latter fixed his see at Avignon, while Urban VI. lived at Rome. Each party had its adherents, and in each a rival succession was maintained down to the council of Pisa in 1410, in which assembly both were deposed, and a third pope, John XXIII., was elected. This measure not having been acquiesced in by all, a new council was convened at Constance in 1417, in which not alone the former rivals, but even the new pontiff elected, by consent of the two parties, at Pisa, were set aside, and Otho Colonna was elected under the name of Martin V. In this election the whole body may be said to have acquiesced; but one of the claimants, Peter de Luna, called Benedict XIII., remained obstinate in the assertion of his right till his death in 1430. The schism, however, may be said to have terminated in 1417, having thus endured nearly 40 years.

SCHISMATA, the name given to one of the very small intervals known in the theory of music, which amounts to the difference between the *Comma ditonicum* and *Comma syntonicum*. See COMMA.

SCHIST (Gr. *schistos*, split) is a term applied somewhat loosely to indurated clays, as bituminous schist and mica schist. It is more correctly confined to the metamorphic strata, which consist of plates of different minerals, as mica schist, made up of layers of quartz separated by laminae of mica; chlorite schist, a green rock in which the layers of chlorite are separated by plates of granite or felspar; and hornblende schist, a black rock composed of layers of hornblende and felspar, with a little quartz.

SCHLA'NGENBAD, one of the most distinguished spas of Germany, on the northern frontier of the Rheingau district, 6 miles west of Wiesbaden, in a beautiful and secluded situation, embosomed amid wooded hills. The water of the baths has a temperature of 80° F., and contains the muriates and carbonates of lime, soda, and magnesia, with a slight excess of carbonic acid. The baths have a marvellous effect in beautifying the skin, and in soothing and tranquillising. The village is itself very small, and in the height of the season the pop. is only about 1000.

SCHLEGEL, AUGUST WILHELM VON, a distinguished critic, poet, and scholar, was born at Hanover, 8th September 1767, and studied at Göttingen, where he acquired a reputation by his devotion to philological and classical studies. He

first began to assume a prominent position in literature, while a lecturer at Jena, contributing assiduously to Schiller's *Horca* and *Mar- Almanach*, and to the *Allgemeine Literaturzeitung*. About the same time, his translation of *Saunders* began to appear (9 vols. Berl. 1797—1800), the influence of which on German poetry and the German stage was equally great. Subsequently, the poet Tieck, with S.'s consent, undertook a revision of the work, together with a translation of such pieces as S. had omitted (12 vols. Berl. 1825, 1839, 1843); and from these conjoint labours, the people of Germany are able to form a faithful idea of the surpassing genius of the countryman. S. also delivered at Jena a series of lectures on aesthetics, and along with his brother Friedrich, edited the *Athenaeum* (3 vols. Berl. 1798—1800), which in spite of, perhaps because of, the severity of its criticism, gave a lively and wholesome impulse to the poetry of its time. He published, besides, his first volume of poems (Götting. Tüb. 1800); and, again in company with his brother, the *Charakteristiken und Kritiken* (2 vols. Königsb. 1801). In 1802, S. left Jena for Berlin, where he gave a second series of lectures on literature, art, and the spirit of the time. Next appeared his *Ion*, an antique tragedy of considerable merit. It was followed by his *Spanische Tragedien* (2 vols. Berlin, 1803—1809), consisting of pieces of Calderon's, admirably translated, some of which has been to make that poet quite a favourite with the German people; and his *Strassee der Ital., Span., und Portug. Poeten* (1804), a charming collection of lyrics from the sunny south, from the appearance of which the naturalisation in German verse of the metric forms of the Romanic races. Probably his most valuable, and certainly his most widely popular work, was his *Vorlesungen über dramatische Kunst und Literatur* (3 vols. Heidelb. 1809—1811), originally delivered at Vienna, in the spring of 1808, and translated into most European languages. During 1811—1815, S. published a new edition of his poems (*Poetische Werke*), which contained masterpieces, 'Arion,' 'Pygmalion,' 'St. Lucia,' &c. is notable for the richness and variety of its forms, as also for the singular facility and elegance of the versification. In 1818, S., now raised to the ranks of the nobility, and privileged to use the sacred *von* before his name, was appointed Professor of History in the university of Bonn, and devoted himself especially to the history of the fine arts and to philological research. He was one of the first students of Sanskrit in Germany, established a Sanscrit printing-office at Bonn, and an *Indische Bibliothek* (2 vols. Bonn, 1820—1826). Among the proofs of his activity in this department of knowledge, he mentioned his edition of the *Bhagavad Gita*, an episode from the epic poem, *Mahabharata*, in Latin translation (2d ed. Bonn, 1846), and his of the *Râmâyana* (Bonn, 1829—1839). His works it is unnecessary to mention. S. was happy in his domestic relations. He was married, first to a daughter of Professor Müller of Göttingen, and again to a daughter of Professor Paulus of Heidelberg, but in both cases a separation soon became necessary. S. was quarrelsome, jealous, and ungenerous in his relations with literary men, and did not even shrink from attacking them when his spleen was excited. He died at Bonn, 12th March 1845.

SCHLEGEL, KARL WILHELM FRIEDRICH, a distinguished both for his scholarship and intellectual ability, was a brother of the preceding. He was born at Hanover, 10th March 1772. He

studied at Göttingen and Leipzig, and in 1797, published his first work, *Griechen und Römer* (The Greeks and Romans), which won praise from old Heyne. It was followed in the course of a year by his *Geschichte der Poesie der Griechen und Römer* (History of Greek and Roman Poetry), a sort of fragmentary continuation of the former. Both of these productions bore evidence of rich learning, independent thought, and a thorough appreciation of the principles and method of historic criticism; but the chief vehicle at this time for the dissemination of his philosophical views of literature was the harp-tongued periodical called the *Athenaeum*, edited by himself and his brother, August Wilhelm. Proceeding to Jena, he started there as a *privat-docent*, holding lectures on philosophy, which met with great applause, and still editing the *Athenaeum*, to which he also began to contribute poems of a superior quality, and in the most diverse metres. In 1802, appeared his *Alarkos*, a tragedy, in which the antique-classical and new-romantic elements are singularly blended. From Jena, he soon went to Dresden, and thence to Paris, where he gave a few more of those philosophical prelections, in the manufacture of which both he and August Wilhelm were unhappily much too expert; edited the *Europa*, a monthly journal (2 vols. Frankf. 1803—1805); and applied himself assiduously to the languages of Southern Europe, and still more assiduously to Sanscrit, the fruits of which were seen in his treatise, *Ueber die Sprache und Weisheit der Indier* (Heidelb. 1808). See PHILOLOGY. During his residence in Paris, he also published a *Sammlung Romantischer Dichtungen des Mittelalters* (Collection of Medieval Romantic Poems, 2 vols. Par. 1804), and the pious-bivalric romance of *Lothar und Maller* (Berl. 1805). On his return to Germany, he published a volume of iambic and elegiac poems (*Geistliche*, Berl. 1809). At Cologne, he passed over to the Roman Catholic Church, a change to which his medieval studies powerfully contributed, and which, in its turn, no less powerfully affected his future literary career. In 1808, S. went to Vienna, where, in 1811, appeared his *Ueber die neuere Geschichte* (Lectures on Modern History), and in 1815, his *Geschichte der alten und neuen Literatur* (History of Ancient and Modern Literature). In 1822, a collected edition of his writings, in 12 vols. (*Sämmtliche Werke*), was published by himself. Subsequently, he delivered two series of lectures, one on the Philosophy of Life (*Philosophie des Lebens*, Vienna, 1824), and another on the Philosophy of History (*Philosophie der Geschichte*, Vienna, 1829), both of which are well known in England and other countries through the medium of translations. S. died 12th January 1829. His MSS. were published by his friend Windischmann (2 vols. Bonn, 1836—1837).

SCHLEIERMACHER, FRIEDRICH ERNST DANIEL, one of the greatest and most influential theologians of modern times, was born at Breslau, 11st November 1768. His boyish years were spent in the school kept by the Moravian brotherhood at Niesky, and here he first received those religious impressions the influence of which was visible in his whole after-life. In 1787, he proceeded to the university of Halle; and on the conclusion of his academic course, acted for some time as a teacher; but in 1794 became assistant-clergyman at Landsberg-on-the-Warthe, where he remained for two years. He then went to Berlin, and occupied himself partly in the translation of some of Blair's and Fawcett's Sermons, and in the redaction of the *Athenaeum*, conducted by his friend Friedrich Schlegel; but the first work that won for him general celebrity was his *Reden über die Religion*

(Discourses on Religion, Berl. 1799), which startled Germany from its spiritual torpor, vindicated the eternal necessity of religion, and sought to separate those elements of it that are essentially divine from the incrustations of dogma and the formalities of practice. Neander looked upon these *Reden* as making the turning-point in his spiritual career. They are now regarded as both making and marking an epoch in the theological history of Germany. The *Reden* were followed by the *Monologen*, and the *Briefe eines Predigers ausserhalb Berlin* in 1800. Two years later, he was appointed preacher at the Charity-house in the Prussian capital; and during 1804—1810, produced his famous translation of Plato, with commentary, which is considered in Germany, to this day, the most profound and penetrating treatise on the philosophy of the great Athenian, though English scholars are disposed to regard its criticism as decidedly too subjective, and in many important respects baseless. In 1801 appeared the first collection of his *Predigten* (Sermons), followed between 1808—1834 by no fewer than six other collections. They are masterpieces of penetrating and eloquent discussion, appealing equally to the heart and the intellect of hearers and readers. In 1802, S. went as court-preacher to Stolpe, where he published his *Grundlinien einer Kritik der bisherigen Sittenlehre*; and in 1804, was called to Halle as University-preacher and Professor of Theology and Philosophy. In 1807, he returned to Berlin, having previously published *Die Weihnachtsfeier, ein Gespräch* (Christmas Festival, a Dialogue, Halle, 1806), bearing on the calamitous state in which Germany then found herself, owing to the victorious insolence of the French. Among his next publications may be mentioned *Ueber den sogenannten ersten Brief des Paulus an den Timotheus* (Concerning the so-called first Epistle of Paul to Timothy, Berl. 1807). In 1809, he became pastor of Trinity Church, Berlin; and in 1810, when the university of Berlin was reopened, with a brilliant array of professors, under the rectorship of Fichte, no name shone more conspicuous than that of Schleiermacher. In 1811, he was chosen a member of the Berlin Academy of Sciences, in whose Transactions are to be found many valuable papers by S. on the ancient philosophy; and in 1814, secretary of the philosophical section. In 1817, he was appointed president of the synod assembled in Berlin. His latest, and perhaps his most important work is *Der Christliche Glaube nach den Grundsätzen der Evang. Kirche im Zusammenhange dargestellt* (The Christian Faith systematically presented according to the fundamental Propositions of the Evangelical Church, 2 vols. Berl. 1821—1822), in which his deepest and most Christian thought is visible. He died at Berlin, 12th February 1834. The list of S.'s disciples—i. e., of men who have derived the groundwork of their principles from him—is one of the most splendid that any theological reformer could shew, embracing, among others, the names of Neander, Nitzsch, Twisten, Olshausen, Lucke, Bleek, and Ullmann. In 1864, appeared a posthumous work of S., *Das Leben Jesu, Vorlesungen an der Universität zu Berlin im Jahr 1832*, in which he conceives of Jesus, as a man in whom the divine spirit works as perfectly as it possibly can in humanity, and treats his history accordingly. Strauss has replied in a critique (Berl. and Lond. 1865). S. was very far from what in England is called orthodox, but he was a great, earnest, devout Christian man, of massive understanding, and whose eloquence was scarcely less golden than that of Plato himself. Germany overflows with literature on S., his system, and his ideas.—For an account of his earlier life, see the

1840), a work which largely contributed to almost every branch of natural science. In 1840, he returned to Guiana, this time under the auspices of the British government, to complete his survey of that country, and survey the boundary-line between it and Brazil; and on his return in 1844, after the completion of his labours, he received the honour of knighthood. The *Description of British Guiana*, a valuable work, was the fruit of this expedition. In 1847, he published an excellent and elaborate *History of Barbadoes*, and in the following year departed for San Domingo, whither he had been accredited as British consul and representative. In this new sphere, he continued to pursue his geographical and scientific researches, the results of which he communicated in Reports to the Geographical Society till 1853. In 1857, he was appointed British representative to the Siamese court. He returned ill in 1864, and died next year.

SCHÖNBEIN, CHRISTIAN FRIEDRICH, a German chemist, was born at Mitzingen in Württemberg, 18th October 1799, studied natural science at Tübingen and Erlangen, and in 1824—1825 taught chemical physics at Keilhau, near Rudolstadt. To increase his knowledge, he visited England in 1826, repairing thence to Paris; and in 1828 he was called to a chair in the university of Basel, where his eminent qualifications were speedily recognised. In 1839, he discovered *Ozone* (q. v.), and invented *Gun-cotton* (q. v.) in 1845, obtaining from it by dissolution in ether the material called *Collodion* (q. v.). Of late years, he confined himself chiefly to experiments with oxygen. Of his works, which generally first appeared in periodicals, the chief are—*Das Verhalten des Eisens zum Sauerstoff* (Basel, 1837), *Beiträge zur physikalischen Chemie* (Basel, 1844), *Ueber die Erzeugung des Ozons* (Basel, 1844), *Ueber die langsame und rasche Verbrennung der Körper in atmosphärischer Luft* (1845). He died in 1868.

SCHÖNBRUNN, a royal palace in the outskirts of Vienna (q. v.), the summer residence of the imperial family.

SCHÖNEBECK, a manufacturing town of Prussia, ten miles south-east of Magdeburg, on the left bank of the Elbe. The chemical works, which give employment to from 250 to 300 men—the salt refineries, where the brine obtained from the abundant salt-springs is boiled down, and salt made to the annual value of 413,000 thalers—and the breweries and distilleries, are the principal industrial establishments. Pop. (1872) 9855.

SCHOOLCRAFT, HENRY ROWE, American author, geologist, and ethnologist, was born at Watervleit (now Guilderland), New York, March 28, 1793. He entered Union College in his fifteenth year, and studied French, German, Hebrew, chemistry, and mineralogy. In 1817—1818, he visited the mining region west of the Mississippi, sent a collection of minerals and geological specimens to Washington, and wrote *A View of the Lead Mines of Missouri*, &c. (8vo, New York, 1819), and a narrative, since enlarged, entitled *Scenes and Adventures in the semi-alpine Region of the Ozark Mountains of Missouri and Arkansas* (8vo, Philadelphia, 1853). In 1820, he was appointed geologist of an exploring expedition to the Copper Regions of Lake Superior and the Upper Mississippi. He was afterwards secretary of a commission appointed to investigate Indian claims and negotiate treaties, at Chicago. As the result of these labours, he made a report to the government, and wrote also *Travels in the Central Portion of the Mississippi Valley* (8vo, New York, 1825). In 1822, he was appointed Indian agent for the north-western frontier, and established himself at Sault Ste Marie. In 1823, he married Miss Johnston,

grand-daughter of an Indian chief, who had been educated in Europe. At this period, being in intimate relations with many Indian tribes, he devoted himself to the study of their history and ethnology. From 1828 to 1832, he was an active member of the legislature of Michigan Territory, and founded the Historical Society, and the Algic Society of Detroit. For his Lectures on the Indian Languages, he received the gold medal of the French Institute. Adding poetry to science, he wrote: *The River of the West*; *Geehale, an Indian Lament*; *Indian Manners*; *The Man of Bronze, or Portraits of Indian Character*; *Iosco, or the Vale of Norma*; also a grammar of the Algonquin language. In 1832, he was appointed to the command of an expedition, and discovered the sources of the Mississippi, the Narrative of which was published (8vo, New York, 1834). As superintendent and disbursing agent for the Indians, he negotiated treaties by which the government acquired lands to the extent of 16,000,000 acres. He visited Europe in 1842, and the following year he made a tour, chiefly for the observation of Indian antiquities, in West Virginia, Ohio, and Canada. In 1845, he collected the statistics of the Six Nations, and published *Notes on the Iroquois*, &c. (8vo, Albany, 1845). In 1847, the United States Congress authorised the publication of *Historical and Statistical Information concerning the History, Condition, and Prospects of the Indian Tribes of the United States*, in six volumes quarto, with 336 Plates by Major E. A. Mearns and others (Philadelphia, 1851—1857). He published *Algic researches*; *Thirty Years among the Indian Tribes of the North-western Frontier*; *Indian in his Wigwam*, &c. In 1847, he was married for the second time, to Miss Howard of South Carolina. He died in 1864.

SCHOOLMASTER, ARMY AND NAVY. In the Army, the schoolmaster is a non-commissioned officer of the first class, ranking next to a sergeant-major. His pay varies with length of service, rising gradually from 4s. a day on appointment to 8s. a day after long service. He has no advantage over other non-commissioned officers in quarters and certain allowances. To become an army schoolmaster, it is necessary either to be a certificated schoolmaster, or to have served an apprenticeship as a pupil-teacher, and to pass through a course of training for one year at the Normal School in the Royal Military Academy, Chelsea. After the completion of the training, a candidate is required to enlist as a common soldier for ten years' general service, whereupon he is immediately promoted to the rank of schoolmaster. A few of the most deserving schoolmasters are promoted to be sub-inspectors of schools, who rank as lieutenants, and have 10s. a day. The duties of the schoolmaster are to train the soldiers and their children the rudiments of knowledge, to examine the girls' school, and deliver lectures to the soldiers. There were in 180 army schoolmasters, besides 13 sub-inspectors.

In the Navy, the schoolmaster is a clerk, an officer, whose duties are analogous to those of an army schoolmaster, except that he has no younger than the ship's boys. Among the duties he teaches are the taking of solar and lunar observations, and the elements of navigation. His pay ranges from 4s. to 6s. a day.

SCHOOLMISTRESS, ARMY, is a post attached to each regiment or corps for the purpose of instructing the daughters of soldiers and sons under eight years old in the rudiments of English and in plain needlework. She must be a certificated schoolmistress, or a pupil-teacher.

a—embraces the distinguished names of Johannes Erigena Scotus (see ERIGENA), who cannot, however, be properly classed among the Scholastics; Gerbert of Aurillac, afterwards Pope Sylvester II. (q. v.); Berengarius (q. v.) of Tours; and Lanfranc (q. v.), Archbishop of Canterbury. A further development of Scholasticism occurred towards the middle of the 12th c., when Roscelinus opened up the question concerning the nature of universal conceptions, which led to the great struggle between the *Nominalists* (q. v.) and *Realists* (q. v.). This struggle terminated in the triumph of the latter; and henceforth, during the golden age of Scholasticism (the 12th and 13th centuries), it continued to be the prevalent mode of thought in philosophy. Still, however, Scholasticism regarded philosophy as dependent on theology. No one dreamed of doubting, or at least of disputing the truth of any of the church doctrines. These were alike too sacred and too certain to be so handled, and the only thing left or a humble philosopher to do was, in fact, to sort and systematise them: hence the expression *philosophia theologiae ancilla* (philosophy is the handmaid of theology), which has found its way down to modern times. Whatever did not directly belong to ecclesiastical dogma, was either neglected or treated in accordance with the vague traditions of Platonic or Aristotelian thought handed down from antiquity. Hence sprung that vast array of artificial subtleties and distinctions which had no better foundation to rest on than gross ignorance of the matters discussed, combined with a restless peculativeness. The formulas of logic were abused through an irrational realism, which regarded them not only as a means to the attainment of philosophical knowledge, but as the material organon of philosophy itself. At first, the dialectic treatment of dogma was only fragmentary, as we see it in the principal Scholastics of the 12th c., Gilbert de la Porrée, Alanus ab Insulis, and Petrus Lombardus (q. v.). During the 12th c., however, the increased intercourse of the West with the Arabs and Greeks led to a more definite acquaintance with the physical and metaphysical writings of Aristotle, though still only through the medium of incomplete translations, and in this way the circle of vision of the Scholastics at least widened, if it did not become clearer. From this period dates the almost *papal* authority of the great Stagyrte in philosophy, and the rise of the vast and elaborate systems of medieval theology. The three chiefs of Scholasticism in this, its highest development, were Albertus Magnus (q. v.), Thomas Aquinas (q. v.), and Duns Scotus (q. v.); around each of whom stand groups of more or less independent scholars and followers. The celebrity of such teachers was largely increased by the want of books, which compelled their pupils to rely upon their oral communications, and necessitated those extraordinary public disputations which were the only means 'philosophers' had of advertising their names in the middle ages. The honour paid to them by their admirers is visible in the epithets attached to their names; thus, Alanus is the *Doctor universalis*; Alexander Hales (q. v.), the *Doctor inrefragabilis*; Duns Scotus, the *Doctor subtilissimus*; Thomas Aquinas, the *Doctor angelicus*; Guillaume Durand of St Pourcain, the *Doctor solutissimus*, &c.

With Thomas Aquinas and Duns Scotus, Scholasticism culminated. After their time, various causes co-operated to bring about its decline and fall. The mystical theology (see MYSTICISM) gradually developed its natural antagonism to speculations resting on a basis of formal logic, and not appealing to the human heart and spirit. Such men as St Bernard (q. v.) of Clairvaux, and the

monks of St Victor at Paris, in the 12th c.; together with Bonaventura, in the 13th, were unconsciously hostile to the dominant style of thought; while in the 14th and 15th centuries, Tauler, Thomas à Kempis, Gerson, Nicholas of Clemangis, and others, deliberately set themselves against it. The very nature of the Scholastic thought was inimical to its own perpetuity. The hyper-logical, hair-splitting course which it followed produced rival systems, and results discordant with the doctrines of that theology which it undertook to support, until it finally laid down the astounding proposition, that a thing might be philosophically true and theologically false, and *vice versa*. The quarrels of the two great orders—the Dominicans and the Franciscans—each of which took part with its metaphysical chief; the former being called Thomists (from Aquinas), and the latter, Scotists (from Duns Scotus), materially injured the common cause of Scholasticism; and the revival of Nominalism under William of Occam (q. v.), its most distinguished advocate, powerfully contributed to the same result; but it was not till after the revival of letters had done its work of enlightening the judgment and purifying the taste of Europe, that Scholasticism was visibly in danger. The Reformation shook the system to its foundations—Luther himself leading the assault with the strength and valour of a Cœur-de-Lion; but still, so tenaciously did it cling to the semblance of life, that in the universities it held its footing till the 17th c., and even later. In fact, in some Roman Catholic states, such as Spain, it is still almost the only kind of philosophy going. The two great intellectual reformers whose writings mark the transition from the medieval to the modern mode of thought, are Lord Bacon (q. v.) and Descartes (q. v.), who may be said to have administered the death-blow to Scholasticism. The literature of this phase of speculation is enormous, and few critics have ventured far into its cob-webbed regions. For example, the printed writings of Albertus Magnus, Thomas Aquinas, and Duns Scotus, amount to 51 folio volumes; but however glad we may be that the reign of Scholasticism is over, and however thankful to men like Laurentius Valla, Erasmus, Rudolf Agricola, and Ramus, who riddled its ancient and time-honoured flag with the sharp shot of their wit and logic, we ought never to forget, that in ages when the conditions of scientific knowledge or refined taste did not exist, these old monkish dialecticians kept alive the philosophical faculty in Europe by the vivacity and restless ingenuity with which they prosecuted their fantastic speculations.

SCHOMBURGK, SIR ROBERT HERMANN, a celebrated traveller, was born at Freiburg in Prussian Saxony, June 5, 1804. He began at an early age to apply himself to geographical science and natural history, and subsequently made an abortive attempt to succeed as a tobacco-manufacturer in Virginia, United States. In 1830, he went to Anegada, one of the Virgin Isles, and having, by the advice of the governor, carefully surveyed the island, and laid a report before the Royal Geographical Society, he was charged by that learned body with the survey of Guiana in 1835. This enterprise, which was surrounded with formidable difficulties, he satisfactorily achieved, and from time to time laid the results of his investigations before the Society, in whose *Journal* they were regularly published. It was during this exploration, and while he was ascending the Berbice River, that he discovered, January 1, 1837, the magnificent aquatic plant denominated the *Victoria regia* (q. v.). On his return to England in 1839 he was presented with the medal of the Geographical Society for his *Travels and Researches in* 1835–1839 (Lond.

SCHOOLS, REGIMENTAL, in the British army, comprise the school for adults and boys above eight years of age, under the Schoolmaster (q. v.), and the infant and industrial schools under the Schoolmistress (q. v.), for girls and little boys. In the first, plain subjects are taught to soldiers who voluntarily attend, or to soldiers' children. The education is wholly secular: the only theological teaching being exposition of a portion of Scripture during the first half-hour of morning school; but even at this, attendance is at the option of the parents. The infant school is conducted on similar principles. The industrial school is to fit girls for the occupations of life, and to render them capable of entering domestic service; a grant of money is made by government for the provision of materials. There is a school of each sort in every battalion of infantry or regiment of cavalry, the total cost of which amounts, for 1873—1874, to £36,253. Adult soldiers are admitted gratuitously; for children, there is a nominal charge of 1d. each a month. The orphans of soldiers and the children of soldiers serving abroad are received at any neighbouring school without payment; those of pensioners, contractors, &c. at 3d. a month; and the children of officers at 6s. a month. It is forbidden that any difference should be made in the schools in the treatment of these different classes of pupils.

SCHOONER is a swift, sharply-built vessel, carrying usually two masts, though occasionally a greater number, and commonly is of small size. There are two classes of schooners—the 'fore-and-aft schooner,' or schooner proper, and the 'topsail schooner.' In the former, both foremast and mainmast are rigged like the mainmast of a cutter, with fore-and-aft sails. In the latter, the foremast carries a square topsail and a square topgallant-sail. Off a

Topsail Schooner.

wind, the former rig has a great advantage, as the schooner can sail up within 4½ or even 4 points of the wind; but before the wind, the square topsail gives the advantage to the topsail schooner; and as the latter can on occasion strike her squaresails, and set a fore-and-aft topsail in their place, she has usually the preference. No sailing-vessel is faster than a schooner of fine build, when she carries ample canvas; hence it is a favourite form for the larger class of yachts; and before the introduction of steam dispatch-vessels, was employed much in the packet service. Schooners are still employed in the navy as revenue cruisers; and to a great extent in the merchant service, for running small

cargoes, and especially those of perishable goods, as fish or fresh fruit. They are easily managed by a

Fore-and-aft Rigged Schooner.

small crew; but from the sharpness of their hull have no great amount of stowage.

SCHOPENHAUER, ARTHUR, a German philosopher, son of Johanna Schopenhauer, an author of considerable distinction (born 1770, died 1859) was born at Danzig, 22d February 1788. He was first at Göttingen, where the lectures of Schlegel inspired him with a love of philosophy, and afterwards at Berlin and Jena, in the last of which places he graduated in 1813. During the same year he published his first treatise, *Ueber die Natur der Wurzel des Satzes vom zureichenden Grunde* (Bast. 1813, 2d ed. Frankf. 1847), in which he lays down the logical basis of his future system. S. spent the winter of 1813 at Weimar, where he enjoyed the society of Goethe, and the orientalist Friedrich Schlegel, who first turned his attention to the ancient Greek literature and philosophy, the study of which exercised a great influence on his future development. He then proceeded to Dresden, where he published a treatise on Sight and Colour (*Ueber das Sehen und die Farben*, Leip. 1816), which was followed, two years later, by his great work, *Die Welt als Will und Vorstellung* (The World considered as Will and Idea, Leip. 1819; 2d ed. 1844). After 1818 S. lived partly in Italy and partly in Berlin, until 1831, when he fixed himself in Frankfurt-am-Main, devoting himself uninterruptedly to the elaboration of his system. The fruits of his studies were *Ueber den Willen in der Natur* (Frankf. 1836), *Ueber die Freiheit des Willens*, *Ueber das Fundament der Moral*, the supplements to his principal work, which appear in the 2d edition of 1844; and *Paralipomena* (Berl. 1851). He died September 21, 1860. The fundamental doctrine of S. is, that the only essential reality in the universe is the Will; that what are called appearances exist only as subjective representations, and are merely the forms under which single original will shews itself. The will is not necessarily accompanied by self-consciousness, though it ever strives after its attainment; and hence S. declared himself the uncompromising opponent of all the contemporary systems—those of Fichte, Schelling, and Hegel—in which the Absolute Reason, 'Consciousness,' &c., are posited as the necessary basis of thought. For his great work S. professed the most unmeasured scorn—of Hegel, for example, a mere 'scribbler of nonsense'—and in return was treated by them with scorn.

overeign contempt, that for years his name was almost unknown to the majority of German students. His theories of ethics and aesthetics also rest on peculiar and not very intelligible grounds. The best account of S.'s philosophy is to be found in Frauenhildt's *Briefe über die Schopenhauersche Philosophie* (Leip. 1854).

SCHORL. See TOURMALINE.

SCHORL ROCK is a granitoid rock, in which mica is replaced by schorl or tourmaline. Some specimens occur in which the felspar is also absent, and the mass is composed entirely of quartz and schorl. Schorl rocks are rare, occurring probably only as small bosses in granite.

SCHOTTISCHE (Ger. *Scottish*) a somewhat fanciful name given to a slow modern dance in $\frac{3}{4}$ time.

SCHOUWEN (frequently also called LAND-VAN-ERIKZER), an insular portion of the province of Friesland (q. v.), bounded on the S. by the Scheldt, on the N. by the most southern branch of the same, and on the W. by the North Sea. Area, 1 sq. m.; pop. 15,600. The surface is low, and the island is protected on both sides by dykes. Agriculture is the chief employment of the inhabitants; the soil is fertile, and the principal crops are grain, oil-seeds, and flax. Seafowl in immense numbers breed on the south side of the island, and the sale of their eggs is an important item in the trade. Zierikzee (pop. 7100), which is the principal town.

SCHREVELIUS, CORNELIUS, a Dutch scholar, whose name was once better known than it is now, was born at Haarlem in 1615, and educated mainly by his father. In 1642, he succeeded his father as tutor of the university of Leyden, and died 11th September 1664. S. was a laborious and erudite man, but possessed little critical discernment. His most notable performance was a *Lexicon Manuale, seu Latinum et Latino-Grecum* (Leyden, 1654, 57, 1664), of which there have been innumerable editions. It was long extensively used as a textbook in English schools, and in the absence of anything better, deserved perhaps the respect which obtained; but otherwise it cannot be pronounced good dictionary. It is not at all exhaustive of words in the Greek language; it does not sufficiently explain their different meanings, and its etymologies are often erroneous and inept. S. also executed many *variorum* editions of the classics, several (1648), Hesiod (1650), Terence (1651), Virgil (1652), Horace (1653), Homer (1656), Martial (1656), Lucan (1658), Quintus Curtius (1658), Justin (1659), Sævo (1661), Ovid (1662), and Claudian (1665). These editions are remarkable for their correctness, and for the excellence of the paper and typography, but the notes are deficient both in taste and acumen.

SCHUBERT, FRANZ, a German musical composer, who was born at Vienna in 1807, and died at an early age of 25. During his lifetime, his works attracted little notice, but they acquired a high and deserved reputation after his death, and have gained for their composer a large share of posthumous fame. His songs and ballads are hardly to be surpassed for masterly construction and richness of melody, while they are full of simple, ornate, and expressive melody. S. also composed several operas, symphonies, sonatas, and other larger works.

SCHUMANN, ROBERT, a modern German musical composer of considerable note. He was born at Zwickau, in Saxony, in 1815, and studied chiefly at Leipzig. He is looked on in Germany as one of the founders of a new musical school, of which the other principal exponent is Richard Wagner. His school has undertaken to say what the 'music

of the future,' or as some of the school express it, 'work of art of the future,' is to be. Whatever may be said as to S.'s relation to the future, his influence on the music of the present day has been very considerable. English musicians have, however, hesitated to agree with his countrymen in placing him on an equally exalted pinnacle with Beethoven. His compositions evince deep study of Sebastian Bach, as well as a large share of individuality, freshness, and scientific knowledge. They continually surprise us by startling modulations, and the frequent interruptions in the time impart to them an air of eccentricity. S.'s works comprise several symphonies, a cantata called *Paradise and the Peri*, and a number of small pieces, which have obtained more favour in this country than his larger compositions. S. married Mademoiselle Clara Wieck, one of the most celebrated of living pianists, and died in 1856.

SCHUYLKILL, a river of Pennsylvania, U.S., which rises in the carboniferous highlands of the eastern centre of the state, and flowing 120 miles south-east, empties into the river Delaware 5 miles below Philadelphia.

SCHWANTHALER, LUDWIG MICHAEL, a celebrated German sculptor, was born in 1802 at Munich, where his father, Franz Schwanthaler, practised the same art. Young S. entered his father's workshop at the age of 16; and on the death of the latter in 1821, he undertook to carry on his father's business. His first important commissions were received in 1824 from King Maximilian. After a brief residence in Rome, he set up a studio of his own at Munich, and shortly after executed for the *Glyptothek* there two fine bas-reliefs from Homer: 'Achilles struggling in the Scamander,' and the 'Battle by the Ships,' besides a statue of Shakespeare for the saloon of the theatre, and the Bacchus-frieze for the Banqueting-hall in the palace of Duke Maximilian. In 1832, he revisited Rome, for the purpose of preparing models for that portion of the national monument of Valhalla intrusted to his supervision. He remained two years. On his return to Munich, he began his bas-reliefs to illustrate Pindar's *Epinikia* (Triumphal Odes) and the myth of Aphrodite, the latter of which is a frieze. In 1835, he was appointed professor at the Munich Academy. Henceforth, the interest of his career is mainly professional; but the number of his works is singularly great, while their excellence is such as to place him in the first rank of German sculptors. His distinguishing characteristics are a thorough originality of design, and boldness of imagination; while the extraordinary extent of his acquaintance with the sculpture of Greece and of the Middle Ages gave a great richness and variety to his execution of details. Among his works may be mentioned 24 statuettes in the *Pinakothek* at Munich; the great bas-relief frieze (in the Barbarossa Hall), more than 200 feet long; the models for the 12 statues of the Ancestors of the House of Wittelsbach, the 15 colossal statues for the front pediment of the Valhalla, the models of the 15 statues of the 'Battle of Arminius' for the northern end of the same structure, and the model of the colossal statue of Bavaria, 54 feet high; a marble statue of the Emperor Rudolf for the cathedral of Spire, models for the statues of Goethe and Jean Paul Richter, a statue of Mozart, marble groups of Ceres and Proserpina (at Berlin), &c., besides numerous other works executed by his pupils from his designs. He died in 1848.

SCHWARZ, CHRISTIAN FRIEDRICH, a distinguished German missionary, was born at Sonnenburg, in Brandenburg, October 26, 1726. He studied at Halle, and having resolved to become a

missionary in the East Indies, obtained ordination at Copenhagen, with the view of joining the Danish mission at Tranquebar, where he arrived in 1750. His career is a beautiful example of what may be accomplished when piety, integrity, good sense, and a charity that knows how to prevent the virtue of zeal from lapsing into the vice of fanaticism, unite harmoniously in a man. After labouring 15 years at Tranquebar, he went to Trichinopoly, where he founded a church and school, and also acted as chaplain to the garrison. Here the fruits of his long and consistent career of pious activity gradually began to shew themselves in considerable conversions from Hinduism. In 1777, another missionary was sent to his assistance; and by the permission of the Rajah of Tanjore, whose friendship he had acquired, he built a church in that city. So highly did the native rulers admire his integrity, that once, when Hyder Ali, of Mysore, was arranging terms of peace with the Madras government, he demanded that S. should act as their agent—'him, and no other one,' said the Sultan, 'will I receive and trust.' On this occasion, S. resided three months at Seringapatam. During the terrible Carnatic war which soon after followed (1781—1783), and for which S. thought the British were to blame, a striking testimony was given of that universal respect entertained for his character. The inhabitants and garrison of Tanjore were dying of starvation, and neither the British nor the Rajah could induce the cultivators to sell them provisions. In despair, S. was appealed to, and when he gave his word that payment should be made, the farmers believed him, and sent the requisite supplies. On the death of the Rajah of Tanjore in 1787, S. was appointed tutor and guardian of his young son, Maha Sarboji, who turned out, under S.'s care, one of the most accomplished sovereigns in or out of India. S. died February 13, 1798.

SCHWARZBURG, House of, one of the oldest German families, founded about the middle of the 12th c., by Sizzo, Count of Schwarzburg and Käfernburg. The two sons of Sizzo were Heinrich, who succeeded his father as Count of Schwarzburg, and Günther, who became Count of Käfernburg. The former, dying childless in 1184, his possessions went to his brother, who left two sons, Günther, who continued the family of the Counts of Käfernburg, and Heinrich, from whom sprung the Counts of Schwarzburg. In 1349, Günther XXI., the younger son of Heinrich XII., was elected Emperor of Germany, but he died within the year of his election. Count Günther XL. of Schwarzburg and Arnstadt, who introduced (1541) the reformation into his states, was the common ancestor of the two existing lines of the Schwarzburg family; his son, Johann Günther, founding the line of Schwarzburg-Sondershausen (q. v.), and Albert, that of Schwarzburg-Rudolstadt (q. v.).

SCHWARZBURG-RUDOLSTADT, a German principality, bounded on the E. by Weimar, Altenburg, and Meiningen, with a detached part, 30 miles to the north, in Prussian Saxony. Area, 367 sq. m., pop. (December 1871) 75,523, of whom 75,294 were Lutherans. It consists of the Upper Lordship (*Rudolstadt*, 282 sq. m.) and the Lower Lordship (*Frankenhäusen*, 85 sq. m.). The Schwarz, Ilm, and Saale water the surface, which is for the most part covered with spurs of the Thuringerwald. The ordinary crops are raised, and timber, salt, and metals are the principal products. The principality contains many spots distinguished for beautiful scenery; and besides the vale of the Schwarz, the convent ruins of Paulenzelle, and the remains of the castle of Kyffhausen, attract many visitors. S. has

a diet of 16 members, of whom 12 are chosen in a general election. S. has one vote in the federal council, and one in the diet.

SCHWARZBURG-SÖNDERSHAUSEN, German principality, is partly surrounded by Prussian Saxony. Area, 333 sq. m.; pop. 67,191, mostly Protestants. It consists of a Lower Lordship (*Sondershausen*) and an Upper Lordship (*Arnstadt*). The former of these, watered by the Helbe and Wipper, is fertile and agricultural; the latter is mountainous, and is the seat of manufactures. The diet contains 5 members nominated by the prince, 5 chosen by the most heavily taxed, and 5 by general election. S.-S. has one vote in the federal council, and sends one representative to the imperial diet.

SCHWARZENBERG, a princely family of many, dates from 1420, when *Erkinger von S.* purchased the lordship of S. in Franconia, and raised (1429) by the Emperor Sigismund to the dignity of Baron of the Empire. Two of this family have acquired a European reputation: the first, ADAM, Count of S., who was born in 1557, became prime-minister and adviser of George Wilhelm, Elector of Brandenburg. He was all-powerful during the Thirty Years' War, and brought terrible calamities on Brandenburg by his determined adherence to the alliance with Austria against the Protestant league, for which he was punished at the accession of the 'Great Elector,' in 1648, being despoiled of his power, and imprisoned in the fortress of Spandau, where he died 17th March 1656. The other, KARL PHILIPP, Prince of S., was born at Vienna, 15th April 1771, first served against the Turks, and had risen to the grade of lieutenant-field-marshal in 1799, at which date he raised a regiment of Hulus at his own cost. He was the orders of Mack in the campaign of 1805, commanded a division at Ulm; but when it was found that the battle was lost, he cut his way through the French army, and retired with his regiment to Eger, afterwards taking part in the great battle of Austerlitz. He was ambassador at the Russian court in 1803, by the express wish of the Emperor Alexander; fought at Wagram in 1809; and, after the treaty of Vienna, conducted the negotiations preliminary to the matrimonial connection of Napoleon with the Hapsburg family; and both in this capacity, and as ambassador at Paris, so gained the confidence of Napoleon, that the latter expressly demanded him the post of general-in-chief of the Austrian contingent of 30,000 men which had been sent to aid France against Russia in 1812. S. with his army entered Russia from Galicia, passed the Niemen, and achieved some slight successes, but was afterwards driven into the 'duchy of Warsaw' (POLAND), and took up a position at Pultava, where he concluded with the Russians an armistice which secured the French retreat. S. was much criticised for his dilatory conduct at the time; and his indolence, ascribed by the French historians to instructions from his own government, has been much animadverted upon by them; but nevertheless Napoleon concealed any dissatisfaction he might have felt, and demanded (1813) for him the Austrian government the baton of field-marshal. After a brief sojourn at Paris, S. was appointed to the command of the Austrian army of observation in Bohemia; and when Austria joined the coalition, he became generalissimo of the army, gained the victory of Leipzig, and introduced a cautious system of tactics, which insured a progressive hemming-in of the French, in spite of their occasional successes, until they wore them out. On the return of Napoleon

Elba, he obtained the command of the allied army in the Upper Rhine, and a second time entered France. On his return to Vienna, he was made resident of the imperial council for war, received an extensive grant of lands in Hungary, and was allowed to engrave the imperial arms of Austria on his escutcheon. He died of apoplexy at Leipzig, 5th October 1820.—His nephew, FELIX LUDWIG JOHANN FRIEDRICH, born October 2, 1800, distinguished himself in the Italian campaign of 1848, was placed at the head of affairs at Vienna, called to the aid of the Russians against Hungary, and pursued a bold policy in Germany. He died at Vienna, April 5, 1852.

SCHWEDT, a handsome town of Prussia, in the province of Brandenburg, on the Oder, 31 miles north-south-west of Stettin. Weaving, brewing, the manufacture of soap and of tobacco, which is extensively grown and sold, are the principal branches of industry. Pop. (1872) 9039.

SCHWEIDNITZ, a charmingly situated town of Prussian Silesia, on the left bank of the Weistritz, 7 miles south-east of Liegnitz, and about the same distance south-west of Breslau by railway. It is well fortified. Woollen goods, leather, and agricultural implements are manufactured; and the fairs for corn, cattle, and yarn are much frequented. It was besieged and taken four times within 50 years, the last time by the French in 1807, when its defences were in great part destroyed. Pop. (1872) 16,998.

SCHWEINFURT, an ancient, and long an imperial free city, the *Trajectus Suevorum* of the Romans, now a town of Bavaria, in Lower Franconia, on the Main, 29 miles north-east of Würzburg by railway. It contains a beautiful market-place, in which important cattle and wool markets are held. Wine-culture, sugar-refining, and manufactures of chemicals and dyeing materials, as white, ultramarine, Schweinfurt Green, &c., are carried on. See GREEN. Pop. (1872) 10,325.

SCHWERIN, capital of the grand duchy of Mecklenburg-Schwerin, is agreeably situated on the north shore of the Schweriner See. The Schweriner See, or Lake of Schwerin, is 14 miles in length, and 3 miles broad, and abounds in fish. S. is divided into the old town, the new town, and the suburb, well built, and contains a Gothic cathedral, one of the finest edifices of the kind in Northern Germany, begun in 1248, and finished in the 15th century. The ducal castle, occupying the site of the former castle, erected by Wallenstein, stands on a small island. In S. there are tobacco-factories, an iron-foundry, breweries, &c. Pop. (1872) 26,804.

SCHWYZ, one of the mountain cantons in the middle of Switzerland, is bounded on the N. by the canton of St Gall, and the canton and Lake of Uri, and on the S. by the canton of Uri and the Lake of Lucerne. Area, 350 sq. m.; pop. (December 1870), 47,705, of whom 47,047 are Catholics. The whole surface is covered with mountains, except small tracts in the south-west and north-west; but there are no glaciers nor any everlasting snow except on the Rieselstock, 8890 feet high, on the east frontier. The canton comprises a third part of Lake Zug, the most northern angle of the lake of the Four Cantons, the whole of the mountain-mass of the Righi (q. v.), the plain in which lies the small Lake Lowerz, and the valleys of the Luotta, Sihl, and Aa, which are the principal rivers. Cattle-breeding is the employment of almost the whole of the inhabitants, and the number of cattle is estimated at about 20,000. Only about one-fourth of the whole area is cultivable; fruits and

wine are cultivated to some extent; and cattle, cheese, and timber are exported. Such woven fabrics as are required for home use are almost the only manufactures. (1870—pop. 47,705.)

S., one of the three original cantons, and also one of the Four Forest Cantons, has supplied the name to the whole country of which it forms a part. The government is a representative democracy.—SCHWYZ, the capital, is a small town, containing a beautiful parish church, and most picturesquely situated 17 miles east of Lucerne.

SCIA'CCA (anc. *Therma Seluntina*), a city of Sicily, in the province, and 30 miles west-north-west of the city of Girgenti, stands on the slope of a hill, the foot of which is bathed by the sea, and is defended by the castle of Luna. It is surrounded by old walls, and has a fine cathedral. Outside the walls are the hot springs; and upon a neighbouring height, there are the so-called *Stufe di St Calogero*. There is a well, at the bottom of which a subterranean noise is heard resembling that of a torrent of rain or of a cascade. The baths are frequented by invalids, and have several grottoes with seats hollowed out in the rock for the accommodation of the bathers. Pop. 14,292.

S. is a seaport well adapted for the exportation of grain, and has many store-houses. It was the birthplace of Agathocles, tyrant of Syracuse, and of Fazelli the historian.

SCLE'NIDÆ, a family of acanthopterous fishes, somewhat resembling perches; having a compressed body; a simple or double dorsal fin, the first part spiny; the gill-covers variously armed; the head generally inflated, and its bones cavernous; the scales ctenoid, and in general obliquely ranged. The air-bladder is often furnished with branching appendages. The S. are divided into many genera, and widely distributed. Most of them are marine, but a few inhabit fresh water. Only two species are reckoned as British, the Maigre (q. v.) and the Bearded Umbrina (q. v.), both excellent for the table, as are many others of the family. The power of emitting sounds which belongs to the Maigre is possessed also by others of the family in a remarkable degree. Among these are species of *Pogonias*, as *P. chromis*, which inhabits the coasts of Georgia, Florida, &c., and is known, as are others of the family, by the name DRUMFISH, because the sound which it emits resembles that of a drum. It attains a large size, and its flesh is very good, but the tail is often infested with *Parasitæ*. In vessels anchored on the coasts which it inhabits, sleep is sometimes almost impossible from the continual drumming carried on all night, accompanied with a tremulous motion of the vessel. How the sound is produced, is not well known.

SCIA'TICA is the term given to neuralgia of the great sciatic nerve. See NERVOUS SYSTEM. It has been shewn by Graves to be a frequent complication of gout; but rheumatism, or, perhaps, rather the exposure to cold and wet which so often sets up rheumatism, is its most common cause. It is one of the most obstinate forms of neuralgia. It is characterised by irregular pains about the hip, especially between the great trochanter of the thigh-bone and the bony process on which the body rests when sitting, spreading into neighbouring parts, and running down the back of the thigh to the leg and foot; or the pains may occupy only isolated parts, as the knee-joint, the calf of the leg, or the sole of the foot. The treatment is the same as that of neuralgia generally, except when the disease is merely a complication of gout, in which case the primary disease must be attacked as well as the sciatica.

SCIATIC STAY (possibly a corruption of Asiatic), in merchant-vessels, is a strong rope

fastened between the main and foremast heads. When loading or unloading, a travelling tackle is suspended to it, which can be brought over the fore or main-hatchway as occasion demands.

SCIENCE, the name for such portions of human knowledge as have been more or less generalised, systematised, and verified. Generality as opposed to mere particulars, system as opposed to random arrangement, and verification as opposed to looseness of assumption, concur in that superior kind of knowledge dignified by the title in question. Geography, Chemistry, and Political Economy are now sciences. The first has been so for many ages, although greatly advanced in recent times; the two last, scarcely more than a century. Chemical facts and maxims of political economy had been known from a much earlier date, but they did not in either case amount to science; the generalities were few or bad, system and certainty were both wanting. In the different branches of Natural History—Mineralogy, Botany, Zoology—there had been a large store of accumulated facts before any one branch could be called a science. The *quality* of the knowledge is of more consequence than the quantity.

The term *Philosophy* (q. v.) is to a certain extent, but not altogether, coincident with science, being applied to the early efforts and strainings after the explanation of the universe, that preceded exact science in any department. Both names denote the pursuit of knowledge as knowledge, or for intellectual satisfaction, in contrast to the search that is limited to immediate practice or utility.

The sciences have been variously classified, and the principles of their classification have been a subject of discussion. We shall here describe the mode of classifying them in accordance with present usage, and with the principles most generally agreed upon.

It is convenient to prepare the way by distinguishing between Theoretical Sciences, which are the sciences properly so called, and Practical Sciences. A Theoretical Science embraces a distinct department of nature, and is so arranged as to give, in the most compact form, the entire body of ascertained (scientific) knowledge in that department: such are Mathematics, Chemistry, Physiology, Zoology. A Practical Science is the application of scientifically obtained facts and laws in one or more departments to some practical end, which end rules the selection and arrangement of the whole; as, for example, Navigation, Engineering, Mining, Medicine. Navigation selects from the Theoretical Sciences—Mathematics, Astronomy, Optics, Meteorology, &c.—whatever is available for guiding a ship on the seas, and converts the knowledge into rules or prescriptions for that purpose. The arts that can thus draw upon the exact sciences are by so much the more certain in their operation; they are the scientific arts.

Another distinction must be made before laying down the systematic order of the Theoretical Sciences. A certain number of these sciences have for their subject-matter each a separate department of natural forces or powers; thus, Biology deals with the department of Organised Beings, Psychology with Mind. Others deal with the application of powers elsewhere recognised to some region of concrete facts or phenomena. Thus, Geology does not discuss any natural powers not found in other sciences, but seeks to apply the laws of Physics, Chemistry, and Biology to account for the appearances of the earth's crust. The sciences that embrace peculiar natural powers are called Abstract, General, or Fundamental Sciences; those that apply the powers treated of under these to regions of concrete

phenomena are called Concrete, Derived, or Applied Sciences.

The Abstract or Theoretical Sciences, as most commonly recognised, are these six: Mathematics, Physics, Chemistry, Biology (Vegetable and Animal Physiology), Psychology (mind), Sociology (society). The Concrete Sciences are the Natural History Group—Meteorology, Mineralogy, Botany, Zoology, Geology, also Geography, and we might, with some explanations, add Astronomy. The Abstract or Fundamental Sciences have a definite sequence, determining the proper order for the learner, and also the order of their arriving at perfection. We proceed from the simple to the complex, from the independent to the dependent. Thus, MATHEMATICS relates to *Quantity*, the most pervading, and fundamental, and independent attribute of the universe. The consideration of this attribute is therefore a natural priority; its laws underlie all other laws. As Mathematics is at present understood, it has an Abstract department, which treats of quantity in its most general form, or as applied to nothing in particular—including Arithmetic, Algebra, and the Calculus—and a Concrete or Applied department—viz., *Geometry*, or Quantity in Space or Extension. It has been suggested that General Mechanics, or the estimation of Quantities of Force, should be considered a second Concrete department. But usually Mechanics ranks as the next Fundamental Science in order, and as Physics.

NATURAL PHILOSOPHY has long been considered the name of a distinct department of science; the designation PHYSICS is now more common. This science succeeds Mathematics, and precedes Chemistry. Of all the fundamental sciences, it has the least unity, being an aggregate of subjects with more or less connection. Mechanics, Hydrostatics, Hydraulics, Pneumatics, Acoustics, Astronomy, are all closely related; they represent the phenomenon of movement in *mass*, as applied to all the three states of matter, Solid, Liquid, and Gas. The remaining subjects—Heat, Light, and Electricity—together with the attractive and repulsive forces that determine Cohesion, Crystallization, &c., are described as relating to movement in the *molecule*. We have thus Molar Physics and Molecular Physics; and the tendency is now to treat of these two separately.

CHEMISTRY lies between Physics and Biology, reposing upon the one, and supporting the other. It assumes all the physical laws, both molecular, as known, and proceeds to consider a special phenomenon of the composition and decomposition of bodies considered as taking place in definite proportions, and leading to change of properties. The composition of a cup of tea—water, sugar, milk, and infusion of tea-leaf—is physical; the composition of marble from oxygen, carbon, and calcium, is chemical. In the one case, the properties of the separate ingredients are still discernible; in the other, these are merged and untraceable.

BIOLOGY, or the science of living organisms, involves mathematical, physical, and chemical laws in company with certain others, called vital laws, most usually expounded under the designation of Vegetable and Animal Physiology; and it has Concrete departments, Botany, Zoology, and Anthropology.

PSYCHOLOGY, or the Science of Mind, marks a wide transition, the widest that can be taken within the whole circle of the sciences, from the material world, to the world of Feeling, Thought, and Intellect. The main source of our knowledge of mind is self-consciousness; and it is only by

the intimate connection of mind with a living organism, that the subject is a proper sequel to Biology. Not until lately has any insight into mind been obtained through the consideration of the physical organ—the brain ; so that Psychology might have been placed anywhere, but for another consideration that helps to determine the order of the sciences—viz., that the *discipline*, or method, of the simpler sciences is a preparation for the more abstruse. Mathematics and Physics especially are an admirable training of the intellect for the studies connected with mind proper, although the laws of Physics may not of themselves throw any direct light on the successions of thought and feeling.

These five sciences embrace all the fundamental laws of the world, and, if perfect, their application would suffice to account for the whole course of nature. To a person fully versed in them, no phenomenon of the explained universe can appear strange; the Concrete sciences and the Practical sciences contain nothing fundamentally new. They constitute liberal scientific education. It is not uncommon, however, to rank Sociology, or the Laws of Man in society, as a sixth primary science following on psychology, of which it is a special development.

Dr. Neil Arnott, in his work on *Physics*, first published in 1823, gave as the primary departments of Nature—Physics, Chemistry, Life, and Mind (under which he would include the Laws of Society). He did not discard Mathematics, but looked upon it as a system of technical mensuration, created by the mind to facilitate the study of the other sciences, as well as the useful arts. The natural laws expressed by Mathematics are few and simple, and the body of the science consists of a vast scheme of numerical computation, whose value appears in its applications to Astronomy and the other physical sciences.

Auguste Comte, who, in his *Cours de Philosophie positive*, went over the entire circle of the Theoretical, abstract, or Fundamental sciences, enumerated these as follows: Mathematics, Astronomy, Physics, Chemistry, Biology, Sociology. He thus detaches Astronomy from Physics, considering it as the exact science that brings forward and works out the Law of Gravitation. He has no distinct science of Psychology, an omission that has been generally admitted.

Mr Herbert Spencer, in a tract on the *Classification of the Sciences*, takes exception to the scheme of *ente*, and proposes a threefold division, according to the gradations of Concreteness in the subject-matter. The first group is termed ABSTRACT SCIENCE, and treats of the *forms* of phenomena detached from their embodiments. The most comprehensive forms are Space and Time; and the ones corresponding are Mathematics and Logic. The second group is ABSTRACT-CONCRETE SCIENCE, the phenomena of nature analysed into their separate elements—Gravity in the abstract, Heat the abstract—as in Physics and Chemistry. These are two of the fundamental sciences in every sense, and they are called Abstract-Concrete by Mr Spencer, in comparison with the foregoing class. A great principle, of recent introduction, termed the Law of Correlation, Conservation, or Persistence of Force, serves to connect Physics with Chemistry, and imparts to the two taken jointly a greater unity than belongs to Physics singly. The third and last group is CONCRETE SCIENCE, or natural phenomena in their totalities, or as united in actual beings—Astronomy, Biology, Psychology, Sociology, Geology, &c. Mr John Stuart Mill, in an article in the *Westminster Review*, April 1865, has described *ente's* scheme at length, and also criticised that of *en-er*.

It may be held as generally admitted that Mathematics, Physics, Chemistry, Biology, and Psychology, with or without Sociology, are the sequence of the primary or fundamental sciences, and that the Natural History group, from not containing any new laws of nature, are not fundamental. Astronomy, or the laws of the solar system, and of the other celestial bodies, might be called a Natural History or Concrete science, if we supposed a prior abstract science that discussed the operation of gravity, together with the laws of motion in bodies generally, or without special application to the existing solar and sidereal systems. The first book of Newton's *Principia* would be the Abstract, the third book the Concrete, form of the science.

The Practical Sciences do not admit of any regular classification. They are as numerous as the separate ends of human life that can receive aid from science, or from knowledge scientifically constituted. Connected with Mind and Society, we have Ethics, Logic, Rhetoric, Grammar, Philology, Education, Law, Jurisprudence, Politics, Political Economy, &c. In the manual and mechanical arts, there are Navigation, Practical Mechanics, Engineering Civil and Military, Mining and Metallurgy, Chemistry applied to Dyeing, Bleaching, &c.

The medical department contains Medicine, Surgery, Midwifery, Materia Medica, Medical Jurisprudence. A science of Living, or of the production of Happiness by a skilled application of all existing resources, was greatly desiderated by Plato, and would be the crowning practical science.

SCI'LLA. See SQUILL.

SCYLLY ISLANDS. These islands, situated a little west of 6° W. long., and about 50° N. lat., are the most southern parts of the United Kingdom of Great Britain, if we except the Channel Islands. The group consists of about 40, comprising a circuit of about 30 miles; and their general denomination is derived from a very small island, about an acre in extent, and almost inaccessible, called Scilly, probably from its position near dangerous rocks, similar to that of Scylla near Sicily. By the ancients, these islands

Scilly Islands.

were named Cassiterides, Hesperides, and Siluræ Insulæ. It would seem that the term Cassiterides, or 'Tin Islands,' under which they were known to the Greeks and Romans, was once applied to the peninsula of Cornwall, or at least before the Roman settlement in Britain, there was some confusion between the S. I. and the peninsula of Cornwall. The inhabitants of Cornwall are said to have brought tin to these islands, where it was shipped off by foreign merchants.

Numerous remains may be seen of rude pillars,

circles of stones, kistvaens, rock-basins, and crom-lechs. The granite of which the islands are composed is, in general, of a rather coarse quality, and from its colour, iron seems to be frequently associated with it. There are metalliferous veins, or lodes, in some of the rocks, but none that could have yielded any considerable quantity of ore. The S. I. were in 936 granted by Athelstane to some monks who settled at Tresco. They were afterwards granted to the Abbey of Tavistock by Henry I., and were conferred by Queen Elizabeth on the Godolphin family. They are now the property of the crown.

Only five of the islands are inhabited. St Mary's, the largest, comprises 1523 acres; Trescoe, 697; St Martin's, 515; St Agnes (a light-house station), 313; Sampson and Bryher, 269. The inhabitants are chiefly engaged in agriculture. Barley, oats, and a little wheat are grown. Large quantities of potatoes are sent to London and Bristol. Fishing, though not to any great extent, occupies some portion of the population. The climate is mild. The soil is in general sandy, but in Trescoe and St Agnes it is remarkably fertile. The cliffs abound with sea-fowl, and are covered with samphire.

St Mary's had, in 1871, a population of 1383, while the other four inhabited islands (Trescoe, St Martin's, St Agnes, Bryher) were collectively inhabited by only 707 persons. Hugh Town is the capital, and contains an odd mixture of old-fashioned and neat modern houses. The pier, built in 1750 by Lord Godolphin, has been much improved by Mr Smith, the present lessee of the islands. The custom-house and post-office are in the centre of the town. Some remains of the old church are still seen in the fields, on the southern side of the island. The modern church, at the east end of the main street, is seated on rising ground, and forms a conspicuous object in the panorama of the islands.

At Trescoe are the remains of an abbey founded in the 10th century. Among the objects of curiosity on this island are the ruins of Oliver Cromwell's camp, castle, and battery, built by the Parliamentarians under Blake and Ayscough. At Dolphin Down may be seen traces of ancient mining.

St Agnes is about three miles south-west from St Mary's. It is well cultivated, and is surrounded by some fine rock-scenery. The principal attraction is the light-house, 78 feet high, containing a revolving light, seen at a distance of 18 miles.

Scimitar.

SCIMITAR, a description of sword used among eastern nations. It is considerably curved, and has its edge on the convex side. Being usually of high temper, and its shape favourable to incision, it forms an admirable cutting instrument, but is powerless as a thrusting weapon. The scimitar is not, however, any match for the bayonet.

SCINK, or SKINK (*Scincus officinalis*), a saurian reptile, found in the north of Africa, and in some parts of Asia. It is from six to eight inches long, generally of a reddish-dun colour, with darker transverse bands, a wedge-shaped head, and four pretty strong limbs. It has been in great repute for imaginary medicinal virtues from remote times; it was largely imported on this account into ancient Rome, and is still in high esteem in the East, dried scinks finding a ready sale in many places, as Cairo and Alexandria. There is almost no disease for which it has not been

supposed to be a cure.—The S. belongs to the family *Scincidae*, which is interesting as one of the connecting links between saurians and serpents. The S. itself is in general appearance quite snake-like; but in some of the allied genera, the limbs

Scink (*Scincus officinalis*).

become rudimentary, or nearly so. In some of the pairs is wanting; and even the Slow-worms (*Anguis*) are by many naturalists reckoned as a family, in which the limbs are not manifest externally, although they may be observed on careful dissection. Among the genera in which the four limbs are all externally manifest, although very small and imperfect, is *Seps*, sometimes of the type of a separate family, *Sepsidae*, in which the body is much elongated and snake-like.

SCINTILLATION (Lat. *scintilla*), a term applied to denote the sparkling or flickering of the stars. The phenomenon is not yet quite explained, but it is certainly due to the earth's atmosphere, as proved by the following facts, which embrace nearly all that is known on the subject. If, on a clear evening, we look at a bright star, such as Sirius, we observe that the intensity and colour of its light are constantly changing—from great brilliancy to almost total obscurity, from bright red to fine blue, and on. As it rises above the horizon, these appearances diminish in intensity; and stars near the zenith scarcely scintillate at all. Again, the amount of scintillation depends upon the character of the weather—on some evenings, all large stars appear to scintillate strongly; on others, there is hardly a trace of the appearance. It is commonly said that a planet can be distinguished from a star by the absence of scintillation. This is nearly, but not quite, true; for feeble scintillations have been occasionally observed in Mars and Venus, but rarely in Jupiter and Saturn. One of the reasons for the non-scintillation of planets seems to be their finite apparent size; for all the more conspicuous planets shew a sensible disc even in a poor telescope, while no instrument that has ever been constructed has shewn a real disc in a star. Thus, a small particle or vesicle of vapour may be large enough to conceal a star for an instant, while it could have no such effect on a planet. It is pretty certain that scintillation is not due to unequally heated masses of air, since it usually modifies only the apparent position, of a star. Another cause may be seen in the comparatively feeble light of the planets. It is well ascertained that the scintillation is less when viewed from the top of a mountain. For a good idea of what is known, and what is desired still to know, on this subject, see a paper by Professor Dufour, *Philosophical Magazine*, 1860.

SCIO, one of the most beautiful islands in the Aegean Sea, belongs to Turkey, and lies south-west

off the coast of Asia Minor, at the entrance to the Gulf of Smyrna. It is 32 miles long, and 18 miles in greatest breadth. Area, 400 sq. m.; pop. about 8,000. It is mountainous in the north, and is extremely fertile. Silk, figs, cheese, wool, and um-mastic are its principal products; and its wine, which was famous in ancient times, is still esteemed. Kastro, the capital, a thriving and handsome town of 18,800 inhabitants, stands on the east coast, has a harbour, a castle, and two light-houses, and carries on a growing trade in fruits, confectionery, and silk and woollen goods.

In early times, S. formed one of the 12 Ionian isles, and it contributed 100 ships to the Greek navy that fought and was defeated by the Persians in the sea-fight of Miletus (494 B.C.). In more recent times, the island was taken by the Genoese in 1346, and in 1566 by the Turks, in whose hands it has since, except for a short interval, remained. It was conferred as private property upon the Sultana, enjoyed her protection, and consequently prospered. After it had enjoyed a long period of ease and wealth, a dreadful calamity fell on the island at the outbreak of the Greekurrection. A number of the Sciotes having, in 1822, joined the Samians, who had revolted, the island was attacked by a Turkish fleet and army, and the inhabitants, enervated by peace and wealth, were indiscriminately massacred; 25,000 fell by the sword, 45,000 were sold as slaves, and 15,000 escaped from the island. Subsequently, however, many of the Sciote families returned, and now the island fast recovering the blow it sustained. Trade is turning; and the vineyards, and the olive, citron, and mastic groves are again flourishing.

SCIOGRAPHY, the drawing of Sections (q. v.) of buildings, so as to shew the interior of them.

SCIOPIUS (Latinised form of *Schoppe*), ALEXANDER, a noted classical scholar and controversialist, was born at Neumark, in the Palatinate, 15th May 1576; studied at Heidelberg, Altdorf, and Ingolstadt; and in 1597, visited Italy, Bohemia, Poland, and Holland. Already he had become celebrated by his Latin verse and his notes upon different Latin authors. Next year, he abjured Protestantism, and became a Roman Catholic, in consequence of which he was decorated by the pope with various titles, and received a pension of 600 rixins, together with a residence in the Vatican. Everforth, his career is a series of fierce onslaughts chiefly on his former co-religionists, but also directed against all whom accident or malice led him to hate. The first person whom he selected for attack was the illustrious Scaliger (q. v.), against whom, in 1607, he launched his *Scaliger Hypobolismus* (Mainz). In this production, Henry IV. was also assailed. Sent in 1608 by the court of Rome to the diet of Ratisbon, for the purpose of serving the religious condition of Germany, he published in the same year more than twenty pamphlets against the Protestants, recommending the Catholic powers to use every means for their extermination. Such sentiments were, of course, highly satisfactory to the emperor of Germany, who was a devoted Catholic; and, in consequence, on visiting Vienna, met with a favourable reception, and was raised to the dignity of count-palatine. In 1611, he fired off two libels against King James I. of England; the first was entitled *Christianus Autorialis Ser. D. Jacobi, Mag. Brit. Regis, Oppositus* (Hartberg); and the second, *Anglicanum Regium*, &c. Some three years after, when staying at Madrid, he was dreadfully beaten by the domestics of Lord Digby, the English ambassador, in retaliation for the abuse of his

sovereign. S. fled from Spain to Ingolstadt, where he issued his *Legatus Latro* against the ambassador. In 1618, S. went to Milan, where he resided for the next twelve years, devoting himself partly to philosophical studies, and partly to theological warfare. He died, 19th November 1649. S. was a prodigious scholar, and might have rivalled Scaliger himself in reputation, as he did in learning, had it not been for the infirmities of his temper and judgment. To this day, his works, especially those on the Latin language, are reckoned valuable. The principal are: *Poemata Varia* (Heidelb. 1593); *Verisimilium Libri Quatuor*, &c. (Nürnberg. 1596); *Suspecta Lectiones* (Nürnberg. 1597); *De Arte Critica* (Nürnberg. 1597); *Symbola Critica in Apuleii Opera* (Augsburg, 1605); *Observationes Linguae Latinae* (Frankf. 1609); *De Rhetoricarum Exercitationum Generibus* (Mil. 1628); *Grammatica Philosophica, sive Institutiones Grammaticae Latinae* (Mil. 1628); *Paradoxa Literaria* (Mil. 1628); *Mercurius Bilinguis*, &c. (Mil. 1628); *Rudimenta Grammaticae Philosophicae* (Mil. 1629); *Astrologia Ecclesiastica* (1634); *De Scholarum et Studiorum Ratione* (Pad. 1636); *Mercurius Quadrilinguis* (Basel, 1637), &c.

SCIO'TO, a river of Ohio, U.S., rises in the high lands of the north-west portion of the state, flows south-east to Columbus, then south to its junction at Portsmouth with the river Ohio. It is 200 miles long, flows through a rich valley, is navigable 130 miles, and for 90 miles feeds the Ohio and Erie Canal. It is crossed by numerous railways.

SCIPIO, PUBLIUS CORNELIUS, surnamed AFRICANUS MAJOR, one of the most accomplished warriors of ancient Rome, but whose reputation is perhaps somewhat greater than his merits, was born 237 or 234 B.C. He is first mentioned as taking part, though only a youth, in the battle of the Ticinus (218 B.C.), where he saved his father's life. Two years later, he fought at Cannæ as a military tribune, and was one of the few Roman officers who escaped from that disastrous field. In 212 B.C., he was elected ædile, though not legally qualified by age, and in the following year, proconsul, with command of the Roman forces in Spain. His appearance there restored fortune to the Roman arms. By a bold and sudden march, he captured *Nova Carthago*, the stronghold of the Carthaginians, and obtained an immense booty. His humane and courteous manners won over many of the native chiefs; and when he commenced the campaign of 209 B.C., his superiority over his opponents in address, if not in generalship, was manifest. At Bæcula, in the valley of the Guadalquivir, he defeated Hasdrubal with heavy loss, but could not prevent him from crossing the Pyrenees to the assistance of Hannibal. In 207 B.C., he won a more decisive victory over the other Hasdrubal, son of Gisico and Mago, at an unknown place called Silpia, or Elinga, somewhere in Andalusia—the effect of which was to place the whole of Spain in the hands of the Romans. Soon after, he returned to Rome, where he was elected consul (205 B.C.), though he had not yet filled the office of prætor; and in the following year he sailed from Lilybæum, in Sicily, at the head of a large army, for the invasion of Africa. His successes compelled the Carthaginian senate to recall Hannibal from Italy. This was the very thing that S. desired, and had laboured to achieve. After some abortive efforts at reconciliation, the great struggle between Rome and Carthage, between S. and Hannibal, was terminated by the battle fought at Naragra, on the Bagradas, near Zama, 19th October 202 B.C., in which the Carthaginian troops were routed with immense slaughter. Hannibal advised his countrymen

to abandon what had now become a hopeless and ruinous contest, and his advice was taken. Peace was concluded in the following year, when S. returned to Rome, and enjoyed a triumph. The surname of AFRICANUS was conferred on him; and so extravagant was the popular gratitude, that it was proposed to make him consul and dictator for life, honours that would have been the destruction of the constitution, but which S. was either wise enough or magnanimous enough to refuse. When his brother, Lucius, in 190, obtained the command of the army destined to invade the territories of Antiochus, S. served under him as legate; in fact, it was only when he offered to do so, that the senate granted Lusius the province of Greece. The latter was victorious in the war, and on his return to Rome (189 B.C.), assumed (in imitation of his brother) the surname of ASIATICUS. But the clouds were now gathering heavily round the Scipios. In 187 B.C., Cato Major and others induced two tribunes to prosecute Lucius for allowing himself to be bribed by Antiochus in the late war. He was declared guilty by the senate; his property was confiscated; and he himself would have been thrown into prison, had not his brother forcibly rescued him from the hands of the officers of justice. In 185 B.C., S. himself was accused by the tribune, M. Æmilius; but instead of refuting the charges brought against him (and which were probably groundless), he delivered, on the first day of his trial, a eulogy on his own achievements, and opened the second day by reminding the citizens that it was the anniversary of the battle of Zama, and therefore not a time for angry squabbling, but for religious services. He then summoned the people to follow him to the Capitol, to give thanks to the immortal gods, to pray that Rome might never want citizens like himself. His audience were electrified, and the thing was done before opposition became possible. To resume the trial, was out of the question; but S. felt that popular enthusiasm was not to be depended on; that the power of the oligarchy—of that compact body of ambitious and exclusive nobles—was irresistible; that its hatred of him was unappeasable, and that his day was over. He retired to his country-seat at Liternum, in Campania, where he spent the remainder of his life, and where he died, 183 or 185 B.C.—S. is commonly regarded as the greatest Roman general before Julius Cæsar; and certainly, in the brilliancy of his gifts and accomplishments, he was unsurpassed; but if his career be strictly criticised, it will be found that he owed as much to fortune as to genius. Nevertheless, he won a multitude of splendid successes, and made the most of his great advantages. His beauty, bravery, and courtesy; his proud, yet pious belief that the gods favoured him with their inspiration, won him the love and reverence of soldiers and women; and his magnanimity towards his fallen rival, who flitted about the eastern courts in dreary exile, is a bright feature in his character, and nobly distinguishes him from the cruel-hearted oligarchs of the senate.

SCIPIO ÆMILIANUS, PUBLIUS CORNELIUS, surnamed AFRICANUS MINOR, born 185 B.C., was a younger son of Lucius Æmilius Paulus, who conquered Macedon, but was adopted by his kinsman, Publius Scipio, son of the great Scipio, who had married the daughter of that Lucius Æmilius Paulus who fell at Cannæ. S. accompanied his father on his expedition against Macedon, and fought at the decisive battle of Pydna, 168 B.C. In Greece, he made the acquaintance of Polybius the historian, who afterwards became one of his closest and most valued friends. In 151 B.C., he went to Spain as military tribune, in the wake of the consul

Lucius Lucullus, where he distinguished himself alike by his valour and his virtue. Two years later began the third and last Punic war, which mainly consisted in the siege of Carthage. S. still held the subordinate position of military tribune; but the incapacity of the consuls, Manius Manilius and Lucius Calpurnius Piso, and the brilliant manner in which he rectified their blunders, fixed all eyes upon him. The favourite both of the Roman army and the Roman people, S. was at length, in 147, elected when only a candidate for the ædileship, elected consul by an extraordinary decree of the Comitia, and invested with supreme command; old Cato, who could with difficulty be got to praise anyone, applying to the young hero and his intimate comrades (according to Plutarch) the Homeric line—

He only is a living man; the rest are fitting shades.

The story of the siege of Carthage, the desperate heroism of its inhabitants, the determined resolution, the sleepless vigilance, the incessant labour of S., are too well known to require description. Suffice it to say, that after a protracted defence of months, the city was finally taken by storm in the spring of 146 B.C.; and by the orders of the senate, it was levelled to the ground, and the plough was driven over its site. S., a man of noble and generous soul, obeyed the savage behest with sorrow, and with horror. As he gazed on the ruin he had wrought, the thought flashed across his mind that some day Rome too might perish, and the words of the *Iliad* rose to his lips—

The day shall come when sacred Troy shall perish
And Priam and his people shall be slain.

S., though probably the most accomplished and gentleman of his age, was rigorous in his observance of the antique Roman virtues; and in holding the office of censor in 142 B.C., he strove to follow in the footsteps of Cato. But his efforts to repress the increasing luxury and immorality of the capital were frustrated by the opposition of his colleague, Lucius Mummius, the rough conqueror of Corinth. In 139 B.C., S. was accused of the *crimen majestatis* by the tribune Tiberius Claudius Asellus, but was acquitted, and soon afterwards was sent to Egypt and Asia on a special embassy. Meanwhile, however, affairs had gone badly in Spain. Viriathus, the Lusitanian patriot, had not only again inflicted the most disgraceful defeat on the Roman armies, and his example had revived the hopes of the Celtiberian tribes, who also rose to war against the common foe. The contest continued with varying success; but the interest in the city of Numantia, whose inhabitants played amazing courage in the struggle with him. For long it seemed as if the Numantines were invincible—one consul after another finding subjugation too hard a task—but at length, in 133 B.C., S., re-elected consul, was sent over to Spain, and after a siege of eight months, forced the city, who were dying of hunger, to surrender, and destroyed their homes. He then returned to Rome, where he took a prominent part in political affairs, appearing as the leader of the aristocratic party, the consequence of which his popularity with the democratic party greatly declined. Although a brother-in-law of Tiberius Gracchus, whose sister, Cornelia, he had married, he rather disclaimed sympathy with his political aims; and when he heard of the murder of his kinsman, quoted his favourite Homer: 'So perish all who do this again.' His attempt (129 B.C.) to rescind a portion of the agrarian law of Tiberius Gracchus relating to the lands of the *Socii*, excited the furious indignation. When he went home

the senate, he had to be accompanied by a guard. Next morning, he was found dead in his bed; the prevailing suspicion being, that he was murdered either by or at the instigation of Papirius Carbo, his most rancorous political enemy. S. was neither a rigid aristocrat nor a flatterer of the people. Inferior in splendour of genius to his adoptive grandfather, he surpassed him in purity of character, in simplicity of patriotism, and in liberality of culture.

SCIRPUS, a genus of plants of the natural order *Juncaceæ*. The English name Club-rush is sometimes given to them. The Common Bulrush (q. v.) is a familiar example. There are several British species, some of them very small in comparison with the Bulrush, as *S. cespitosus*, called *Deer's Hair* in the Highlands of Scotland, which is only two or three inches high, and abounds in moors, affording food to sheep in spring. The root-stocks of *S. ubius* are eaten by the natives of the south of India; as are the tubers of *S. tuberosus*, which is called *Pi-tai* by the Chinese, and is cultivated by them in tanks and ponds, copious supplies of manure being given. The tubers are roundish.

SCIRRHUS (Gr. hard), a term applied to a kind of Cancer (q. v.).

SCITAMINEÆ, or ZINGIBERACEÆ, a natural order of endogenous plants, herbaceous perennials. There are about 250 known species, among which are the different kinds of Ginger, Galangale, Salsary, Cardamom, Grains of Paradise, Turmeric, &c. Most of them are notable for their aromatic properties, which reside chiefly in their root-stocks in their seeds. The root-stocks of some, particularly when young, contain much starch, which is used as arrow-root. All the species are tropical or subtropical.

SCIURIDÆ. See SQUIRREL.

SCLERODERMII, Cuvier's name for the family fishes called *Balistidae* by Müller. See BALISTES.

SCLEROGENIDÆ. See MAILED CHEEKS.

SCLEROSTOMA (from the Gr. *scleros*, hard, and *stoma*, the mouth) is the term applied to a well-known genus of the family of *Strongylidæ*, belonging to the order of round worms or Nematoda (q. v.). One species, the *Sclerostoma syngamus*, is of

special interest, as being the cause of the disease in poultry known as the Gapes (q. v.). Since the article GAPES was published, it has been ascertained that the entozoon which infests the windpipe of the diseased birds is not a trematoid (or fluke-like) worm, but a round worm, possessing many very singular properties. Dr Cobbold, to whom we are mainly indebted for our knowledge of this worm, removed from a chloroformed fowl with the gapes, seven sclerostomata. 'Six of these parasites

Fig. 1.—*Sclerostoma syngamus*.
1, Male and female—natural size;
2, upper part of the same, enlarged (from Cobbold). The male is the smaller worm on the right side of these figures.

were united in pairs, the odd worm being a female, from which the male had in all likelihood been rudely torn during the withdrawal of the forceps' (*Entozoa*,

1864, p. 86). The females thus extracted had an average length of $\frac{1}{4}$ th of an inch; while the males scarcely exceeded $\frac{1}{8}$ th of an inch. In both sexes, the breadth of the body was nearly uniform throughout, being about $\frac{1}{16}$ th of an inch in the female, and only $\frac{1}{32}$ th of an inch in the male. The mouth of the female is furnished with six prominent chitinous lips. According to Siebold, after sexual congress, 'there is ultimately a lasting continuity of the sexes by means of an actual growing together'—one of the most remarkable facts ever recorded in natural history. Hence the eggs, which are comparatively large, and many of which contain fully formed embryos, can only escape by a breaking-up of the body of the parent. 'By whatever mode,' says Dr Cobbold, 'the young make their exit from the shell, it is manifest, that prior to their expulsion, they are sufficiently developed to undertake an active migration. Their next habitation may occur within the bodies of certain insect larvæ, or even in small land molluscs; but I think it more likely that they either enter the substance of vegetable matters, or bury themselves in the soil at a short distance from the surface.'

Considering that this worm infests the trachea of the domestic fowl, the turkey, the pheasant, and the partridge, as well as of many birds of less importance (as the magpie, the black stork, the starling, the swift, &c.), it is of the greatest importance to

Fig. 2.—*Sclerostoma duodenale*—Male specimen.

1, The natural size; 2, the same magnified, and seen laterally;
a, generative organ; b, region of anus.

check its development. With this view, the worms must not only be removed by the means described in the article GAPES, and more fully in Cobbold's *Entozoa*, pp. 90, 91, but they must be *totally destroyed* after their removal. If they be merely killed, and thrown on the ground, the mature eggs will probably remain uninjured; and when decomposition sets in, the young embryos will, sooner or later, escape from the shells, migrate in the soil or elsewhere, and ultimately find their way—how, we cannot tell—into the air-passages of certain birds, in the same manner as their parents did before them.

Dr Cobbold, whose classification of intestinal worms will doubtless for many years be the standard one, places the *Dochmius anchylostomum*, or *Anchylostoma duodenale* (see *STRONGYLIDÆ*), in this genus, with the name of *Sclerostoma duodenale*. This worm, which usually measures about $\frac{1}{4}$ of an inch in length, is especially characterised by an asymmetrical disposition of four horny, conical, oval papillæ, of unequal size, forming the so-called teeth. The female is larger than the male in about the ratio of

4 to 3, and is the more numerous in the ratio of 3 to 1. This worm was first discovered by Dubini at Milan in 1838, and though at first thought rare, is now known to be tolerably common throughout Northern Italy. It is remarkably abundant in Egypt, where Pruner found it in nearly every corpse, sometimes, in hundreds of specimens, in the jejunum, and to a less extent in the duodenum. Griesinger, in his *Memoir On the Frequency of Entozoa in Egypt, and the Diseases they occasion* (1854), considers that about one-fourth of the population are constantly suffering from a severe anæmic chlorosis, occasioned solely by the presence of this parasite. A tolerably full account of this disorder, and of the treatment to be adopted, is given by Küchenmeister in his *Manual of Parasites*, vol. i. pp. 386—389.

SCLEROTIUM, a spurious genus of fungi, now regarded as merely the mycelium of fungi, and these probably of very different kinds, which have been arrested in their development, assuming a peculiar form. This form is that of a fleshy mass, often a ball. Examples are to be found among almost all kinds of decaying vegetable matter, as fruits, esculent roots, &c. When a crop of onions rots off, as is often the case, to the vexation of the gardener, a S. will generally be found attached to the bulbs in the form of little irregular black masses, or as a multitude of small granules. On the under side of decaying cabbage-leaves, and scattered on the ground beneath the plant to which they belong, may in like manner be seen little balls, varying from white or reddish-brown to dark brown and black, in size about equal to cabbage-seeds, whence stories of showers of seeds have sometimes originated.

SCO'LEX. See TAPE-WORMS.

SCOLOPA'CIDÆ, a family of birds of the order *Grallæ*, having a long, feeble, soft, and somewhat flexible bill, which is remarkably furnished with nerves, particularly towards the tip, so as to be extremely sensitive, whilst many of them have also a peculiar muscle, enabling them to separate the points of the mandibles the moment that their prey is felt. They are thus admirably fitted for seeking their food—which generally consists of worms, slugs, &c.—in mud, soft earth, or wet sand. The membrane of the tip of the bill is almost pulpy in many of them. The species are numerous, and very widely distributed, generally inhabitants of swampy or very moist places. Snipes, woodcocks, sandpipers, and curlews are familiar examples.

SCOLOPE'NDRA. See CENTIPEDE.

SCOLOPE'NDRIUM. See HART'S TONGUE.

SCOLYTUS, a genus of coleopterous insects of the family *Xylophagi*. See BARK-BEETLE. One

Scolytus destructor, and Section of Wood, shewing the burrows of the larvæ.

species, *S. destructor*, a beetle only about one-sixth of an inch in length, of a dull colour, with short

antennæ, thickened at the extremity, has of late years destroyed great numbers of fine elms in the neighbourhood of London and elsewhere in England. The female insect burrows in the wood, and lays a row of eggs; the larvæ, as soon as they are hatched, begin to feed upon the wood, and eat their way in long tunnels, diverging on all sides from the original one. This pest appears to be spreading in England.

SCOMBERESOCIDÆ, a family of fishes, of the order *Plectognathi*, having the maxillary bone united with the elongated premaxillaries at the corners of the mouth. The Flying-fish (*Exocoetidae*) belongs to this family. The Gar-fish and the Pike are the only species common on the British coasts. Until the *Plectognathi* were recognised as a separate order, the S. were reckoned as belonging to the *Esocidae*, or pike family.

SCOMBERIDÆ, or **SCOMBRIDÆ**, a large family of acanthopterous fishes, containing many species highly esteemed as articles of food, and some of them of great value on account of the abundance in which they are caught. Some of them attain a large size. They have a smooth body, covered generally with small scales, and often very beautifully coloured; the tail-fin generally large, and the tail very muscular and powerful. The gill-covers have no armature. The sides of the tail are deeply keeled and armed with sharp-keeled scales. The front spines of the anal fin are generally detached, and sometimes those of the first dorsal fin. The second dorsal fin is often represented by numerous finlets, as in the Mackerel (q. v.). To the same tribe with the mackerel, characterised by finlets and by the want of armature on the lateral line, belong the Bonito (q. v.), the Tunny (q. v.), the Albacore (see TUNNY), and the Seirfish (q. v.). The importance of the Mackerel fishery is well known; also that of the Tunny fishery of the Mediterranean. The Sword-fish (q. v.) is an example of another group, comprising only a few species, having no finlets, and remarkably characterised by the dagger-like prolongation of the muzzle. The Pilchard (q. v.) belongs to a tribe having the first dorsal represented by isolated spines. There are other tribes or groups, some having the lateral line cuirassed, some not having this armature, and some having finlets nor detached spines. The Herring (q. v.) and allied genera, often regarded as forming a tribe of S., have been constituted into a distinct family, *Zeidae*.—The S. are all marine. They are more numerous in warm than in cold climates, although some are found in very northern seas, in which the mackerel is the most important instance. It and the Scad (q. v.), or Horse Mackerel, are the only species common on the British coasts, although several others are known as of rare occurrence.

SCONCE, in Fortification, is a term applied to any small redoubt or fort, detached from the main works for some local object, as the defence of a pass or ford, &c. The word is not now often used.

SCONCE, a candlestick affixed to a wall by a bracket, and frequently with a mirror or other reflector.

SCONE (pronounced *Scoon*), a parish in Perthshire, lying on the left bank of the Tay, about two miles from Perth. It is famous as the seat of one of the most venerable of Scottish abbeys. S. is first mentioned in the beginning of the 12th c., when a council was held there in the 6th year of the reign of King Constantine, at which time it is styled, by the Chronicle which records the fact, *regalis civitas*, the royal city. A monastery was built at S. probably about the same period, and there was located the famous stone on which the kings of the Scots were inaugurated.

which was carried by Edward I. of England to Westminster Abbey. In place of the ancient monastery, an abbey of Canons Regular was founded by Alexander I., in 1115, and there the sovereigns continued to be inaugurated and crowned. Alexander III., the last of the ancient race of kings, and Robert Bruce, the founder of the new dynasty, were crowned at S.; but after the accession of the House of Stuart, the coronation sometimes took place in other churches. In the summer of 1559, when Perth was held by the Lords of the Congregation, a disorderly multitude of their adherents assaulted the monastery of S., set it on fire, and left it a slackened ruin. The last coronation which was celebrated at S. was that of Charles II., on the 1st of January 1651. The abbey-church had never been restored, and the solemnity took place in the parish kirk, the crown being placed on the king's head by the Marquis of Argyll. In January 1716, the Jacobite leaders endeavoured to encourage their followers by fixing a day for the coronation of the Chevalier at S., but the design was abandoned. In the reign of James VI., the abbey of S. was erected into a temporal lordship in favour of Sir David Murray, afterwards created Viscount of Stormont. The great chief-justice, the Earl of Mansfield, a younger son of the fifth Viscount Stormont, was born at S.; and the Scottish peerage is now merged in the British earldom. The Viscounts of Stormont had a residence near the site of the abbey, and hence known as the Palace of Scone. The present palace was erected on the same site in the beginning of this century.

SCO'PAS, a celebrated Greek sculptor and architect, belonging to the later Attic school, the head of which was Praxiteles (q. v.), was born in the island of Paros, and flourished during the first half of the 4th c. B. C. Nothing is known regarding his life or the period of his death. His principal architectural works are: 'The Temple of Athena Alla at Tegea,' the first both in point of size and beauty in the Peloponnesus; 'The (second) Temple of Diana at Ephesus' (though Deinocrates is also and even more generally named as the architect of his building); some of the bas-reliefs in the famous Mausoleum erected by Artemisia, queen of Caria, in memory of her husband (and now in the British Museum). His sculptures, by which we mean his single statues and groups illustrating the divinities of Greek mythology, were very numerous, and for the most part were executed in marble. They embrace subjects from the myths of Aphrodite (Venus), Dionysus (Bacchus), Apollo, Artemis (Diana), &c. But perhaps the noblest, and certainly the most famous piece of sculpture executed by S., was that which latterly stood in the Flaminian Circus at Rome, and represented Achilles conducted to the island of Leuce by the divinities of the sea. It included statues of Neptune, Thetis, the Nereids, Tritons, and a variety of sea-monsters, and according to Pliny, the whole was so beautiful, that it would have been sufficient to have immortalised S., even if he had done nothing more.

SCOPELIDÆ. See SALMONIDÆ.

SCORE, in Music, compositions for several voices or instruments, or for an orchestra, so written, that each part has a separate staff for itself, these staves being placed over each other, bar corresponding to bar. It is so called because the bars are *scored* or drawn through all the parts from top to bottom. Occasionally, where there is a deficiency of staves for all the parts, or where any of the parts have so little to do that it is not worth while to assign them a separate staff, parts related to or connected with each other, as two flutes, two clarionets, or three

trombones, may be written on the same staff together. The arrangement or distribution of the parts in a score is matter of some importance. As a general rule, the highest part should be placed uppermost, then the next lower, and gradually descending. All the parts of a chorus should be placed together. Perfection in reading score is not very easily attained, but is necessary for a thoroughly trained musician. The student of music who can read or play the great master-works from the score, will become far more intimately acquainted with them than he could by mere piano-forte arrangements, and will come to understand the means by which their composers have produced the wonderful effects that are to be found in their music. The use of so large a number of clefs, and the practice which has obtained of writing parts for particular instruments in other keys, have added greatly to the difficulty of studying the score. Among various suggestions for simplifying the score, one which was lately advocated in Brown's *Elements of Musical Science*, consists in the use of but one clef, the bass or F clef, the other parts being distinguished from the bass by short bars attached to the clef, which direct the performer to take the notes one, two, or three octaves higher.

SCORESBY, WILLIAM, D.D., a celebrated Arctic explorer and savant, was the son of William Scoresby, the most distinguished whale-fisher of his time, and was born at Cropton in Yorkshire, October 5, 1789. He commenced a seafaring life at the age of ten; and in his 21st year succeeded his father as commander of the *Resolution*, and carried on the business of whale-fishing. After having made 17 voyages to the Spitzbergen and Greenland whaling-grounds, he published the results of his observations of the countries within the Arctic Circle in *An Account of the Arctic Regions* (2 vols., 1820), a work which not only increased and extended the author's reputation, but added largely to the sciences of meteorology, hydrography, and natural history. In 1822, he explored the east coast of Greenland, a tract hitherto wholly unknown, and published in the following year at Edinburgh an account of this expedition and its fruits. In 1824, he was elected a Fellow of the Royal Society of London, and some time after was chosen *correspondant* of the French Institute. He had retired from his profession in 1822, and now proceeded to give effect to a strong desire which had long possessed him, of becoming an authorised teacher of religion, by entering himself at Queen's College, Cambridge; he graduated as B.D. in 1834, subsequently (1839) received the degree of D.D., and laboured faithfully and zealously, first at Liverpool and afterwards at Bradford, till failing health compelled him to retire to Torquay. He still continued his physical researches, giving special attention to terrestrial magnetism, especially in its relation to navigation; and published the results, many of which were of great value and interest, in the form of *Memoirs*, in the *Philosophical Transactions*, the *Transactions of the Royal Society of Edinburgh*, the *Reports of the British Association*, and subsequently in an improved form in his *Magnetical Investigations* (Lond. 2 vols. 1839—1852). For the better prosecution of these researches, he made a voyage to the United States in 1847, and to Australia in 1853, returning from the last-named country in 1856, enfeebled in health by the arduous labours which he had undergone. He died at Torquay on March 21, 1857. Besides his work on *Zoetic Magnetism*, which described a series of researches entered into for the purpose of eliciting some natural connection between magnetic and mesmeric agencies, he published various works of a religious nature.

SCORPÆ—SCOTCH STATUTES.

His life has been written by his nephew, R. E. Scoresby-Jackson (Lond. 1861).

SCORPÆ are the cinders and slags of volcanoes, more or less porous from the expansion of the gases contained in the melted materials. See VOLCANIC ROCKS.

SCORPÆNA, a genus of fishes, of the family of *Mailed Cheeks*. The head is large and compressed, more or less armed with spines or tubercles. The body is of a somewhat perch-like form. Some of the *Scorpenæ* are remarkable for their ugliness; some exhibit very fine colours. They are numerous in the Mediterranean, and widely distributed in the seas of warm climates. They frequent rocky shores in shoals, and feed on crustaceans, small fishes, &c. They are popularly called *Hog-fish* and *Scorpion-fish*. The flesh is dry and tasteless, but the liver yields a useful oil.—The Bergylt (q. v.) belongs to a nearly allied genus.

SCORPION (*Scorpio*), a genus of *Arachnida*, of the order *Pulmonaria*, formerly including the whole of the family *Scorpionidæ*, to all of which the popular name is still extended. Scorpions are natives of warm climates, both in the eastern and western hemispheres. The species are numerous. They have the body elongated, and no marked division between the thorax and abdomen. Six segments of the abdomen are broad; but the last six are narrow, forming a tail; and the last segment is modified into a curved and sharp sting, having two pores on its lower side, from which the venom flows, supplied by two poison glands in the base of the segment. The palpi are modified into pincers or claws like those of the lobster, by means of which prey is seized. There are four spiracles or breathing pores on each side of the abdomen. There are two remarkable comb-like appendages on the under surface of the thorax, the use of which is unknown. The number of eyes is various; in the restricted genus *Scorpio*, of which the COMMON S. (*S. Europæus*) of the south of Europe is an example, there are only

Scorpion (*Scorpio Europæus*).

six; but in some of the genera eight and twelve. Scorpions feed on beetles and other insects, and after seizing them, pierce them with the sting before eating them. They also eat the eggs of spiders, &c. They lurk under stones and in holes and crevices, but come forth to seek their prey, running with great activity. In running, they carry the tail curled over the back. When alarmed or irritated, they shew great fierceness, evidently aware of the power of their sting, and moving it in all directions, as if threatening an adversary. They are universally disliked, and not a little dreaded, being apt to get into houses, and into beds, hiding themselves under pillows, in shoes, boots, &c., so that accidents are very frequent in countries where they abound. The sting of a S. is seldom fatal, but even that of the Common European S. is very painful, and that of some of the largest species—which are six inches long—is much more severe, attended with much nausea and constitutional derangement, nor do the

effects soon cease. It is of use to press a large key or other tube on the wound, so as to force out part of the poison. The best remedy is ammonia internally administered, and also applied externally.

The female S. displays great regard for her young, which she carries for some time clinging in great numbers to her back, limbs, and tail.

SCORZONEA, a genus of plants of the natural order *Compositæ*, suborder *Cichoraceæ*, having yellow or rarely rose-coloured flowers. The species are numerous, mostly natives of the south of Europe and the East. No species is found in Britain. The Common S. of our kitchen-gardens, *S. Hipocistis*, a native of the south of Europe, has long been cultivated for its esculent roots. The root is black externally, white within, about the thickness of a man's finger, long, and tapering very gradually, whence the name *Viper's Grass*, sometimes given to the plant, the root being supposed to resemble a viper. It contains a white milky juice, and has a mild sweetish mucilaginous taste; it is very pleasant when boiled, the outer rind being first scraped off, and the root steeped in water, to abstract part of its bitterness. The leaves are an inferior substitute for mulberry leaves in feeding silkworms.—Other species of S. are used in the same way.

SCOT, REGINALD, a writer who has acquired an honourable reputation as an early disbeliever in the reality of witchcraft, was a younger son of Sir John Scot of Scotshall, near Smeeth in the county of Kent, and was born in the first half of the 18th century. He studied at Oxford, and on his return home devoted himself exclusively to learned pursuits. Nothing further is known regarding him except that he died in 1599. His famous work, entitled *The Discoverie of Witchcraft*, was published in 1584, and is designed to demonstrate the absurdity of the prevalent belief on the subject. It is full of learning, and is marked in many passages by common sense and humane feeling, qualities that naturally excited the antipathy of a person like King James, who wrote his *Demonology*, as he tells us, 'chiefly against the damnable opinions of Wierus and Scot; the latter of whom is not ashamed to print in public print to deny there can be such a thing as witchcraft.' But the 'British Solomon' never reflected the general ignorance and superstition of his age, and S. had to run the gantlet of a series of 'Answers' and 'Refutations' by a number of 'eminent' divines, as well as by Glanvil, the author of the *Scepsis Scientifica*. S.'s book was ordered to be burned by the common hangman, and copies of it are now extremely rare. Besides *The Discoverie of Witchcraft*, S. wrote *A Perfect Platform of a Garden*.

SCOTCH STATUTES frequently mean the ancient acts of parliament beginning with the reign of James I. of Scotland, and continuing down to the Union of England and Scotland. There are also many statutes passed since that date which are applicable exclusively to Scotland, and these are to be found among the statutes at large. The rules of construction of Scotch statutes do not differ from those affecting English or British statutes. One peculiarity, however, distinguishes the old Scotch statutes prior to the Union, which is this, that those statutes lost their force by desuetude, that is, by mere lapse of time, coupled with neglect or non-observance, or at least with a contrary usage. In England, on the other hand, a statute, however ancient and however little acted upon, continues law until it is expressly or by strong implication, repealed by some subsequent statute. Acts of Sederunt—that is, rules of practice passed by the Court of Session—are also subject to the law of desuetude.

SCOTER (*Oidemia*), a genus of the oceanic section of ducks, having a short broad bill with an elevated knob at the base of the upper mandible, the tip much flattened, and terminated by a large nail, the mandibles laminated with broad strongly separated plates; the wings of moderate length; the tail short and acute; the feet very large; the plumage generally very dark. Their food consists chiefly of marine shell-fish, crustaceans, &c. They obtain their food by diving.—The common S., or BLACK S. (*O. nigra*), is about the size of the common duck. The whole plumage of the male is deep black; the bill and legs are also black, except a line of orange along the ridge of the upper mandible. The female is dark brown. The black is abundant in winter on many parts of the British coast, migrating to more northern regions in spring. The flesh is oily, and has a fishy taste; but being therefore permitted to Roman Catholics during Lent, is in great request in some countries, so that at Marseille, Aix, and other places in the south of France, arrangements are made by the magistrates

Velvet Sooter (*Oidemia fusca*).

for an annual shooting or *battue* of scoters, and great numbers are killed.—The VELVET SCOTER (*O. fusca*) is a less common winter visitant of Britain, plentiful only in Orkney.

SCOTIA. See MOULDING.

SCOTLAND. For the Geography, see GREAT BRITAIN. *History.*—An account has been given under the article Picts (q. v.) of the early inhabitants of the country which has long been known by the name of Scotland. The original Scotia or Scythia was Ireland, and the Scoti or Scots, at their first appearance in authentic history, were the people of Ireland. The Scots were a Celtic race, and their original seat in Northern Britain was in Argyle, which they acquired by colonisation or conquest, before the end of the 5th c., and from whence they spread themselves along the western coast from the Firth of Clyde to the modern Ross. The name of S. seems first to have been given to the united kingdom of the Picts and Scots about the 10th century. It was then sometimes styled, by way of distinction, *Scotia Nova* (New Scotland), and it was a considerable time afterwards before the name of S. was applied to it, to the exclusion of Ireland. This interchange of names was a fruitful source of dispute between Irish and Scottish writers in the 16th and following centuries, and it can hardly be said that even now the controversy is entirely at an end.

The first prince of the British Scots mentioned in our authentic annals was Fergus, son of Erc, who

crossed over to Britain about the year 503. His nation had been converted to Christianity by St Patrick, and Fergus himself is said to have received the blessing of the saint in his early years. His great-grandson, Conal, was king of the British Scots when Columba (q. v.) began the conversion of the Northern Picts; and by that prince, according to the best authorities, Iona was given for the use of the mission. Conal was succeeded by his nephew, Aidan, who was inaugurated as sovereign by St Columba in the island of Iona—a ceremony which Scottish writers, misled by the great French antiquary Martene, long believed to be the first example of the benediction of kings. Aidan was a powerful prince, and more than once successfully invaded the English border, but towards the end of his reign he received a severe defeat from the Northumbrian sovereign Ethelfrid at the battle of Degsestan.

The history of Aidan's successors is obscure and uninteresting, except to the professed students of our early history. Their kingdom was overshadowed by the more powerful monarchy of the Picts, with which, as well as with its neighbours in the south—the Britons of Cumbria—it was engaged in almost unceasing conflict. The Scots were for a time under some sort of subjection to the English of Northumbria, but recovered their independence on the defeat and death of King Egfrid in battle with the Picts at Nechtansmere in 685. In the middle of the 9th c., by a revolution, the exact nature of which has never been ascertained, the Scots acquired a predominance in Northern Britain. Kenneth, son of Alpin, the lineal descendant of Fergus and Aidan, succeeded his father as king of the Scots in 836. The Pictish kingdom was weakened by civil dissension and a disputed claim to the crown. Kenneth laid claim to it as the true heir in the female line, and was acknowledged king in the year 843.

King Kenneth transferred his residence to Forteviot in Strathern, which had been the Pictish capital, fixing soon afterwards the ecclesiastical metropolis of the united kingdom at Dunkeld, where he built a church, dedicated to St Columba. The Picts and Scots, each speaking a dialect of the Celtic tongue, gradually coalesced into one people, whose territory extended from the Firths of Forth and Clyde to the northern extremity of Britain. The crown descended to a line of princes of the family of Kenneth, whose rule gave a unity and comparative tranquillity to the Scots of Britain, which those of Ireland, at no time really united under one prince, never possessed, and the good effects of which, as contrasted with the state of the sister island, are experienced to the present day. The first interruption to the descent of the crown in the line of Kenneth was the reign of a usurper named Grig, round whose name, amplified to Gregory by the writers of a later age, a cloud of legendary fiction gathered. The old family was restored on his expulsion in 893.

The reign of Constantine, son of Aodh, who succeeded in 904, was a remarkable one. In his time, it is probable that the seat of the ecclesiastical primacy was transferred from Dunkeld to St Andrews, and that the regal residence was fixed at Scone. At the latter place, in the sixth year of his reign, the chronicles mention that Constantine, the king, Kellach, the bishop, and the Scots, swore to observe the laws and discipline of the faith and the rights of the churches and the gospels. This seems to indicate the meeting of some sort of council, civil or ecclesiastical, or more probably a combination of both, according to the form prevalent at this period both among the Celtic and the Teutonic nations. Even before the establishment of the kingdom of the Picts and Scots in the person of Kenneth,

Northern Britain had experienced the attacks of a new enemy, the Scandinavian invaders, generally spoken of under the name of Danes. Constantine resisted them bravely, but towards the end of his reign he entered into an alliance with them in opposition to the English. A powerful army, composed of Scots and Picts, Britons and Danes, disembarked on the Humber, and was encountered at Brunanburgh by Athelstane, king of England. A battle was fought there, the first of a series of unfortunate combats by Scottish princes on English ground. The confederate army was defeated, and though Constantine escaped, his son was among the slain. Weary of strife, the king soon afterwards retired to the Culdee monastery at St Andrews, of which he became abbot, and where he died in 953.

During the reign of Malcolm the first of that name, and the successor of Constantine, a portion of the Cumbrian kingdom, including the modern Cumberland and part of Westmoreland, which had been wrested from the Britons by Edmund, king of England, was bestowed by that prince on the Scottish sovereign. This grant was the foundation of that claim of homage made by the English kings on the Scottish sovereigns, which afterwards became the cause or the pretext for the great struggle between the two nations. The northern kingdom was still further increased in the reign of Kenneth, son of Malcolm, by the acquisition of Lothian, and of Northern Cumbria, or Strathclyde. The former province, formerly a part of the Northumbrian kingdom, and entirely English in its population, was bestowed on Kenneth by Edgar, king of England. The Cumbrian kingdom, which had at one time extended along the west coast from the Firth of Clyde to the border of Wales, had been weakened by the loss of its southern territories; and it now fell under the dominion of the Scottish king. The last addition to Scotland in the south took place under Malcolm II., son of Kenneth, who acquired the Merse and Teviotdale from the Earl of Northumbria, and thus advanced his kingdom on the eastern border to the Tweed. The reign of Malcolm II. extended from 1033 to 1033. The kings who immediately followed are better known to the general readers than any of their predecessors, poetry having made their names familiar to every one. Malcolm's successor was his grandson, Duncan, whose brief reign was followed by that of Macbeth (q. v.). The latter was a vigorous and prudent ruler, munificent to the church, and famous as the only Scottish king who made a pilgrimage to Rome. But although by marriage he was connected with the royal line, he was unable to secure the affection of his subjects. Malcolm, the eldest son of Duncan, assisted by his kinsman, Siward, Earl of Northumbria, invaded Scotland. The usurper was defeated and slain at Lumphanan, in Mar, in 1056, and Malcolm was acknowledged as king.

The long reign of Malcolm III. was the commencement of a great social and political revolution in Scotland. His residence in England, and still more his marriage with the English Princess Margaret, the sister of Edgar Atheling, led to the introduction of English customs, the English language, and an English population into the northern and western districts of the kingdom, which hitherto had been for the most part inhabited by a Celtic race. The influx of English colonists was increased by the tyranny of William the Conqueror and his Norman followers. All received a ready welcome from the Scottish king, whose object it was to assimilate the condition of the Scots in every respect to that of their fellow-subjects in Lothian; and what his stern, though generous, character might have failed to accomplish, was brought about by

the winning gentleness and Christian graces of the English queen.

Malcolm fell in battle before Alnwick Castle in the year 1093, and Margaret survived only a few days. On this event, it seemed as if the work of their reign was about to be utterly overthrown. The Celtic people of Scotland, attached to their customs, and disregarding the claims of Malcolm's children, raised his brother, Donald Bane, to the throne. The success, however, of this attempt to restore a barbarism which the better part of the nation had outgrown, was of brief duration; Donald was dethroned, and Edgar, the eldest surviving son of Malcolm and Margaret, was acknowledged king. The very name of the new sovereign marked the ascendancy of English influence. That influence, and all the beneficial effects with which it was attended, continued to increase during the reign of Edgar and his brother and successor, Alexander I. The change went steadily on under the wise and beneficent rule of David (q. v.), the youngest son of Malcolm. His reign, which extended from 1124 to 1153, was devoted to the task of ameliorating the condition of his subjects, and never was so much nobly accomplished. David was in every respect the model of a Christian king. Pious, generous, and humane, he was at the same time active and just, conforming himself to the precepts of religion and the rules of the church with the devotion of his mother, but never forgetting that his duty was to his people, not to the clergy, God had committed the government of his kingdom. He was as wise as Alfred was to England, and more than St Lewis to France. Had he reigned over a more populous nation, his name would have been one of the most known among those of the princes of Christendom. As it is, every Scottish scholar has delighted in his character and justice. At the time of his accession, Scotland was still but partially civilized, and it depended in a great measure on the character of its ruler whether it was to advance or to decline. It received a permanent stamp from the government of David. The Celtic people were improved in their manners, socially, and ecclesiastically, and all along the eastern coast were planted Norman, English, and Flemish colonies, which gradually penetrated into the inland districts, and established the language and manners of that Teutonic race which formed the population of the greater part of Scotland. He encouraged and secured the new institutions by introducing a system of written law, which gradually superseded the old Celtic traditionary law. The first genuine collections of Scottish laws belong to his reign. David was as a reformer in the church as in the state. The ecclesiastical system prevalent in Scotland almost at that time differed in some points from that established in England and on the continent, bearing a strong resemblance to that of Ireland, from which it indeed derived. David established dioceses, regulated the erection and endowment of parishes, provided for the maintenance of the clergy, the means of tithes, and displacing the old Celtic monastic bodies, introduced the Benedictine and Augustinian orders.

David, though devoting his energies to the improvement of his subjects in the manner which has been mentioned, did not forget duties of a more agreeable kind. He knew that a Scottish king really held his crown by the tenure of the affections of his people, and none of his fierce ancestors was a more successful warrior than the accomplished and saintly David. His skill and courage were shewn, though not in the same manner as in the case of his predecessors, at the Battle of the Standard. As a representative through his mother of the kings of England, he had many friends and

SCOTLAND.

country; and had the Scottish army been successful, the history of the two kingdoms might in some respects have been different. As it was, he contented himself with maintaining the cause of his sister's child, the Empress Matilda, against King Stephen.

David's grandson and successor, Malcolm IV., reigned for twelve years, and the next king was William the Lion, Malcolm's brother, who ruled from 1165 to 1214. These princes pursued the policy of their grandfather with equal resolution, though sometimes with less success. They were embarrassed by their connection with the English King Henry II., who took advantage of his superior power and ability to impose unwise and unjust restraints on the independence of the Scottish sovereigns and their kingdom—a policy which laid the foundation of the unhappy national strife of after years. This was averted for a time by the concessions of Richard I. in 1189. 'For more than a century,' says Lord Hailes, 'there was no national quarrel, no national war between the two kingdoms—a blessed period.' That period was well employed by the next two kings, Alexander II. and Alexander III., the son and grandson of William the Lion, to consolidate the institutions of their kingdom, and extend and confirm what had been begun by David. Alexander III. was one of the best and best of the Scottish kings. By a treaty with the king of Norway, he added to his kingdom the island and the other islands of the Western Sea, held by the Norwegians. His sudden death, in 1286, was one of the greatest calamities with which Scotland could have been afflicted. It closed a period of prosperity—a course of improvement—which the kingdom did not again enjoy for nearly 500 years. The history of this interesting period has yet to be written. The only modern account of any value is that in the accurate but meagre *Annals of Lord Hailes*. Tytler begins his *History* with the reign of Alexander III.; and Robertson, in his narrative of two reigns—which in popular language is called the *History of Scotland*, just as Lord Macaulay's similar work is called the *History of England*—speaks of what took place during the whole time from the union with the Picts to the death of Alexander III., as 'events which may be slightly touched, but merit no particular or laborious inquiry.'

On the death of the infant grand-daughter and heiress of Alexander III., in 1290, the succession to the crown was disputed. The question between the two chief claimants, Baliol and Bruce (q. v.), was at first free from doubt according to the customs of the time; and Edward I. of England, to whom the decision was referred, appears at first to have acted with good faith. But this great king, who had already subdued Wales, was now bent on uniting the British Islands under one sceptre; and in the pursuit of that object he sacrificed humanity, honour, and justice. The results were most deplorable. The national spirit of the Scots was finally soured, and after a long struggle under Wallace and Bruce they secured their independence on the field of Bannockburn (q. v.). The battle of freedom was won; but it was at the expense of tranquillity and civilisation. The border counties were continually ravaged by the English; the central provinces were the scene of frequent warfare among the chief nobles; and the highland districts became more and more the seat of barbarism, the Celtic tribes reacquiring something of their old ascendancy, just as they did in Ireland in the troubled times which followed the invasion of Edward Bruce. The strong arm of King Robert might have repressed these disorders, had his life been longer spared after the treaty of Northampton; but his death, and the

accession of an infant son, again plunged the country into all the miseries of foreign and civil war. When that son, David II., grew up to manhood, he proved in every respect unworthy of his great father. His reign, and that of his successors Robert II. and Robert III., the two first princes of the House of Stewart, were the most wretched period of Scottish history. In the year 1411, half of the kingdom would have become absolutely barbarous, if the invasion of the Lord of the Isles had not been repulsed at Harlaw (q. v.), by the skill of the Earl of Mar, and the bravery of the lowland knights and burghesses.

A happier time began to dawn on the release of James I., in 1424, from his English captivity. The events of the following period are better known, and a brief notice of the most important will be sufficient. Reference may be made for details to the accounts of the particular kings. The vigorous rule of James I. had restored a tranquillity to which his kingdom had long been unaccustomed; but strife and discord were again brought back on his assassination. One of the most calamitous features of the time, was a succession of minorities in the sovereign. James himself had succeeded when a child and a captive; James II., James III., James IV., James V., Mary, and James VI., all succeeded while under age, and all, except James IV., when little more than infants. The courage and ability shewn by almost all the Stewart princes were insufficient to repair the mischiefs done by others in the beginning of their reigns, and to abate the great curse of the country—the unlimited power and constant feuds of the nobles. The last addition to the Scottish kingdom was made in the reign of James III., when the islands of Orkney and Zetland were made over to him as the dowry of his queen, Margaret of Denmark. The marriage of James IV. with Margaret of England was far more important in its ultimate results, and brought about in the reign of his great-grandson that peaceful union with England which the death of the Maiden of Norway had prevented in the 13th century. Many good laws were enacted during the reigns of the Jameses; but the wisdom of the Scottish legislature was more shewn in framing them than the vigour of the government in enforcing them. Among the most important improvements of the period was the establishment of universities—the first of which, that of St Andrews, was founded during the minority of James I.—and the institution of the College of Justice in the reign of James V.

During the reign of the fifth James, religious discord added another element to the evils with which Scotland was afflicted. The practical corruptions of the church were greater than they were almost in any other country in Europe, and one of the consequences was, that the principles of the Reformation were pushed further than elsewhere. The first great ecclesiastical struggle had hardly ceased, by the overthrow of the Roman Catholic system, when the strife began anew in the Reformed Communion in the shape of a contest between Episcopacy and Presbyterianism, the former being supported by the sovereign, the latter by the common people, the nobles throwing their weight into either scale as it suited their policy at the time. James VI. struggled hard to establish an absolute supremacy, both in church and state, in opposition to a powerful party, which admitted no royal authority whatever in the former, and very little in the latter. After his accession to the English crown, he was apparently successful in carrying out his designs, but during the reign of his son, Charles I., the contest again broke out with increased bitterness. The nobility, whose rapacity

had been checked by the sovereign, joined the popular party. The opponents of the crown bound themselves together, first by the National Covenant, and afterwards in alliance with the English Puritans, by the Solemn League and Covenant. Their efforts were completely successful, but their success led to the utter overthrow of the monarchy by Cromwell.

The restoration of Charles II. was welcomed by all classes, wearied as they were of a foreign and military rule, but especially by the nobles and gentry, who had learned by bitter experience that the humiliation of the sovereign was necessarily followed by the degradation of their order. Had the government of Charles II. and James VII. been reasonably just and moderate, it could hardly have failed in securing general support; but unfortunately it was more oppressive and more corrupt than any which Scotland had experienced since the regencies in the minority of James VI. The natural result was the revolution, which seated William and Mary on the throne.

Hardly had the majority of the nation been successful in this, when many of them began to repent of what they had done, and Jacobitism became more popular than royalist principles had ever been when the House of Stewart was on the throne. The discontent was greatly increased by the fears entertained of English influence. The state of matters grew so threatening after the accession of Queen Anne, that the ruling English statesmen became satisfied that nothing short of an incorporating union between the two kingdoms could avert the danger of a disputed succession to the throne, and of a civil war. Supported by some of the ablest and most influential persons in Scotland, they were successful in carrying through their design, though it was opposed by a majority of the Scottish people. The Act of Union was formally ratified by the parliament of Scotland on the 16th of January 1707. It subsequently received the royal assent, and came into operation on the 1st of May of the same year. The union continued to be unpopular in Scotland for many years, an unpopularity increased by the corrupt means freely used to carry it through. But the discontent gradually ceased, and the ultimate consequences of the measure have been most beneficial to both kingdoms.

A few words may be added regarding the parliament of Scotland. That body was originally composed, like the English parliament, of three classes—the ecclesiastics (consisting of bishops, abbots, and priors), the barons, and the burghesses. The spiritual lords, during the establishment of Episcopacy after the Reformation, were composed of bishops only. When Presbyterianism was established at the time of the Covenant, and when it was formally ratified by law at the Revolution, the ecclesiastical estate ceased to have any place in parliament. The barons, or immediate vassals of the crown, at first sat in their own right, whether holding peerages or not; but afterwards the peers alone sat, the others sending their representatives. The burghesses were the representatives of the burghs. All the three estates sat to the very last in one house, the sovereign presiding in person, or through a commissioner named by him.

It would be impossible within reasonable limits to give a complete account of the original authorities for the history of Scotland. The principal ones are the following. For the period before the accession of David I.—Venerable Bede, the *Early Lives of the Saints*, the *Irish Annals*, the brief *Scottish Chronicles* published by Innes and Pinkerton, and the ancient *English Chronicle*. For the subsequent

period down to the Reformation—the *Chronicle* of Melrose and Lanercost, the *Scotch Chronicle* of Fordun and Bower, Winton's *Chronicle*, Laing's and Buchanan's *Histories*, the *English Chronicle*, the *Ecclesiastical Chartularies*, and the *Acts of the Scottish Parliament*. For the period from the Reformation to the Union—Knor's, Calderwood's, and Spottiswood's *Histories*, Baillie's *Letters*, Wodrow's and Burnet's *Histories*, the *Acts of the Scottish Parliament*, and the *State Papers*. The modern authorities are Innes's *Critical Essay on the Ancient Inhabitants of Scotland*, Pinkerton's *Inquiry into the History of Scotland*, Chalmers's *Caledonia*, Hailes's *Annals*, and Tytler's, Robertson's, Laing's, and Burton's *Histories of Scotland*, and the *Domestic Annals of Scotland*, by R. Chalmers.

SCOTLAND, CHURCH OF. An account of the already been given of the conversion to Christianity of the early inhabitants of Scotland, see COLT, CULDEES, NINIAN, PICTS, SCOTLAND, *History*. The doctrines of the ancient Scottish Church were precisely the same as those of the rest of Western Christendom. In ritual there were some points of difference, but they were so slight, that the most important related to the time of observing the Easter festival. In these, also, the Scots gradually conformed to the usage of the Roman and English Churches. In one point, however, there continued for several centuries to be a marked distinction between the Scots and the churches of England and the continent on the other. This was reference to ecclesiastical government. They recognised the same orders of the ministry, bishops, priests, and deacons, as other Christians did; like them, they held that ordination could be conferred only by bishops. But they acknowledged no supremacy of jurisdiction in the Episcopal office, as was held by other churches. In Scotland, there were neither dioceses nor parishes; but there were numerous monasteries, in which the abbots, who were bishops or priests, bore the chief rule, all being subordinate to the successor of St Columba, the presbyter-abbot of Iona, who, in virtue of his office, was primate of the Picts and Scots.

When Iona was desolated by the Northmen, the primacy seems to have been transferred in the middle of the 9th c. to the Abbots of Dunblane, and about fifty years afterwards to the Bishops of St Andrews, who became known as *Episcopos Scotorum*, the bishops of the Scots. Slowly and gradually an assimilation to the English and continental practices began, a change rendered easy by the Scottish dominion being extended to Lothian, in which the ecclesiastical system was the same as that of England. A great impulse was given in the same direction by the marriage of Malcolm III., king of the Scots, with Margaret, sister of Edgar Atheling. The king and queen made their utmost efforts to introduce the English system in ecclesiastical as in other matters; and Margaret herself held repeated conferences for that purpose with the chief Scottish ecclesiastics, at which her husband acted as interpreter. The principal reforms in which she attempted to bring about a reformation were the commencement of the Lent fast, the superstitious infrequency of receiving the communion, and the lax observance of Sunday and Scriptural and canonical restrictions on marriage relations.

The reform begun by Malcolm and Margaret was fully carried out by their youngest son, David. These improvements were completed by his successors, and before the end of the 12th c. the ecclesiastical system of S. differed in no important

SCOTLAND, CHURCH OF.

from that of the rest of Europe. Some Scottish writers have lamented the change, as being one from purity of belief and practice to superstition and immorality. This is undoubtedly a mistake. The Celtic Church had become very corrupt, and the clergy were inferior both in learning and morals to their brethren in the south. King David was a reformer in the best sense of the word, and it does not detract from the character of his reformation, that as time went on the Scottish Church became involved in those superstitions with which the rest of Christendom was overspread.

The ritual of the Scottish medieval church was almost the same as that of England, the Salisbury Missal and Breviary being the models of the Liturgies and Office Books used in Scotland. The external system of the church—cathedral, parochial, and monastic—was also in almost every point identical. The chief monastic orders were the Benedictine, and its most important branches the Cluniac and Cistercian, the canons regular of St Augustine, and the reformed Premonstratensian canons. The Cluniacs and Cistercians were in strict subordination to the mother-houses of their orders at Cluny and Cîteaux. In the 13th c. the Dominican, Franciscan, and Carmelite friars were introduced into Scotland. The chapters of all the Scottish cathedrals, except those of St Andrews and Whithorn, were composed of secular canons—the chief dignitaries being a dean, rector, chancellor, precentor, and treasurer. The prior and canons regular of the Augustinian monastery at St Andrews formed the chapter of that see, and the prior and Premonstratensian canons of Whithorn formed the chapter of the cathedral of Galloway. There were twelve dioceses in the Scottish Church, to which Orkney was added at the transference of those islands to the Scottish sovereign in the 15th century. The twelve dioceses were Caithness, Ross, Moray, Aberdeen, Brechin, Dunkeld, Dunblane, St Andrews, Argyre, the Isles, Glasgow, and Galloway. The larger of these dioceses were divided, like the English dioceses, into rural deaneries. The single point in which the medieval church down to the 15th c. differed from that of England and other churches of the west, was in its having no metropolitan. St Andrews, and next to it Glasgow, had a certain precedence; the bishops of the former see, and calling them the bishops of the latter, having the privilege of crowning and anointing the sovereign, as they had no jurisdiction over the other sees, or did their bishops bear the style of archbishop. This led to claims on the part of the Archbishops of York to metropolitan authority in S., which had no foundation except in regard to the southern portion of the diocese of St Andrews, and the see of Galloway, the bishops of which were, for several centuries, suffragans of York. The court of Rome found it convenient, for the sake of its own privileges, to encourage this anomalous system; but to provide for the meetings of the Scottish bishops in provincial council, a bull of Pope Honorius III., in 1225, authorised them to meet in synod. In virtue of this bull, the bishops, abbots, priors, and other chief ecclesiastics, with representatives of the capillary, collegiate, and conventual bodies, assembled annually in provincial synod, sitting in one house, under the presidency of a conservator chosen by and from the bishops. The chief government of the church under the pope thus devolved on these synods, and their elective presidents. This continued until the erection of St Andrews into an archiepiscopal and metropolitan see, in virtue of a bull of Pope Sixtus IV., in 1472. By this bull all the Scottish sees were made suffragans to that of St Andrews, whose bishops were now to be styled archbishops.

In 1492 Glasgow was raised to the dignity of a metropolitan see by a bull of Pope Innocent VIII., and the Bishops of Dunkeld, Dunblane, Galloway, and Argyre were made suffragans to its archbishop, an arrangement which was soon afterwards altered to some extent—Dunkeld and Dunblane being reannexed to St Andrews, and Glasgow having for its suffragan sees those of Galloway, Argyre, and the Isles. This last arrangement continued till the Reformation; and afterwards, during the establishment of Episcopacy—the two Scottish archbishops occupying towards each other precisely the same position as the Archbishops of Canterbury and York, and being sometimes involved in the same unseemly broils, in regard to jurisdiction and precedence, which long existed between the English metropolitans.

S. shared in all the errors of belief and superstitious practices in worship to which the rest of Christendom was subjected, and the ignorance and immorality of the clergy were far worse than they were in England, or perhaps anywhere in Europe, except in the Scandinavian churches. The desire for reformation which led to the proceedings of Hus and Wickliffe, produced similar effects in the Scottish kingdom. As early as the year 1406 or 1407, James Resby, an English priest, and a disciple of Wickliffe, was burned at Perth; and in 1433, Paul Crawar, a German Hussite, was burned at St Andrews. The opinions of Wickliffe continued to be privately taught, particularly in the south-western counties, where his followers were known by the name of the Lollards of Kyle. In the following century, the intercourse with the continent was frequent and close, and the effects of Luther's preaching and writings were soon felt in Scotland. In the year 1525, the importation of Lutheran books, and the propagation of the Reformer's tenets, were forbidden by an act of the Scottish parliament; and in February 1528, Patrick Hamilton, abbot of Ferne, was burned at St Andrews for teaching and publishing Lutheran doctrines. The piety of Hamilton, and the patience with which he bore his sufferings, induced others to follow his teaching and example. Several persons, both ecclesiastics and laymen, were subsequently burned, and many more fled to England or the continent.

The persecution, though encouraged or permitted by the bishops, was disapproved of by some ecclesiastics of learning and influence, who were desirous of effecting a reform in the church without breaking off from communion with the hierarchy. The efforts of this school were unsuccessful, and the Scottish nation was gradually divided into two parties—one of which, headed by the bishops, and supported by the state, was determined to resist all change; and the other, composed of a considerable number of the clergy both regular and secular, of the gentry, and of the burgesses of the large towns, was disposed to carry its reforming principles far beyond what had been done by Luther and Melancthon. These two parties came into deadly conflict in 1546. On the 28th of February in that year, George Wishart, the most eloquent of the Reforming preachers, was condemned to death by an ecclesiastical court—at which Cardinal Beaton, Archbishop of St Andrews, presided—and was burned. On the 28th of May following, the cardinal was murdered by Norman Lealie and other adherents of the Reforming party. The struggle continued during the regency of the Earl of Arran and that of Mary of Lorraine, the mother of Mary, the young queen of Scots.

In the year 1559 the Reformers became strong enough to set the regent at defiance. Various

circumstances encouraged them to demand freedom for their opinions, particularly the death of Mary of England and the accession of Elizabeth. They were further animated at this time by the return from Geneva of their chief preacher, John Knox. The conflict was to be decided by other than spiritual weapons. The regent and the Reformed, now known by the name of the Congregation, met in open warfare. The contest was carried on for a twelvemonth, and ended in the triumph of the Congregation. A parliament met at Edinburgh on the 1st of August 1560. The Reforming party had the complete ascendancy, and succeeded in passing several acts, by which the jurisdiction of the pope was abolished, the mass was proscribed, and a Confession of Faith, drawn up by Knox and his associates, was ratified, the spiritual lords making a faint resistance.

The new Confession of Faith adhered, in all essential articles of belief, to the ancient creeds of the church. In regard to the sacraments, it differed entirely from the recent corrupt teaching of the Western Church; but its language, on the whole, was moderate and conciliatory. In reference to ceremonies and the details of church polity, it declared that such things were temporary in their nature, and not appointed for all times and places, and that they ought to be altered when they fostered superstition and ceased to be conducive to edification.

A Book of Discipline was soon afterwards drawn up by the compilers of the Confession, which was generally approved of, but did not receive the sanction of parliament. It followed out in detail the principles laid down in the Confession. In regard to the office-bearers of the church various orders were mentioned, but three were specially of importance—ministers, elders, and deacons. Ministers were to be chosen by each several congregation, but were to be examined and admitted in public by the ministers and elders of the church. No other ceremony, such as imposition of hands, was to be used. The elders and deacons were to be chosen yearly in each congregation, and were not to receive any stipend, because their office was only to be from year to year, and because they were not to be debarred from attending to their own private occupations. In order to the better provision for the wants of the time, certain persons, called superintendents, were appointed in particular districts, with power to plant and erect churches, and to appoint ministers within the bounds of their jurisdiction.

The chief governing as well as legislative and judicial power in the Reformed Church was intrusted to a General Assembly, which met half-yearly or yearly, and was composed of the superintendents, ministers, and lay commissioners, and which gradually, by the introduction of the system of representation, assumed the form and more than the power of a parliament.

The worship of the Reformed Church was modelled on that established by Calvin at Geneva. It was embodied in a formulary called the Book of Common Order, which for nearly a century continued to be generally used. It contained forms for the ordinary worship both on Sundays and weekdays, and for the administration of the sacraments, and for certain other occasions. The minister was not absolutely restricted to these forms. Except in the singing of Psalms, the people took no direct part in ordinary worship, and there was no distinction of ecclesiastical seasons, all holydays whatever except Sunday being abolished.

The form of church government established at the Reformation did not remain long undisturbed.

Some of the most zealous Protestants thought danger to which the church was exposed from royal tyranny and aristocratical oppression, could best be met by restoring the bishops to their ancient position both in the church and in the parliament; while others, of equal zeal and sincerity, saw in this the commencement of a plan for bringing back the errors of popery. A scheme of this kind was actually established for some time, and the seats were filled with Protestant bishops set apart to the office by their brethren of the ministry. It was almost immediately attacked by some of the ministers, who soon found a leader in Andrew Melville, a scholar of considerable eminence, who returned to Scotland in 1574, after a residence at Geneva, during which he had ardently embraced the new opinions as to ecclesiastical government maintained by Beza.

The struggle continued for some years, the bishops being encouraged by the sovereign and his advisers whose support was frequently of little real advantage to them, and Melville receiving the zealous assistance of many of the ministers, and of the great body of the common people, who sympathised with his democratical theories of civil and ecclesiastical government. Melville was at last entirely successful. His opinions were embodied in what was called the Second Book of Discipline, which received the formal sanction of the General Assembly in 1592. This formulary differed very much from the First Book. It laid down authoritatively those principles in regard to ecclesiastical authority which the English Puritans were vainly striving to establish in the southern kingdom, and was in reality an attempt to make the civil power subordinate to the ecclesiastical, even in matters secular. It required four orders of office-bearers in the church, the Minister, or Bishop, the Doctor, the Presbyter, Elder, and the Deacon. These were to be set apart by ordination, and the imposition of the hands of the eldership, but no one was to be intrusted into any office contrary to the will of the congregation, or without the voice of the eldership. Four sorts of church courts, each rising above the other, were sanctioned; first, of particular congregations, one or more; second, of a province, or what afterwards called the Provincial Synod; third, of the whole nation; and fourth, of the universal church. What is generally regarded as the most essential feature of the Presbyterian system—the Presbytery—was not yet introduced in its proper form, the lowest court being a combination of what were afterwards known as the Presbytery and the General Session. It was, however, introduced before the year 1592, when the privileges of general and provincial assemblies, presbyteries, and parishes were ratified by parliament, though the Book of Discipline itself did not receive any sanction.

King James had agreed to the establishment of Presbyterianism, but personally, and as a sovereign, he disliked its discipline, and he soon endeavoured to overthrow it. His accession to the crown of England enabled him to do this with more authority. He gradually obtained from the General Assembly recognition of the civil rights of the bishops, and this led to the restoration of their ecclesiastical privileges. His changes were sanctioned by the General Assembly which met at Glasgow in 1606, and in the course of the same year Episcopacy was restored in reality, as well as in name, by the consecration of three Scottish prelates, by four English bishops, at London.

The king wished to assimilate the Scottish church as far as possible, to that of England, and the most important movement was the establishment of a

are called the Five Articles of Perth. See PERTH, THE FIVE ARTICLES OF.

These various changes excited great dissatisfaction in Scotland, particularly in the southern counties, but it gradually abated to a considerable extent, and might have altogether ceased, had not further innovations been attempted. It was the wish of James to introduce a prayer-book like that of the English Church, in place of the Book of Common Order, but he saw the danger with which the proposal was attended, and gave it up or postponed it. His son Charles was as inferior to his father in rudeness, as he excelled him in conscientiousness and religious zeal. During his first visit to Scotland he added another bishopric—that of Edinburgh—to the dioceses of the Scottish Church. Most unwisely, and most improperly, he endeavoured by his royal authority to introduce into that church

Book of Canons and a Liturgy framed on the model of those of England. The king had many royal supporters in all parts of Scotland, and in the north Episcopacy was preferred by the people to Presbyterianism. But the storm of popular indignation which was now roused swept everything before it. The king's opponents banded themselves together by the National Covenant, and at a General Assembly held at Glasgow abolished the Perth articles and Episcopacy, and re-established Presbyterianism. Charles attempted to maintain his claim by the sword, but was unsuccessful, and obliged to signify in parliament all that had been done by his opponents.

Had the Covenanters been satisfied with the victory which they had won, Presbyterianism might have remained the established religion of the Scottish kingdom. But they could not resist the entreaties for aid from the English Puritans, or rather they yielded to the delusion of extending their own discipline over the churches of England and Ireland. They just attempted, in an opposite direction, what James and Charles had failed to accomplish. For a time their policy seemed to triumph. The Solemn League and Covenant of the three kingdoms, after having been approved by the General Assembly in Scotland, was signed by the assembly of Divines which the parliament had summoned to meet at Westminster, and by the parliament itself. The ecclesiastical documents which were afterwards drawn up, originated with the Assembly of Divines, but were sanctioned by the Assembly in Scotland. The principal of these were a Directory for Public Worship, a Confession of Faith, and a Larger and Shorter Catechism. See ASSEMBLY OF DIVINES, and CREEDS AND CONFESSIONS. The first of these documents was intended to supersede the Book of Common Prayer in England, and, indirectly, the Book of Common Order in Scotland. It laid down certain general rules in regard to public worship and the administration of the sacraments, but left very much to the discretion of the particular ministers and congregations.

The union between the Scottish and English Puritans was dissolved by the ascendancy of the Independents. Scotland, distracted by civil and ecclesiastical dissension, was unable to defend itself against Cromwell. It was conquered and kept thoroughly under subjection by the English army, which forbade the meetings of the General Assembly, shut up the other courts and the rest of the church system as they were before. At the Restoration, the higher classes generally, who had suffered under the ecclesiastical tyranny of the ministers, were zealous for the re-establishment of Episcopacy. The western part of the nation, except in the south-western provinces, was indifferent, and the king

experienced no difficulty in restoring the bishops to their former rights both in church and state. But Episcopacy alone was restored; there was no attempt to introduce a liturgy, or even to enforce the observance of the Perth Articles. The new primate, Archbishop Sharp, was an able man, of good moral character, but ambitious and overbearing, and the Covenanters never forgave his change from Presbyterianism, though he had always belonged to the more moderate of the two parties into which the church was divided. He was almost the only one of the bishops who enjoyed political influence; and unfortunately for himself and the hierarchy, that influence was generally used to encourage, not to restrain, the severe measures of the government. When the primate was assassinated, that severity became a cruel tyranny, and many who had no predilection for any particular ecclesiastical opinions were ready to welcome the change which took place at the Revolution.

When the Scottish Estates met in 1689, to consider what course was to be adopted in the northern kingdom, the bishops declined to abandon King James. Whatever might have been the consequences had they taken an opposite course, this resolution was fatal to the Episcopal establishment. William and Mary were called to the throne, and Prelacy was declared to be an insupportable grievance, and was abolished. In the following year, Presbyterianism was re-established, and the Westminster Confession of Faith was ratified as the national standard of belief, and the right of patrons to nominate to ecclesiastical benefices was taken away. In the end of the same year a General Assembly was held, the first which had been allowed to meet since its dissolution by the order of Cromwell. It was composed, as before, of ministers and elders from the various presbyteries, and of elders from the burghs and universities, and was presided over by a lay commissioner, named by the crown, and a minister elected by the members as moderator. With the exception of some years in the reign of William, the Assembly has continued to meet annually since the Revolution, and to transact business during the periods when it was not in session by a commission named by itself for the purpose. See ASSEMBLY, GENERAL. The other chief ecclesiastical events of William's reign were a series of vain attempts on the part of the sovereign to bring about a comprehension of the Episcopal clergy with those of the Establishment, and the passing by the Assembly in 1697 of what was called the 'Barrier Act' (q. v.), which guarded against sudden legislation, by providing that no permanent act should be passed until it had received the approbation of the majority of the presbyteries.

During the reign of Queen Anne, and in the year 1707, England and Scotland were united into one kingdom. A special statute was passed for the security of the Protestant religion and Presbyterian church government in the latter country; providing that these should continue without any alteration in time to come, and confirming the act of William and Mary, which ratified the Confession of Faith, and settled the Presbyterian form of church government.

In the year 1712, an act was passed by the British parliament which restored to patrons in Scotland their right of presentation to benefices. This statute excited great discontent among the members of the Established Church, and for many years attempts were made to obtain a repeal of it. These attempts were unsuccessful, but its provisions were long practically disregarded. When at length the General Assembly began to act upon it, the dissatisfaction increased among those who

held the divine right of the people to choose their own ministers. The leader of the discontented party was a minister named Ebenezer Erskine, and he with his adherents, in the year 1733, finally separated from the Establishment, and formed a communion which took the title of the Associate Presbytery, though its members were popularly known as the Seceders. The Seceders themselves were soon divided by a very absurd dispute into two bodies, called the Burgher and Antiburgher Synods. In the year 1761, another secession from the Establishment took place in connection with the law of patronage; and the separated body assumed the name of the Presbytery of Relief.

There were no further secessions from the church; but its members were divided into two parties, known as the Moderates and the Evangelicals (q. v.), the former of whom were favourable, the latter hostile to the law of patronage. For many years the Moderates, headed by Dr Robertson the historian and others of his school, and supported by the influence of the government, maintained an ascendancy in the General Assembly and throughout the country. In the latter years of George III., and during the reign of George IV., this ascendancy began to decrease. The political excitement which prevailed in the beginning of the reign of William IV. strongly affected the Scottish Establishment, which from its very constitution is peculiarly liable to be moved by the impulses of popular feeling. The two parties in the General Assembly engaged in a struggle more fierce than any in which they had yet met; and the subject of dispute, as before, was immediately connected with the law of patronage. Dr Chalmers, the most distinguished minister in Scotland, added the whole weight of his influence to the popular party, and in 1834 an interim act of Assembly was passed, known as the Veto Act, which declared it to be a fundamental law of the church that no pastor should be intruded on any congregation contrary to the will of the people, and laid down certain rules for carrying out this principle. The legality of this act was doubted; and in connection with a presentation to the parish of Auchtermadar, the presentee, on being rejected by the presbytery in terms of the Veto Act, appealed, with concurrence of the patron, to the Court of Session—the supreme civil court in Scotland. That court decided that the conduct of the presbytery in rejecting the presentee was illegal, and their judgment was affirmed by the House of Lords. Other cases of a similar nature followed, and something like a conflict took place between the civil and ecclesiastical courts, the former enforcing their sentences by civil penalties, the latter suspending and deposing the ministers who obeyed the injunctions of the Court of Session. In the General Assembly of 1843 the dispute came to a crisis. A large number of ministers and elders of the popular party left the Assembly, and met apart in a similar body, of which Dr Chalmers was chosen moderator. They formed themselves into a separate communion under the title of 'The Free Church of Scotland,' and gave up their benefices in the Established Church, and all connection whatever with that body. The Free Church carried off about one-half of the members of the Establishment, and became a rival communion in most of the parishes of Scotland. See FREE CHURCH.

Before the commencement of this great struggle, and again soon after its conclusion, the divisions connected with the older separation were partially healed. In 1820 the Burgher and Antiburgher Seceders were united under the name of the Associate Synod of the Secession Church; and in 1847 this Associate Synod and the Relief Synod were

united under the name of 'The United Presbyterian Church' (q. v.). The recent negotiations for a union of the United Presbyterian Church and the Free Church have led to no practical result.

A few remarks may be added on the history of Scottish Episcopacy subsequently to the Revolution. It is a common but erroneous opinion that almost all the Episcopal clergy were Jacobites from the time of the accession of William and Mary. The bishops were so; but a large number, probably a considerable majority of the clergy, had at first no objection to take the oath of allegiance to the new government. During the reign of Queen Anne, the Episcopal clergy were well disposed to the government, knowing the queen's good wishes to their communion. They were frequently harassed by the courts of the Establishment; but all who were willing to take the oath obtained an ample protection for their worship; the passing of the Toleration Act of 1712. On the death of the queen, almost all the clergy, and many of the laity, were involved directly or indirectly in the attempts to overthrow the Hanoverian dynasty, and it was this which finally made the names Episcopalian and Jacobite for many years convertible terms.

In the meantime, the succession of bishops had been kept up by new consecrations, and after a few years the dioceses, though diminished in number, were regularly filled. An important change took place in the forms of worship. No longer transcribed by their connection with the state, they assumed liturgical forms similar to those in the English Prayer-book, and in almost all cases identical with that of many of the congregations used an Office of the communion modelled on that of the Anglican Liturgy of King Charles I. The Episcopalian clergy took no such open part in the insurrection of 1745 as they did in that of 1715, but their sympathies were known to be with the House of Stewart; and the government carried through parliament some stringent acts, which were put in execution with harshness, and which for many years suppressed public worship in the Episcopal communion. It was only after the accession of George III. that these statutes ceased to be actively enforced; and it was not till 1792 that the Episcopalian clergy, from the death of Prince Charles had acknowledged the reigning dynasty, were relieved from the penalties. The act which gave this relief imposed restrictions on their clergy officiating in England, and prohibited their holding benefices in the Established Church. In 1804, the bishops and clergy adopted the Thirty-nine Articles of the Church of England, and in 1863, the Prayer-book was adopted as the authorised service-book of the Episcopal Church, permission being given in certain cases to use the Scottish Communion Office. The restrictions imposed on the Scottish clergy by the act of 1792 were modified by an act passed in 1840; and as the restrictions were entirely removed, the right being reserved to bishops in England and Ireland to refuse admission to a Scottish clergyman without assignment of reason, on his first presentation to a benefice in England or Ireland, but not after he should have once held such benefice.

The dioceses of the Scottish Episcopal Church are seven in number, viz., Moray, Aberdeen, Argyll, St Andrews, Edinburgh, and Glasgow. The bishops are chosen by the clergy of the diocese and by representatives of the lay communicants; a majority of both orders being necessary to a valid election. One of the bishops, under the name of Primus, chosen by the other bishops, presides at the meetings of the bishops, and has certain privileges, but possesses no metropolitan authority.

SCOTLAND, ROYAL ARMS OF—SCOTT.

The highest judicial body is the Episcopal College, composed of all the bishops. The highest legislative body is a General Synod, composed of two houses, the one of the bishops, the other of the deans and the representatives of the clergy.

The chief original authorities for the ecclesiastical history of Scotland down to the Revolution are the same as those mentioned in the article on the Civil History (q. v.). The chief modern authorities are: Cook's *History of the Reformation and History of the Church of Scotland*; Cunningham's *Church History of Scotland*; Grub's *Ecclesiastical History of Scotland*.

SCOTLAND, ROYAL ARMS OF. The arms of Scotland are—Or, a lion rampant gules, armed and langued azure, within a double treasure flory counterflory of fleurs-de-lis of the second. Supporters—Two unicorns argent armed maned and unguled or, gorged with open crowns, with chains affixed thereto, and reflexed over the back of the last. Crest—A lion sejant affronté gules crowned

declared (Art. 1) that the ensigns of the United Kingdom should be in future such as her majesty should appoint 'on all flags, banners, standards, and ensigns, both on sea and land;' the same mode of marshalling being adopted in England and Scotland. But Art. 24 has been sometimes supposed to leave room for a different mode of marshalling on the seals in use in matters relating exclusively to Scotland, and on the Great and other seals of Scotland. Since, as well as before the Union, precedence has been given to Scotland. The question of the proper marshalling of the royal arms within Scotland was raised in 1853 by a petition to the Queen by the magistrates of Brechin; a reference was made by the Home Office in the first instance to Garter King-at-Arms, and Garter's report was transmitted to the office of the Lord Lyon, where it was returned with observations by the Lyon Depute, who considered Scotland entitled to precedence on the judicial seals of the country; and his views have since continued to be acted on.

SCOTT, DAVID, a remarkable Scottish painter, was born in Edinburgh, October 10, or 12, 1806. He may be said to have commenced his career as an artist by an apprenticeship to his father, who was a landscape engraver; but endowed as he was with a deep, stern, sombre genius, it was soon visible to all who knew him that he was meant to be a painter. The first production that he ventured to send to the British Institution, 'Lot and his Daughters fleeing from the Cities of the Plain,' was returned as too large; but S. was too 'imperiously original' to take advice, and went on courageously painting pictures which, it has been said, 'would have required a hall for their exhibition, and which the public would neither admire nor buy.' In 1831, he exhibited the 'Monograms of Man,' a series of singularly suggestive sketches; and the first of his illustrations to Coleridge's *Ancient Mariner*, which are almost equal to the poem itself in weird and vivid beauty. In 1832, among others, 'Sarpedon carried by Sleep and Death,' a very fine work. In the autumn of the same year he set out for Rome, visiting most of the famous artistic cities on his way. Nothing, however, that he saw in Italy or France, materially

affected the bent of his genius, and his picture of 'Discord, or the Household Gods Destroyed,' painted there, exhibits all the peculiarities of his style and thought in a rampant and even repellent manner. In 1834 he returned to Edinburgh, and resumed his solitary brush. Passing over several interesting works, we may specially mention, as belonging to the year 1838, 'Ariel and Caliban,' and the 'Alchemist,' two of his best efforts in point of execution. Between 1840 and 1843, his chief productions were 'Philoctetes,' 'Queen Elizabeth in the Globe Theatre,' 'The Duke of Gloucester taken into the Water-gate of Calais,' 'Silenus praising Wine,' 'Richard III. ;' his illustrations (40 in number) of *The Pilgrim's Progress*, in which, as in those of *The Ancient Mariner*, he rivals the genius of the author he illustrates. In 1847, he produced the masterpiece of his whole career, 'Vasco de Gama encountering the Spirit of the Cape.' But S., always delicate, and even drooping in health, had now exhausted himself, and on the 5th of March 1849 he died, when fame was only beginning to encircle his name. S.

Royal Arms of Scotland, previous to the Union.

or, holding in the dexter paw a sword, and in the sinister a sceptre, both erect proper.

The lion is first seen on the seal of Alexander II., and the treasure on that of Alexander III. The unicorn supporters do not appear on any of the royal seals of Scotland till the time of Queen Mary, on whose first Great Seal (1550) they are represented as chained and gorged with crowns. They were, however, sculptured on Melrose Abbey as early as 1305.

In 1603, in consequence of the union of the crowns of England and Scotland, the Scottish arms came to be quartered with those of England and Ireland, while one of the English lions was adopted as a supporter. Precedence was, however, given within Scotland to the Scottish ensigns, which occupied the first and fourth quarters, and the unicorn also obtained the place of honour, being dexter supporter. From about the time of Charles I. to 1707, it became the practice to represent the unicorn as not merely gorged with an open crown, but crowned with an imperial crown. The Treaty of Union of 1707

contributed some vigorous essays on 'The Characteristics of the Great Masters' to *Blackwood's Magazine*. An unusually interesting *Memoir* by his brother, W. B. Scott, was published in 1850.

SCOTT, SIR MICHAEL, a medieval scholar and philosopher of the 13th c., whose real history is not only obscure but positively unknown. Boece identifies him with a Michael Scott of Balweary, in the parish of Kirkcaldy, in Fifeshire, who, along with Sir Michael de Wemyss, was sent to Norway in 1290, by the Scottish Estates, to bring home the 'Maiden of Norway,' and his death is fixed in the following year. But Sir Robert Sibbald, in his *History of Fife and Kinross* (published in the reign of Charles II.), speaks of a certain indenture, dated 1294, to which S.'s name was affixed, and in another part of the same book states that he went on a second embassy to Norway, in 1310, to demand the cession of the Orkneys. If we may rely upon Sir Robert's statement, it is hardly possible that the Scotch 'wizard' of European renown could have been the same person as Michael Scott of Balweary, because (as the story goes) after studying at Oxford or Paris, he went to the court of Frederic II., and wrote there some books at the request of that monarch. Now Frederic died in 1250, and supposing 'the wizard' not more than 30 years old at that time, this would make him 70 when he went to Norway the first time to bring home the 'Maiden,' and 90 on his second visit to demand the cession of the Orkneys; neither of which things is likely. Hector Boece, it should be observed, is our sole authority for the identification of Michael Scott of Balweary with the wizard, while, on the other hand, Dempster, in his *Historia Ecclesiastica Gentis Scotorum* (Bologna, 1627), distinctly avers that the name *Scotus*, borne by the latter, was that of his nation and not of his family—Michael, 'the Scot.' It has been suggested that the ambassador may have been the son of the wizard, and that Boece may have confounded the two—a supposition probable enough in itself, but for which, in the absence of evidence, nothing can be said. The legend is further complicated by the fact that it appears to be English as well as Scottish. Cumberland claims the magic hero for herself. Camden, in his *Britannia* (1586), asserts that he was a monk of Ulme or Holme Cultram in that country, about 1290, 'who applied himself so closely to the mathematics, and other abstract parts of learning, that he was generally looked on as a conjuror; and a vain credulous humour has handed down I know not what miracles done by him.' He likewise states that S.'s 'magic books' were preserved there, but adds that they were then mouldering into dust; and Satchell (see his rhyming *History of the Right Honourable Name of Scott*) declares that he examined a huge tome which was held to be the wizard's, at Burgh-under-Bowness in 1629. According to the Scottish legend, he was buried in the Abbey of Melrose, and the Border was the scene of many of his most wonderful exploits, such as the cleaving of the Eildon Hills into three separate cones, and his bridling of the river Tweed! Dante mentions him in his *Inferno* (some years before 1321), in a way that shews that already his fame as a magician had spread over the continent, and suggests the suspicion that he must have died sooner than is commonly believed. All, however, that any one who rationally looks at the legend can believe is, that a certain Michael Scott, or Michael the Scot, flourished in the 13th c., and was mistaken by the common people of his country for a wizard or magician, probably on account of his skill as an experimentalist in natural philosophy. The writings attributed to him indicate that his studies lay in this direction.

SCOTT, SIR WALTER, the fourth child of Walter Scott, Writer to the Signet in Edinburgh, was born in that city on the 15th August 1771. He came of the old Border family, the Scotts of Harden, an offshoot from the house of Buccleuch. Though he matured into a man of robust health and of strength nearly herculean, as a child he was feeble and sickly, and very early he was afflicted with a lameness which remained with him throughout his life. His childhood was passed for the most part at Sandyknowe, the farm of his grandfather, in Roxburghshire. Here the foundations of his mind were laid; and his early and delighted familiarity with the ballads and legends then floating over that part of the country, probably did more than any other influence to determine the sphere and modes of his future literary activity. Between the years 1779 and 1783 he attended the High School of Edinburgh, where, despite occasional flashes of talent, he shone considerably more on the playground as a bold, high-spirited, and indomitable little fellow, with an odd turn for story-telling than within he did as a student. In 1783, he went to the University, and for three years he remained there, as it seemed, not greatly to his advantage. Afterwards, in the height of his fame, he was wont to speak with deep regret of his neglect of his opportunities. But though leaving college scantily furnished with the knowledge first taught there, in a desultory way of his own, he had been hiving up stores of valuable, if unassorted information. From his earliest childhood onward, he was a ravenous and insatiable reader; his memory was of extraordinary range and tenacity, and of what he either read or observed he soon had forgot almost nothing. Of Latin, he knew a little, of Greek less; but a serviceable, if somewhat inexact knowledge of French, Italian, Spanish, and German he had acquired, and he continued to do so. On the whole, for his special purposes, his education was perhaps as available as if he had been the pride of all his preceptors. In 1786, he was apprenticed to his father, in whose office he worked as a clerk till 1792, in which year he was called to the bar. In his profession he had fair success; in 1797 he was married to Charlotte M. Carpenter, a lady of French birth and partiality. Towards the end of 1799, through the intervention of his friends Lord Melville and the Duke of Buccleuch, he was made sheriff-depute of Selkirkshire, an appointment which brought him £300 a year, not very much to do for it. Meantime, in a partitive and intermittent way, his leisure had been occupied with literature, which more and more distinctly announced itself as the main business of his life. His first publication, a translation of R. B. ballads, *Lenore* and *The Wild Huntsman*, was in 1796. In 1798 appeared his translation of Goethe's drama of *Goetz von Berlichingen*. In the year following he wrote the fine ballads *Julia*, *the Eve of St John*, and *the Gory*. The year 1802 gave to the world the first volumes of his *Border Minstrelsy*, which was followed in 1803 by a third and final one, the fruit of those 'raids'—as he called them—over the Border counties, in which he had wont to spend his vacations, was most favourably received by the public, and at once won for him a prominent place among the literary men of his time. In 1804, he issued an edition of the poem *Sir Tristrem*, admirably edited and illustrated by valuable dissertations. Meantime *The Last Minstrel* had been in progress, and its publication in 1805, S. became at a bound the most popular author of his day. During the next years, besides a mass of miscellaneous work

most important items of which were elaborate editions of Dryden (1808) and of Swift (1814), including in either case a Life, he gave to the world the poems *Marmion* (1808), *The Lady of the Lake* (1810), *The Vision of Don Roderick* (1811), *Rokeby* (1812), *The Bridal of Triermain*, anonymously published (1813), *The Lord of the Isles*, and *The Field of Waterloo*. The enthusiasm with which the earlier of these works were received somewhat began to abate as the series proceeded. The charm of novelty was no longer felt; moreover, a distinct deterioration in quality is not in the later poems to be denied; and in the bold outburst of Byron, with his deeper vein of sentiment and concentrated energy of passion, a formidable rival had appeared. All this S. distinctly noted, and after what he felt as the comparative failure of *The Lord of the Isles* in 1815, with the trivial exception of the anonymous piece *Harold the Dauntless* (1817), he published no more poetry. But already in *Waverley*, which appeared without his name in 1814, he had achieved the first of a new and more splendid series of triumphs. *Jay's Manerling*, *The Antiquary*, *The Black Dwarf*, *Old Mortality*, *Rob Roy*, and *The Heart of Midlothian* rapidly followed, and the 'Great Unknown,' as he was called (whom yet every one could very well guess to be no other than Walter S.), became the idol of the hour. The rest of the famous series, known as the *Waverley Novels*, it would be idle to mention in detail. From this time onward, for some years, S. stood on such a pinnacle of fame and brilliant social prosperity as no other British man of letters has ever gone near to reach. He resided chiefly at Abbotsford, the 'romance in stone' he had built himself in the Border country which he loved, and thither, as 'Pilgrims of his Genius,' summer after summer repaired crowds of the noblest and the distinguished, to partake the princely hospitalities of a man whom they found as delightful in the easy intercourse of his home, as before they had found him in his writings. In 1820, to set a seal upon all this distinction, a baronetcy was bestowed upon him as a special mark of the royal favour. At the stately fabric of his fortunes, secure as it seemed, was in secret built upon the shifting sands of commercial speculation, and in the disastrous crisis of the year 1826 a huge ruin smote it. In 1805, S.'s income, as calculated by his biographer, was something nigh £1000 a year, irrespective of what literature might bring him; a handsome competency, shortly by his appointment to a clerkship of the Court of Session, to have an increment at first of £800, subsequently of £1300. But what was ample for all prosaic needs, seemed poor to his imagination with its fond and glittering dreams. Already some such vision, as at Abbotsford was afterwards realised, flitted before his mind's eye, and it was the darling ambition of his heart to create and leave behind him, in the founding of a family, some image of the olden glories which were the life of his literary inspirations. In the year now mentioned, lured by the prospect of profit, and without the knowledge of his friends, he joined James Ballantyne, an old schoolfellow, in the establishment of a large printing business in Edinburgh. To this, a few years afterwards, a publishing business was added, under the nominal conduct of John Ballantyne, a brother of James; S., in the new adventure, becoming as before a partner. Gradually the affairs of the two firms became complicated with those of the great house of Constable & Co., in the sudden collapse of which S. found himself one forenoon a bankrupt, with personal liabilities to the extent of something like £150,000.

'In the reproof of chance
Lies the true proof of men'—

and now, in this challenge of adverse fate, S.'s manhood and proud integrity were most nobly approved. With his creditors, composition would have been easy; but this usual course he disdained. 'God granting him time and health,' he said, he would owe no man a penny. And somewhat declined as he now was from the first vigour and elasticity of his strength, he set himself by the labour of his pen to liquidate this enormous debt.

Breaking up his establishment at Abbotsford, where the wife whom he loved lay dying, he hired a lodging in Edinburgh, and there for some years, with stern and unflinching resolution, he toiled at his prodigious task. The stream of novels flowed as formerly; a *History of Napoleon*, in eight volumes, was undertaken and completed, with much other miscellaneous work; and within the space of two years, S. had realised for his creditors the amazing sum of nearly £40,000. A new and annotated edition of the novels was issued with immense success, and there seemed every prospect that, within a reasonable period, S. might again front the world, as he had pledged himself to do, not owing to any man a penny. In this hope he toiled on; but the limits of endurance had been reached, and the springs of the outworn brain broke in that stress of cruel and long-continued effort. In 1830 he was smitten down with paralysis, from which he never thoroughly rallied. It was hoped that the climate of Italy might benefit him; and by the government of the day a frigate was placed at his disposal in which to proceed thither. But in Italy he pined for the home to which he returned only to die. At Abbotsford, on the 21st September 1832, he died with his children round him and the murmur of the Tweed in his ears. On the 26th, he was buried beside his wife in the old Abbey of Dryburgh.

In estimate of S. as an author, a few words must suffice. As regards his poetry, there is now little difference of opinion. Its merits, if somewhat superficial, are very genuine, and continue to secure for it some portion of the popular favour with which it was at first received. Deficient in certain of the higher and deeper qualities, and in those refinements of finish which we are of late accustomed to exact, it is admirable in its frank abandon, in its boldness and breadth of effect, its succession of clear pictures, its careless, rapid, easy narrative, unflinching life, spirit, vigorous and fiery movement. As a lyricist, S. specially excelled; and scattered hither and thither in his works are to be found little snatches of ballad and song scarcely surpassed in the language. The rank of S. as a writer of prose fiction, it is not so easy to fix with anything like precision. So imposing to the mind is his immense prestige as a novelist, that even at this date it is difficult to criticise him coolly; but it is not without risk of awakening some under-murmur of dissent, that the absolute supremacy can now be assigned him which at one time, almost without question, used to be conceded as his due. Nor is the dissent without some just ground of reason. S., with the artistic instinct granted him in largest measure, had little of the artistic conscience. Writing with the haste of the *improvisatore*, he could exercise over his work, as it proceeded, no jealous rigour of supervision; and on its appearance he was amply pleased with it if the public paid him handsomely. Hence he is an exceedingly irregular writer; many of his works are in structure most lax and careless, and some of the very greatest of them are disgraced by occasional infusions of obviously inferior matter. Yet, all reasonable deductions made, it may be doubtful whether in mass and stature he is quite reached by any other novelist who could be mentioned. To class him, or even speak of him along

with Shakspeare, is absurd; but it is scarcely absurd perhaps to say that, *since* Shakspeare, to no British man has such wealth in this kind been intrusted. If, as we believe, the final test of greatness in this field be the power to vitalise character, to enrich our experience by imaginative contact with beings ever after more intimately distinct and real for us than the men we daily shake hands with, very few writers can be held to surpass Scott. Further, he invented the historical novel, and in doing so, created a distinct literature, brought life into our conceptions of the past, and revolutionised our methods of writing history itself by a vivid infusion into them of picturesque and imaginative elements. On his *Scottish* novels his fame most securely rests; the others, for the most part, being obviously at times even painfully inferior. S.'s was essentially a great, shrewd, sagacious, *practical* intelligence; on the speculative side he was not so properly weak as entirely defective.

SCOTT, WINFIELD, American general, was born at Petersburg, Virginia, of Scottish ancestry, January 13, 1786, was educated at William and Mary College, and studied the profession of law; but in 1808, having a genius for military pursuits, he was appointed captain of light artillery in General Wilkinson's division, stationed at Baton Rouge, Louisiana, but was suspended for having accused his general of complicity with the conspiracy of Aaron Burr. At the commencement of the war of 1812, he was appointed lieutenant-colonel, and sent to the Canadian frontier. He crossed with his regiment at Queenston Heights, where the American troops were at first successful; but on the British receiving reinforcements, they were repulsed with heavy loss, and S. was taken prisoner. The following year, having been exchanged, he was appointed adjutant-general, and was wounded by the explosion which followed the assault on Fort George. In 1814, as brigadier-general, he established a camp of instruction, and from April to July drilled his raw levies in the French tactics with such effect, that on the 3d of July he took Fort Erie, opposite Buffalo, by assault; and on the 5th fought a sharp drawn battle at Chippewa, and twenty days after, the famous frontier battle of Lundy's Lane, in which he had two horses killed under him, and was twice wounded, the last time severely. He was raised to the rank of major-general, and compiled the General Regulations of the Army, and translated and adapted from the French the system of Infantry Tactics, which has since been the text-book of the American army. In the Indian hostilities of the American frontier, in the excitement attending the threat of Nullification in South Carolina, and in the Seminole war, General S. manifested those qualities of wisdom and moderation which made him rather a pacificator than a warrior. During the Canadian revolt of 1837—1838, he displayed great tact in allaying the excited passions of the frontier. In 1841 he was appointed commander-in-chief of the U.S. army, and in 1846 directed the military operations in the war against Mexico. Taking the field in person, he, March 9, 1847, landed 12,000 men at Vera Cruz, and invested and bombarded the city, which capitulated on the 28th. April 18th he carried the heights of Cerro Gordo, on the 19th he took Jalapa, on the 22d Perote, and on May 15th Puebla, where, owing to his heavy losses, chiefly by diseases incident to the climate, he was obliged to wait for reinforcements. On the 10th of August he advanced, with 10,780 men, to encounter the larger forces and strong positions of General Santa Anna. He turned and won the brilliant victories of Contreras and San Jacinto. Santa Anna entered upon his flight, and gained time and strengthened

his defences. These were followed by the sharp and sanguinary battles of Molino El Rey and Churubusco, September 8th, strong positions skilfully and bravely defended by superior numbers; and on the 14th S. entered the city of Mexico at the head of less than 8000 soldiers. Peace was negotiated with the cession of New Mexico and California to the United States, and the victorious general was welcomed home with the liveliest demonstrations. In 1852 General S. was the candidate of the Whig party for the presidency, but was defeated by one of his subordinate officers, General Franklin Pierce. In 1855, was created for him the office of lieutenant-general. At the beginning of the war of Secession in 1861, he foresaw more than many others the extent and serious character, and advised the calling out a much larger force than was first brought into the field. He had even suggested the advisability of allowing the 'wayward sisters to part in peace.' Age and growing infirmities compelled him in November, 1861 to retire from active command. He subsequently visited Europe and published his *Memoirs* (8 vols., New York, 1864). S. died May 29, 1866.

SCOTTISH LANGUAGE AND LITERATURE. As the Scots were originally Irish who settled in the Western Highlands of Alban. The phrase 'Scottish language' ought to denote, and originally denote, *Erse*, or *Gaelic*; but the gradual extension of the authority of the Scottish king first over their Celtic neighbours the Picts, then over the Kymry or Cymry (q. v.) of Strathclyde, and the Angles of Lothian and the Merse, led to the name 'Scottish' being given to the language of the last of these; though, in reality, the true 'Scottish'—i.e., the Gaelic, the speech of Kenneth MacAlpin and Malcolm Canmore, is further removed from the 'Scottish' of Ramsay and Burns (which is simply a dialect of northern English)—the latter is from Russian or Sanscrit. On this point Mr Murray remarks in a scholarly paper, rather treatise, in the *Transactions of the Philological Society* for 1873, which bids fair to become a standard authority on the subject: 'Ethnologically speaking, the Lowland Scotch dialects are forms of the Angle, or English, as spoken by those northern members of the Angle or English race who were subjects of the king of the Scots. . . . More particularly they are forms of the Northumbrian or northern English—"the language of the North-lands"—which up to the war of independence was spoken as one language, from the Humber to the Forth, the Grampians, and the Moray Firth. . . . which, since the final renunciation of attempts to the independence of the kingdom, has had a literature and culture of its own, has been influenced by ecclesiastical institutions, an ecclesiastical system, a foreign connection, and a national life, altogether distinct from those which have operated upon the same language on the southern side of the Border.'

Using, then, the term 'Scottish' to denote the dialect of English used north of the Tweed, and on all consideration of anything written in it, we may divide the history of *Scottish literature* into two periods; the first extending from the time of the earliest composition to the union of England and Scotland under one king, the second from that time to the present day.

A well-known brief lament for the death of Alexander III. preserved by Wyntoun, and marked by considerable beauty and pathos, is generally supposed to be one of the earliest specimens of Scottish poetry which has come down to us. The *Scottish poet*—in the proper sense of the word—was John Barbour (q. v.), archdeacon of Aberdeen, who was born in the first half of the 14th century and died in 1395. His great work is the poem of

Brus, in which he celebrates the struggles and final victory of the Scottish king, Robert I. It is superior to any composition by English writers of the same century, with the exception of Chaucer and Piers the Plowman. The language of Barbour is even purer English than that used by the great author of the *Canterbury Tales*. There are editions of *The Brus* by Pinkerton and Jamieson, but the latest and best is that by Mr Cosmo Innes, published in 1856.

The 15th c., during which England produced no poetical writer of eminence, was fertile in Scottish poets. First in rank, and hardly inferior to any in genius, was James I., king of Scotland, the author of *The Kingis Quhair*—i.e., *The King's Quire* or book. Before him, in point of time, was Andrew Wyntoun, prior of Lochleven, who wrote a metrical chronicle, the *Orygynale Cronykil*, which was edited so far as it treated of Scottish history—by David Laing in 1795. Another Scottish poet of this century was Henry the Minstrel, commonly called Blind Harry (q.v.), the author of a poem on the life of Sir William Wallace, which in a modernised form was long a favourite in Scotland.

The closing years of this century, and the first half of the next, were distinguished by poets of still higher name. Foremost of these is William Dunbar (q.v.), author of *The Thirissill and the Rois*, *The oldyn Targe*, and many smaller poems, both serious and satirical, of very high merit. The only complete edition of his works is that by Mr David Laing, which was published in 1834. Gawin Douglas (q.v.), a son of the Earl of Angus, and bishop of Dunkeld, was contemporary with Dunbar. He wrote several original poems, but his principal work is the translation in which he first gave 'rude Scotland Irigill's page.' A magnificent edition of Douglas is just being published under the editorship of Mr Laing (Edinburgh: Paterson, 1874). The last remarkable writer of this age is Sir David Lindsay (q.v.), who died in 1555, and whose poetical works were published in 1806 by George Chalmers, and again in 1871 by David Laing. The 16th c. also produced the first Scottish prose-writers. Among these is the anonymous author of *The Complaynt of Scotland*, recently edited by Mr Murray, from whom we have quoted above; and John Bellenden, archdeacon of Moray, the translator of Boecius's *Scotorum Historie*, and of the first five books of Livy.

With Lindsay ceased that succession of poets writing in the Scottish dialect which had continued without interruption from the time of Barbour. It was more than a century and a half before another added his appearance. Most of the scholars of that time wrote in Latin; but for one vernacular prose-work of great merit as a composition, *The History of the Reformation of Religion within the Realme of Scotland*, we are indebted to the leader of the movement, John Knox (q.v.).

We may close our account of this first period by the statement, that down to the period of the reformation every Lowland Scot knew that his language was 'Inglish,' and the only one who did not speak of it as such was Gawin Douglas. The accession of King James to the crown of England was unpropitious to the vernacular literature of Scotland. The parliament still met at Edinburgh, but the capital had ceased to be the residence of a court, and the language began to be looked upon as vulgar dialect of the English. The best authors imposed in the classic English of the south. It was in that language Drummond (q.v.) of Hawthornden wrote his verses, Archbishop Spottiswood (q.v.) and Bishop Burnet their histories, and Archbishop Leighton (q.v.) and Henry Scougal their theological works, so far as they were not in Latin. It might have been expected that the union of the

kingdoms, by which Scotland was deprived of a legislature of her own, would have soon extinguished the cultivation of the native literature; but as a matter of fact, it turned out to be otherwise. There was a strong popular prejudice against the Union, and this roused a deep feeling of nationality, apart from the old religious divisions. At this time appeared the first Scottish poet of true genius since the dark age of the country's literature set in—Allan Ramsay (q.v.), author of *The Gentle Shepherd*, which was published in 1725. Ramsay had also the merit of preserving some of those songs and ballads which have since become so famous, but whose authors are quite unknown. How far these works are the productions of an earlier age, and how far they are the composition of authors living in the 18th c., has been keenly discussed. Reference may be made to *The Romantic Scottish Ballads* of Mr Robert Chambers on the one side, and to *The Lady Wardlaw Heresy* of Mr Norval Clyne on the other.

To the deep attachment to the exiled line of kings cherished by a large party in Scotland, and to the interest awakened by the struggles in which this resulted, we owe the exquisite Jacobite songs.

While these feelings were dying away under the influence of the mild government of George III., the close of the century was made famous by the appearance of the most illustrious of Scottish poets. It is almost needless to say a word of Robert Burns (q.v.). Admired by all ranks, he continues to be the chosen classic of the peasantry of the Scottish Lowlands. It is as an English writer that Sir Walter Scott (q.v.) is famous; but many of his lyrical pieces, and the dialogues in his novels, where the speakers use their own northern tongue, entitle him to be ranked as the last and greatest of Scottish writers.

There is, however, no doubt that in spite of the fine and various manifestation of literary genius in the Scottish dialect during the 18th and 19th centuries, that dialect has for the last 200 years been going through a process of uninterrupted decay. The introduction of southern English as the standard or classic form of speech after the union of the crowns, and still more after the union of the parliaments, slowly but surely ruined the old Anglian tongue of Scotland, till most of its peculiarities disappeared, and a 'jargon' grew up that was neither pure English nor pure Scotch, but of which nevertheless Scotchmen are curiously proud. Mr Murray has happily characterised this jargon in which Ramsay, Ferguson, Burns, Scott, Hogg, and Tannahill wrote as 'fancy Scotch.'

See Craik's *History of English Literature and the English Language* (1864); David Irving's *History of Scottish Poetry* (Edin. 1861); Cosmo Innes' preface to his edition of Barbour's *Brus* (1856); and Murray's Essay in the *Transactions of the Philological Society* (1873).

SCOTTISH MUSIC. Scotland is famed for a class of national airs of a peculiar style and structure, possessing a wild, dignified, strongly marked, and expressive character. They are generally considered to be of great antiquity; the few notes on which the oldest of them turn, and the character of the modulation, lead to the inference, that they originated at a time when the musical scale and musical instruments of the country were in a rude state; but there is a deficiency of evidence regarding their early history. No musical MS. of Scottish airs is now known to exist of an older date than 1627; and we have no knowledge when and by whom the early Scottish melodies were composed, or how long they continued to be handed down traditionally from generation to generation. They may not improbably have been committed to notation in the 15th and 16th centuries; and

disappearance is not wonderful, when we take into account, first, the strong measures resorted to, about 1530, by both civil and ecclesiastical authorities, to put down all ballads reflecting on the Roman Catholic hierarchy, and afterwards the fanatical proscription of music, along with every other innocent amusement, by the Puritans. The most valuable of now existing early collections of Scotch melodies is the Skene MS., in the Advocates' Library, noted down by Sir John Skene of Hallyards about the year 1630. It contains a number of native airs, mixed with some foreign dance-tunes—upwards of a hundred in all. Many of the Scotch melodies differ considerably from the more modern versions, presenting in general a ruder outline; but often exhibiting beauties which the changes which these airs have subsequently undergone have only tended to destroy.

Among the peculiarities which give its character to the music of Scotland, the most prominent is the prevalent omission of the fourth and seventh of the scale, and consequent absence of semitones, giving rise

to such melodic forms as 

or  Passages of this kind

occur in all the airs of Scotland which have any claim to popularity, and form one of their most recognisable features. Another characteristic is the substitution of the descending for the ascending sixth and seventh in the minor scale, as at the beginning of the air called *Adeu, Dundee*, in the Skene MS.—

A very prevalent course of modulation is an alternation between the major key and its relative minor, the melody thus ever keeping true to the diatonic scale of the principal key, without the introduction of accidentals. An air will often begin in the major key, and end in the relative minor, or the reverse. The closing note is by no means necessarily the key-note, a peculiarity especially remarkable in the Highland airs, which, if in a major key, most frequently terminate in the second; if in a minor, on the seventh. Closes are also to be found on the third, fifth, and sixth. The peculiarities of modulation of the music of Scotland have something in common with the modes of ancient ecclesiastical music, to which it may be more correctly said to belong, than to the modern major and minor keys; and the avoidance of the fourth and seventh may have originated in the imperfection of the ancient wind instruments; yet these peculiarities are not to be found in the national airs of other countries where ecclesiastical music may be supposed to have had the same influence, and the early instruments to have been equally imperfect.

Among the more modern printed collections of Scottish melodies with words, the most important are George Thomson's collection, with symphonies and accompaniments by Pleyel, Kozeluch, Haydn, Beethoven, Hummel, and Weber (vols. i.—iv., 1793—1805; vol. v. 1826; and vol. vi. 1841), one distinguishing feature of which was the appearance of Burns's words conjoined with the old melodies of the country; and a more recent collection in 3 vols., published by Messrs Wood & Co., and edited, with historical, biographical, and critical notes, by Mr G. F. Graham (1848—1849).

On the subject of Scottish music generally reference is made to Danney's *Ancient Scottish Melodies from a MS. of the Reign of King James VI., with an Introductory Inquiry Illustrative of the History of the Music of Scotland* (Edin. 1835).

SCOTUS AND SCOTISTS. See DRY-NOTES.

SCOUT, a person sent out in the front or on the flank of an army to observe the force and movements of the enemy. He should be a keen observer and withal fleet of foot, or well mounted.

SCRAP-METAL, a term applied to fragments of any kind of metal which are only of use after remelting. Copper and brass scrap consist of turnings from the lathe, and all useless waste-pieces, whether old or new. They are readily melted. Scrap-tin consists of the chippings and fragments of tinned iron and worn-out tin-cans; these are frequently dipped into hydrofluoric acid, to dissolve off the tin-coating from the inside, and the muric acid so formed is of considerable value for dyeing purposes. Scrap-iron consists of any waste pieces of iron, although the term is usually held to mean malleable iron only; and for these purposes it is particularly valuable, as it is found that a greater strength can be obtained by welding small fragments of iron together, than is possible with large masses, the fibre being much more twisted and interwoven, from the mingling of pieces in every imaginable direction.

SCREAMER (*Palamedea*), a genus of birds of the order *Grallæ*, allied to the *Jacanas* (q. v.). The bill is rather short, conical, curved at the extremity; there is a bare space around the eyes; the tarsus is long; each wing is furnished with two strong spurs. The HORNED S., or KAMICHI (*P. cornuta*), inhabits the swamps in Brazil and Guiana, and feeds on the leaves and seeds of aquatic plants. It is of a blackish-brown colour, nearly as large as a turkey, and has somewhat the appearance of a gallinule. It receives its name from its loud and harsh cry. From the head, a little behind the bill, it rises a long, slender, movable horn, of which the use has been conjectured. The spurs of the wings

Horned Screamer (*Palamedea cornuta*).

are supposed to be useful in defence against snakes and other enemies.—Closely allied to this is the genus *Chauna*, or *Opisthophus*, to which belongs the CHAUNA, or CRESTED S. (*C.* or *O. cincta*). It is native of Brazil and Paraguay, the head of which has no horn, but is adorned with erectile feathers. The plumage is mostly lead-coloured and black. The wings are armed with spurs. It is very tame, and of domestication, and is sometimes reared in flocks of geese and turkeys, to defend them from vultures, being a bold and powerful bird.

SCREEN, in Architecture, an enclosure or protection of wood, stone, or metal work. It is of frequent

SCREW—SCREW PINE.

use in churches, where it shuts off chapels from the nave, separates the nave from the choir, and frequently encloses the choir all round. Such screens are often much ornamented, the lower part being solid, and the upper very often perforated. The Rood-screen (q. v.) is that on which most labour is usually bestowed. In England, many beautifully arched screens in stone, enriched with pinnacles, niches, statues, &c., remain, such as those of York, Lincoln, Durham, &c.; and specimens in wood, arched and painted, are common in parish churches. In France, the screen round the choir is sometimes the subject of beautiful sculptures, as at Amiens and Paris. In Halls (q. v.) there was usually a wooden screen at one end to separate the entrance-hall and a passage from the hall. Over this was a gallery. The term 'Screen of Columns' is also applied to an open detached colonnade.

SCREW, one of the Mechanical Powers (q. v.), is a modification of the Inclined Plane (q. v.), and may be shewn (fig. 1) by wrapping a piece of

Fig. 1.

paper in the form of an inclined plane round a cylinder. In the screw, the spiral line, formed by the length or slope of the plane, is raised up to a ridge, and a lever is attached for the purpose of working it, so that the screw is really a compound machine, combining the lever and the inclined plane. It may be used as an instrument of penetration, as in the auger, gimlet, &c., or as a means of producing pressure, the latter being its most important application as a mechanical power. For this purpose, it is made to work in a 'female

Fig. 2.

screw' or nut (a hollow cylinder grooved on the inside, so as to correspond to the threads of the screw); the nut is then firmly fixed in a massive frame (fig. 2), and the revolution within it of the screw causes the lower extremity of the latter to advance or recede. The principle of the screw's application is the same as that of an inclined plane pushed further and further under a heavy body so as to raise it up. Now in the inclined plane, P , the power or force, is to W , the weight raised or the pressure overcome, as the height of the plane to its base; that is, in the screw, as the distance between two threads is to the circumference of the cylinder. But as the twist is not applied at the circumference of the cylinder directly, but by means of a lever, it follows that the power applied, P , is to W , as the distance of two threads to the circumference described by P at the end of the lever. We see, then, that the power of the screw is increased by diminishing the distance between the threads; but as this cannot be effected without weakening the instrument, there is an evident limit to the increase of power in this way. The power can also be increased by lengthening the lever; but the best mode is that proposed by Mr Hunter (in the *Phil. Trans.* vol. 17), in which are employed two screws of different fineness, the coarser of them hollow and grooved, to act

as a nut for the other. The outer and coarser screw is the one to which the power is applied by a lever, and it is adjusted in the manner before described; the inner is so fastened as to be capable of vertical motion only. When the outer screw is turned so as to move its extremity downwards, the inner screw moves upwards, but not to the same amount; thus, if the outer screw have 6 threads to the inch, and the inner one 7, one turn of the outer screw depresses it $\frac{1}{6}$ th of an inch, but as the inner one rises $\frac{1}{7}$ th of an inch, the whole descent of the point which produces pressure is only $\frac{1}{6} - \frac{1}{7}$, or $\frac{1}{42}$ of an

inch; hence the pressure applied is 7 times greater than could be given by the outer, 6 times greater than could be given by the inner screw, and equal to what would be given by a screw with 42 threads to the inch, with the same power applied. The advantage of Hunter's screw is that the threads may be any thickness, and consequently each screw any strength, we please, provided the difference be small enough. The screw is one of the most powerful of the mechanical powers, but the friction generated by it amounts to about $\frac{1}{4}$ of the force applied.

SCREW-DRIVER, a chisel-shaped tool, used for turning round, and so driving in or drawing out the common joiners' screw-nails, the heads of which have a cleft made to receive the edge of the screw-driver.

SCREW PINE (*Pandanus*), a genus of plants of the natural order *Pandanaceæ*, natives of the tropical parts of the east and of the South Sea Islands. Many of them are remarkable for their adventitious roots, with large cup-like *spongioles*, which their branches send down to the ground, and which serve as props. Their leaves are sword-shaped, with spiny edges, and are spirally arranged in three rows. In general appearance, when unbranched, they resemble gigantic plants of the pine-apple, whence their popular name. *P. odoratissimus* is a widely diffused species; a spreading and branching tree of 25 feet high, much used in India for hedges, although it takes up much ground. In the south of India, it is called the Kalders Bush. It grows readily in a poor soil, and is one of the first plants to appear on newly-formed islands in the Pacific. The male flowers are in long spikes, the female flowers in shorter branches. The flowers are frequently gathered before expanding, and boiled with meat. Their delightful and very powerful fragrance has made the plant a favourite everywhere, and it is the subject of continual allusions in Sanscrit poetry, under the name *Kelaka*. Oil impregnated with the odour of the flowers, and the distilled water of them, are highly esteemed East Indian perfumes. The seeds are eatable; and the fleshy part of the drupes, which grow together in large heads, is eaten in times of scarcity, as is the soft white base of the leaves. The terminal buds are eaten, like those of palms. The spongy and juicy branches are cut into small pieces as food for cattle. The leaves are used for thatching, and for making a kind of umbrella common in India, and their tough longitudinal fibres for making mats and cordage. The roots are spindle-shaped, and are composed of tough fibres; they are therefore split up by basket-makers, and used for tying their work. —More valuable, however, as a fibrous plant is an allied species, *P. sativus* or *P. vacca*, the *VACOA* of Mauritius, which, if permitted, grows to a height of about 30 feet, but from continual cropping of its leaves, is usually dwarfed to six or ten feet. The fibres of its leaves are used for making the *Vacoe bags*, which constitute so considerable an article of

SCREW-PROPELLER.

export from Mauritius, rivalling in cheapness and usefulness the Gunny Bags of India. The leaves are cut every second year, and each plant yields enough to make two large bags. Immediately on being cut off, the leaves are split into fillets, which are nearly an inch broad at the base, but taper to a point, and are three or four feet long. One of these will support a bag of sugar, of about 140 pounds, without breaking. The aerial roots of the *Vacca* are so fibrous as to be used for making paint-brushes for coarse purposes.

SCREW-PROPELLER. This is of the same construction as the common Screw (q. v.), but with the narrow thread exaggerated into a broad, thin

Fig. 1.

plate, and the cylinder diminished to a mere spindle. One complete turn of such a screw is shewn in fig. 1. Now, if a screw of this form were turned round in an unyielding substance, as wood, it would for each turn advance as much as the centre of the blade (or thread) had moved along the spindle in forming the screw, i. e., the distance ab . If, on the other hand, the screw itself were prevented from moving longitudinally, and the piece of wood not fixed, the latter would be compelled to advance along the screw the same distance ab . When the screw is fixed beneath a ship, and made to revolve in the water, the case lies between the two just supposed, the screw moves forward, and with it the ship, and the water in which it has been working moves backward. The backward motion should only be small proportionately, and the ratio between it and the sum of the backward motion of the water and the forward motion of the ship is called the *slip*, which in well-designed vessels has a value of from 0.1 to 0.25.

It is obvious also that on the same spindle there may be more than one blade, provided that all the blades have the same pitch or rate of progression along the spindle (in fig. 1, ab is the *pitch* of the screw). Screws have thus been formed with two, three, four, and six blades or arms, but the form most commonly used is two blades for ships-of-war, and three or four blades in the merchant-service.

If the screw be cut off before attaining the length ab of a whole convolution, as at c , the portion ac will still retain all the properties of the screw. In the earlier attempts, screws were tried of the length of a whole convolution, or even two whole turns; but experiment has since shewn that this length is a disadvantage. The best results are obtained when the sum of the lengths, measured parallel to the centre line of the shaft, of all the blades, is equal to about 0.4 of the pitch. This holds equally good for two, three, or four bladed propellers, so that if n equals the number of blades, then the length of one blade, or ac , would be expressed by the equation $ac = \frac{0.4 ab}{n}$. A four-

bladed screw of this kind, and of a form very generally used in the merchant navy, is shewn in fig. 2.

The following are the technical terms applied to the screw-propeller: The *shaft* is the cylindrical axis on which the screw revolves, and is the medium for communicating to it the power of the steam-

engine; the *blade* is the thread of the screw; the *pitch*, the length of shaft on which the blade would make one complete turn; the *diameter* is the distance

Fig. 2.

between the tips of opposite blades; and the *pitch* is the distance from the front to the back edge of a blade projected upon a fore and aft plane.

The application of the screw to the propulsion of a vessel through the water is not new. In 1802, J. Shorter, an English mechanic, produced motion by its agency; but his discovery was valueless, as the steam-engine had not then been practically applied to navigation. Those who first employed Watt's engine on board ship adopted the paddle-wheel, the success of which turned attention to the screw for nearly thirty years. At length, in 1832, Mr B. Woodcroft patented a screw-propeller with an increasing pitch; and four years later, Mr F. P. Smith patented a screw making two whole turns, which he reduced, in 1839, to one whole turn. In 1837, he and Captain Ericsson, an American inventor, brought the matter practically forward on the Thames, where a small screw-steamer, 45 feet long, 8 feet broad, and of 27 inches draught, towed the *Toronto* of 630 tons against tide at 4½ knots an hour. In 1839, an American gentleman had to the *Robert Stockton* built for him by Messrs Laird, to which he reached America. The British Admiralty, however, refused any support to the new propeller until the success of the *Archimedes*, built in 1839, of 232 tons and 80 horse-power, which was exhibited at the principal ports, rendered opposition no longer possible. The Admiralty, then, as an experiment, constructed the *Rattler*, from the trials of which vessel many valuable data for the screw-propeller have been derived. Meanwhile, in 1833, Mr James Lowe had shewn that the length of the screw should not exceed ¼th of the pitch; and after several successive trials, the screw of the *Rattler* was cut down from 5 feet 9 inches to 1 foot 3 inches. These experiments established the screw as a rival to the paddle-wheel; and its advantage for ship-of-war became incontestable, as, from the entire submergence of the propeller, and consequent lowering of its engines in the ship, the chances of injury from an enemy's shot were reduced almost to nothing. Some of the great steam-companies—notably the Peninsular and Oriental Company—also patronized it, and it was found of great value as an auxiliary to sailing-vessels. The result is that, at this time (1874), its use in the British navy is almost universal, except in cases where want of sufficient depth of water, or other special circumstance, causes the paddle-wheel still to be employed.

Several varieties of screw have been introduced, each finding many supporters. The one which was for many years used in the British navy was invented

SCREW-PROPELLER—SCREW-WRENCH.

by Mr R. Griffiths. In it the blades, in place of rising from a small boss, as in fig. 2, spring from a hollow sphere occupying one-third the screw's diameter. This arrangement was adopted because experiment proved that the central portions of the blades of the ordinary screw absorb about 20 per cent. of the propelling power, while they produce little useful effect, from the circumstance that at that part (especially in screws of a coarse pitch) the blade is nearly in a line with the shaft, and cuts at right angles on the water, causing only disturbance of that portion on which the outer and more powerful end of the blade operates. The lobe, on the other hand, revolves with little action. A further improvement was effected by bending the tips of the blades a little over backwards, so that the face of the blade striking the water was partly convex. The older propellers had blades which increased in width uniformly from boss to tip. These were found to create much vibration in the ship, and the 'leading' corner is therefore rounded away as shewn in fig. 2. This is also done in Griffiths's propeller, but he probably varies the principle to excess in cutting away also the 'following' corner, and so lessening the effective surface of the blade. A propeller invented by Mr Linch, and known by his name, has been lately successfully tried by the Admiralty, and may probably be much used by them in future.

One difficulty in the use of the screw as an auxiliary in sailing-ships is that in a good wind the screw seriously impedes the sailing. To prevent this, various devices are resorted to. In some cases, the screw is disconnected from the shaft, and left to revolve freely; in others, as in most ships of war, it is disconnected and hoisted altogether out of the water by means of an iron framework worked above the screw in a sort of well. Messrs Maudslay have patented a 'feathering-screw,' which, by a simple apparatus, can, when the steam-power is not required, have the blades turned into a line with the ship's keel, and the screw (which must be two-sided) fastened in a vertical position. When thus stowed, the screw is out of danger, and forms no impediment to the ship's progress.

The usual position for the screw is immediately before the stern-post, the shaft on which it revolves running parallel to the keel, into the engine-room. Many vessels have been built, especially by Messrs & W. Dudgeon of London, with two screws, one under each quarter. These have independent action, and as one can therefore be reversed while the other goes ahead, great steering-power is imparted; so much so, that vessels constructed on this principle are said to be able to turn in their own length. For a given power, a twin-screw vessel draws less water, owing to the lessened diameter of the propellers, than an ordinary screw-steamer. As the action of the screw depends on the comparative immobility of the water in which it acts, it is necessary, for the development of its full power, that it should be completely immersed, and that there should be nearly two feet of water above the top of the upper blade. It follows from this that, *ceteris paribus*, the screw-vessel will draw more water than the paddle-steamer; for in large steamers the screw is from 15 to 18 feet in diameter, and in the *Great Eastern* it reaches 24.

It now only remains to notice the comparative advantage of the paddle and screw. Under favourable circumstances, in ships of equal tonnage and power, there is little difference in speed or force. Before the wind, the paddle has a slight advantage; with the wind ahead, the resistance offered by the paddle-boxes transfers the advantage to the screw. Fastened stern to stern, the screw-

ship drags the paddle-ship; but fastened bow to bow, the same result is not found. This is, however, rather to be attributed to the loss of power in a paddle-ship when not in progress (see PADDLE WHEEL), than to any actual superiority of screw. In a long voyage, however, the gain is distinctly with the screw; because the weight of fuel borne at starting sinks the paddles too low in the water, and probably its exhaustion at the end of the voyage deprives them of their proper dip; whereas, with ordinary management, the screw will always be immersed. Again, rolling deprives the paddle of much power; while pitching deprives the screw of its proper matrix; but the balance of loss in tempestuous weather is in favour of the screw. It has been already shewn that in men-of-war the screw is the most useful agent; and as an additional reason may be adduced the clear broadside which it allows for the guns. On the other hand, in point of comfort to the passengers, the advantage lies unquestionably with the paddle; for the rapid revolution of the heavy screw on a shaft extending half the ship's length, produces a continuous and very unpleasant vibration; while the lower position of the engines and screw gives the vessel a deep roll. For lakes and rivers, where the water is smooth and the voyage short, paddles are best, and more especially so when the water becomes often shallow or is choked with weeds, which would soon clog the screw.

In scientific language the motion of a vessel by means of a screw, is said to be due to the forward reaction of the water in which the propeller revolves upon the blades, and through them upon the whole vessel. In order that this useful reaction may bear the largest possible ratio to the work done by the engine, it is essential that the form of the ship aft should be such as will secure that plenty of water shall always have access to the forward side of the screw as the vessel goes along. This has been demonstrated by the experimental alterations in the after-body of the *Dwarf* (1846), and still more strikingly by placing a disc of the same diameter as the propeller in front of it. If the propeller be worked in these circumstances, the vessel will not move forward at all, although the power given out by the engines remains as before.

SCREW-WRENCH, a tool used for grasping the flat sides of the heads of large screws, such as are used in engines and other large works. The heads

Fig. 1.

are usually octagonal laterally, and the wrench is made of two portions like hammers sliding one upon the other (fig. 1), so that screw-heads can be grasped of different sizes, and the handle forms the lever

Fig. 2.

by which they are turned round. The screw-key (fig. 2) is only a more simple kind of wrench, which will only act upon screws of two sizes, fitting the jaws at each end.

SCRIBBLER. See SPINNING.

SCRIBE (Heb. *Sofer*; Gr. *Grammateus*, *Nomodaskalos*), among the Jews, originally a kind of military officer, whose business appears to have been the recruiting and organising of troops, the levying of war-taxes, and the like. At a later period, especially at the time of Christ, it had come to designate a learned man, a doctor of the law. Christ himself recognises them as a legal authority (Matth. xxiii. 2); they were the preservers of traditions, and form a kind of police in the Temple and synagogues, together with the high-priests; and the people revered them, or were expected to reverence them, in an eminent degree. They were to be found all over the country of Palestine, and occupied the rank and profession of both lawyers and theologians. Their public field of action was thus probably threefold: they were either assessors of the Sanhedrim, or public teachers, or administrators and lawyers. Many of these teachers had special class-rooms somewhere in the Temple of Jerusalem, where the pupils destined to the calling of a Rabbi sat at their feet. The calling of a Scribe being gratuitous, it was incumbent upon every one of them to learn and to exercise some trade. Those Scribes who were not eminent enough to rise to the higher branches of their profession, to enter the Sanhedrim, to be practical lawyers, or to hold schools of their own, occupied themselves in copying the Book of the Law or the Prophets, in writing phylacteries, contracts, letters of divorce, and the like. Their social position was naturally in accordance with their talents and their importance. The apostles, not learned enough, for the most part, to be Scribes, are promised to become 'Scribes' of the kingdom of God, &c. See PHARISEES, HALACHA, HAGGADA, MIDRASH, MISHNA, TALMUD.

SCRIBING, in Joinery, fitting the ends of pieces of wood together, so that the fibres may be at right angles, and the end cut away across the fibres.

SCRIP is a certificate (usually about the size and appearance of a bank-note) of a person's share or shares in a joint-stock undertaking. It is issued on the party signing a contract of copartnership, and is retained by him until an act of the legislature, or some other formality, establishes the company, and authorises the opening of regular books for entering the names of shareholders and the transfer of stock. In many instances, scrip is unauthorisedly sold, and made an object of speculation; the party to whom it was assigned, however, remains bound by the contract which he has subscribed, until relieved of his obligations by transfer in the books of the company.

SCROFULA, or SCROPHULA, was, until the last quarter of a century, regarded as consisting essentially of indolent glandular tumours, occurring frequently in the neck, suppurating slowly and imperfectly, and healing with difficulty. Recent pathologists, however, have given a more extended meaning to the word *scrofula*. According to them, it signifies a certain disease or defect of the constitution, in which there is a tendency to the production and deposition of a substance called *tubercle* in various tissues and organs; and tubercle must thus be regarded as the essential element of scrofula. It does not follow, however, that a deposit of tubercle should actually occur in every case of scrofula. The tendency is present, and the absence or presence of the deposit depends upon the extent of the affection, and is determined by various causes.

Mr Paget, one of the most eminent of our living pathologists, very clearly sums up what is generally understood by scrofula in the following paragraph:

'It is a state of constitution distinguished in its measure by peculiarities of appearance even during health, but much more by peculiar liability to certain diseases, including pulmonary phthisis. The chief of these "scrofulous" diseases are various swellings of the lymphatic glands, arising from causes which would be inadequate to produce them in ordinary healthy persons. The swellings are due sometimes to mere enlargement, as from increase of natural structure, sometimes to chronic inflammation, sometimes to an acute inflammation, or abscess, sometimes to tuberculous disease of the glands. But besides these, it is usual to reckon "scrofulous" affections certain chronic inflammations of the joints; slowly progressive "carunculations" of bones; chronic and frequent ulcers on the Cornea, Ophthalmia [q. v.], attended with extreme intolerance of light, but with little effect of the ordinary consequences of inflammation; frequent chronic abscesses; pustules, or other cutaneous eruptions, frequently appearing upon the face; affection of the health or local irritation; habit of swelling and catarrh of the mucous membrane of the nose; habitual swelling of the upper lip. It is obvious that although the above-named forms of disease are often more or less coincident, they are nothing sufficiently in common to justify the general appellation of *scrofulous*. They are certainly not all tuberculous diseases, and hence Mr Paget is of opinion whether the proposal to make *scrofulous* and *scrofulous* commensurate terms is practical, since the former, as generally employed, has a much wider significance than the latter.

The word is derived from the Lat. *scrofula*, it being supposed that this animal was especially liable to tumours such as occur in this disease. The Greek and Arabic names for the disease are similarly derived from the words signifying 'swelling' in these languages. While *scrofula* was the popular name (supposed to be derived from *struo*, to build up) used by Celsus, Pliny, and other Latin writers, the classical name for the disease. The English name, *The King's Evil*, is derived from a long-cherished belief that scrofulous tumours and abscesses could be cured by the royal touch. Multitudes of patients were submitted to this treatment, and as the old historians assert, with perfect success from the time of Edward the Confessor to the reign of Queen Anne. The writer of the article 'Scrofula' in *The English Cyclopædia*, mentions the following historical facts that 'the old Jacobites contended that this power did not descend to Mary, William, or Anne, as they did not possess a full hereditary title, or, in other words, did not reign by divine right. The kings of the house of Brunswick, however, we believe, never put this power to the proof: it was the office for the ceremony which appears in the Liturgy as late as 1719 has been silently omitted. The exiled princes of the house of Stuart were supposed to have inherited this virtue. Cf. the well-known note to the first volume of *History of England*, mentions the case of Colonel Topher Lowel, who, in 1716, went to Avignon, and the court was then held, and received a temporary cure; and when Prince Charles Edward was in Holyroodhouse in October 1745, he, although claiming to be Prince of Wales and regent, presented a female child for the king's evil, who is said to have been perfectly cured.' The practice was introduced by Henry VII. of presenting a patient with a small coin (gold or silver). The accompanying is an engraving of the identical piece presented to Dr Johnson (Lent 1712-13). He was only thirty months old, who was one of the persons touched by Queen Anne.—The French kings also touched for the 'Evil,' the practice being

reced back to Clovis, 481 A. D. On Easter Sunday, 686, Louis XIV. is said to have touched 1600 persons, using the words: *Le roy te touche, Dieu te guerisse* (the king touches thee, may God cure thee). See Chambers's *Book of Days*, i. 82. The

Touch-piece (time of Queen Anne).

terature of this curious subject is somewhat extensive. The reader who wishes to pursue the inquiry further is referred to Tooker's *Charisma, sive Donumunctionis*, &c., 1597; Browne's *Charisma Basilicon*, or *The Royal Gift of Healing Strumæ*, &c., 1684; and Cockett's *Free and Impartial Inquiry into the Antiquity and Efficacy of Touching for the King's Evil*, 1722. The subject is also examined by Bishop Douglas in his *Criterion, or Miracles Examined*, 1754; by Colquhoun, in his *Isis Revelata*, 1836 who attributes the cure to animal magnetism; and Howitt in his *History of the Supernatural in all ages and Nations*, 1863.

Scrofula is a disease of early life, and when it does not exhibit any of its manifestations before the period of maturity it seldom shews itself afterwards.

In all systematic descriptions of this disease, two varieties of the scrofulous habit or diathesis are given, viz., the *sanguine* or *serous*, and the *plegmatic* or *melancholic*. In the *sanguine*, there is a general want of muscular development, the limbs being soft and flabby; the skin is fair and thin; the features are delicate, the rosy hue of the cheeks contrasting strongly with the surrounding paleness; the eyes are gray or blue, and the eyelashes long and silken; the hair fine and light coloured or reddish; and the ends of the fingers broad and expanded, with convex nails bent over them; the intellect is lively and precocious, and there is often considerable beauty. In the *plegmatic* variety the skin is pale or ruddy, dark, and often harsh; the general appearance dull and heavy; the hair dark and coarse; and the mind usually slow and torpid.

Children in whom the scrofulous constitution is strongly marked often present that narrow and projecting form of the chest to which the term 'pigeon-breasted' is commonly given; moreover, the abdomen is enlarged, the limbs wasted, and the circulation languid, in consequence of which they are specially liable to chilblains. The digestive organs are so commonly affected—as is evidenced by irregular action of the bowels, fetid breath and evacuations, furred tongue, capricious appetite, &c.—that, as the opinion of the late Dr Todd, 'strumous dyspepsia presents a more characteristic feature of this habit of body than any physiognomical portrait that has been drawn of it.' In the great majority of cases the scrofulous disposition is hereditary; indeed, there is no disease which is nearly so often transmitted from parent to offspring as scrofula. There is, however, scarcely any doubt that it may be acquired under the action of various unfavourable exciting causes, which may be ranked together 'as causes of debility.' Amongst them may be especially noticed (1.) Insufficient and improper food; (2.)

Impure air; (3.) Insufficient exposure to direct sunlight; (4.) Exposure to wet and cold, and to sudden changes of temperature, especially if the clothing be insufficient; (5.) Excessive and continued fatigue, whether bodily or mental; and (6.) Intense and prolonged anxiety or mental depression.

We shall first lay down the general principles of treatment to be adopted with the view of improving the health in the case of a person presenting either merely the general indications of a scrofulous habit of body, or some of its local manifestations, and we shall then conclude with a brief notice of a few of those particular forms of the disease which most frequently come under the attention of the medical practitioner.

The diet should be nutritious and sufficiently abundant, and animal food should be given at least twice daily. Dishes containing eggs and milk may usually be taken with advantage. If the patient is not very young, a little bitter ale taken at an early dinner will often promote digestion; if, however, it causes flushing or much sleepiness, it must be discontinued. A mother with scrofula should always provide a healthy wet-nurse for her child, as suckling in such a case is injurious both to parent and offspring. Flannel should always (both in summer and winter) be worn next the skin during the day, and the clothing must always be sufficient to keep the extremities warm. Constant residence in pure and dry air should be enforced as far as possible. Unfortunately, the climate of Great Britain is by no means favourable to those possessing the scrofulous habit, and it is often very difficult for the physician to decide as to the choice of the most suitable residence. On this subject, Mr Savory, in his essay on 'Scrofula' in Holmes's *System of Surgery*, vol. i., 1860, remarks that 'it is surely a mistake to suppose that a warm climate is the best adapted to all cases of scrofula. It is doubtless so in the great majority in which the disease [in the form of pulmonary consumption] is far advanced; but in many cases at an earlier stage, its further development is more satisfactorily arrested and the general health improved by a more bracing air. Children with tuberculous glands, but whose general health appears otherwise tolerably good, would perhaps profit less by transportation to Madeira or Egypt than by residence in the south-west coast of England, where the atmospheric changes are less frequent and sudden than in other parts of the kingdom, and the winter is comparatively mild. Delicacy of constitution is sometimes increased, and mischief encouraged, by dread of exposure.' Free exercise of the muscles and lungs in the open air should be insisted on in fine weather, and if this cannot be taken, the best substitute is friction over the surface of the body with the flesh-brush. Patients who can bear cold sea-bathing during the summer and autumn months will derive great advantage from it; but if a short immersion is not rapidly followed by a genial glow after drying the skin, such bathing is injurious, in which case warm salt-baths will be found useful. Too much stress cannot be laid upon the fact that in the case of children the mind should be cheerfully occupied, but not overtasked. The medicines most esteemed in the treatment of scrofula are iodine and its compounds, the salts of iron, bark, sarsaparilla, the alkalies and mineral acids, and, above all, cod-liver oil. As the choice of the individual remedy must be left to the physician, we will merely remark that iodine and iron may often be advantageously prescribed together either in the form of the syrup of the iodide of iron, or of a well-known French preparation known as Blancard's Iodide of Iron Pills; and that

to derive full benefit from cod-liver oil, it must be taken for a long time. As Mr Savory remarks, the oil should be regarded as an article of diet rather than a medicine. A tablespoonful may be considered as a full dose for an adult; but this quantity should be gradually arrived at, the dose commencing with a teaspoonful. It is most easily taken when floating on a mixture of orange wine, or some other pleasant bitter fluid, with water. The lightest and clearest oil is probably the best, and in cold weather it should be slightly warmed before it is taken, for it is thus rendered more liquid and more easily swallowed. If what are commonly known as 'bilious symptoms' supervene, the use of the oil should be suspended for a couple of days, and a few gentle aperients should be prescribed.

Excluding pulmonary consumption, in which the leading pathological feature is the deposit of scrofulous matter or tubercle in the lungs, one of the forms of scrofula which most frequently presents itself is in the *lymphatic glands*, especially of the neck. The gland or glands may first become enlarged, either from an attack of acute inflammation, or from an indolent and painless deposit of tubercle. They may remain in this state either stationary or slowly enlarging for years, till from some accidental local irritation, or from some constitutional disturbance, they inflame and suppurate. After the discharge of the matter, the ulcerated skin usually heals with an ugly puckered cicatrix, which generally remains as a disfiguring mark through life. The local treatment consists in attempting to disperse the tumour, if it is hard and painless, by painting it with tincture of iodine, or by the application of iodine ointment. If it is soft, and likely to suppurate, the process may be facilitated by the application of warm water dressing or emollient poultices. When there is undoubted fluctuation, indicating the presence of pus or matter, it is usually regarded as the best practice to open the abscess with a narrow-bladed bistoury; but some surgeons still prefer allowing the matter to make its own way to the surface. The necessary internal treatment is that which has been already described. The skin, especially behind the ears, about the mouth, nostrils, and eyelids, and on the scalp, is liable to pustular diseases of a scrofulous origin. The free use of soap and water, followed by the application of black wash or zinc ointment, and proper constitutional treatment, will generally effect a cure, except in the horrible form of scrofulous ulceration of the skin of the face known as *Lupus* (q. v.). Amongst other well-known and very serious scrofulous affections must be mentioned *Acute Hydrocephalus* and *Mesenteric Disease*, to which special articles are devoted. There is a peculiar and very intractable form of ulceration known as the *scrofulous ulcer*, which will be noticed in the article on *ULCERS*. The physical, chemical, and microscopical characters of the peculiar morbid deposit, to which reference has frequently been made in this article, will be found under the head of *TUBERCLE* and *TUBERCULOSIS*.

SCROFULOUS or Tuberculous Diseases are common amongst cattle, sheep, and pigs. In early life the tubercle is laid down in the mesenteric glands, and occasionally about the joints. Along the exposed eastern coasts of Britain, scrofulous swellings are also met with about the head and neck; in some of the great grazing districts, the mucous membrane of the bowels is affected, constituting dysentery; but, as in man, the lungs are the most common site of tubercle, which here gives rise to pulmonary consumption. Scrofula in all its forms is hereditary, hence animals with any such taint should be rejected as breeding stock. It is induced and fostered by 'breeding in and in.' It may be

developed, and is always aggravated, by debilitating influences, such as bad food, or exposure to wet and cold. Prevention is insured by breeding only from healthy vigorous parents, and allowing the stock all times adequate food and shelter.

SCROLL, an ornament of very common use in all styles of architecture. It consists of a band arranged in convolutions, like the end of a piece of paper rolled up. The Greeks used it in their Doric and Corinthian Styles (q. v.); the Romans in the Composite; and in mediæval architecture, and in styles which closely copy nature, it is of constant occurrence as in nature itself.

SCROPHULARIACEÆ, or **SCROPHULARIÆ**, a natural order of exogenous plants consisting chiefly of herbaceous and half-herbaceous plants. The calyx is inferior, persistent, and divided into five (sometimes four) unequal divisions. The corolla is monopetalous, more or less irregular, and two-lipped, exhibiting great variety of form; it has five (sometimes four) segments. The stamens are usually four, two long and two short, sometimes two, rarely five. The ovary is 2-lobed with many ovules; the style simple, the stigma generally 2-lobed. The lobes of the stigma sometimes display much irritability. The fruit is a capsule, or rarely a berry.—This order is one of the large ones, containing almost 2000 known species which are distributed over the whole world, both in cold and warm climates. Acridity and bitterness are prevalent characteristics, and many species are poisonous. Some are root parasites. Some are admired and cultivated for their flowers; some are used medicinally. *Digitalis* or Foxglove, *Calceola*, *Mimulus*, Mullein, *Antirrhinum* or Snap-dragon, *Gratiola*, *Scrophularia* or Figwort, *Veronica*, *Speedwell*, and *Euphrasia* or Eyebright, are familiar examples. Very different from these humble herbaceous plants is *Paulownia imperialis*, a Japanese tree, 30 to 40 feet high, with trunk two or three feet in diameter, and flowers in panicles, about as large as those of the Common Foxglove.

SCRUPLE (Lat. *scrupulum*, *scripulum*, or *ascripulum*) was the lowest denomination of weight among the Romans, and with them denoted the 24th part of an ounce (*uncia*), or the 288th of a pound. As a measure of surface it was also the 24th part of the *uncia*, and the 288th of an acre (*jugalum*), seeming, in fact, to be the 24th of the 12th part of any unit. In later Roman times it became the name of the 60th part of an hour, and corresponded to our 'minute.' The 'minute' being the 60th part of a minute was called a *scrupulum secundum* (whence the derivation of our 'second'), the 60th part of this a *scrupulum tertium*, and so on. Lexicographers define 'scrupulum' to be a small pebble, such as would be likely to come in its way between the sandal and the foot, whence the use of the term to signify a small difficulty or objection.—The term at the present time has no denomination in that modification of Troy weight which is used by apothecaries; it contains 20 grains, is the third part of a drachm, the 24th part of an ounce, and the 288th of a Troy pound.

SCUDERY, MADELINE DE, a once famous French novelist, was born at Havre in 1694. Left an orphan at the age of six, she was brought up with a brother named Georges, was educated by one of her uncles. While still young she left Normandy for Paris, was admitted to the Hôtel Rambouillet (see RAMBOUILLET), and became one of the oracles of the brilliant literary circle that assembled there. It was in this fashionable shewy circle that Mademoiselle S. gathered up an immense fund of watery sentimentalism, which

allantries, 'polished' conversation, dull ceremonial accidents, affectations of moral purism, &c., which make up the tedious contents of her romances—*romans de longue haleine* (long-winded romances), they have been felicitously nicknamed. Their popularity for a brief period was painfully wide. Everybody with the slightest pretensions to 'taste,' except the Port-royalists, Bossuet, and a few critics of the stricter sort, professed a boundless admiration for them. The bishops in general—as Camus, Mascaron, Huet, Godeau, Fléchier, Massillon—were enraptured, and studied the stately trash with an ardour that considerably diminishes our respect for their understanding. When the troubles of the Fronde had broken up the gatherings at the hôtel Rambouillet, Mademoiselle S. organised a literary circle of her own, which met every Saturday at her house in the Rue de Beauce. These 'Saturdays' began very well; but gradually they degenerated, and became ridiculous—pedantic and blue-ockingish they had been from the very first. Nothing further in Mademoiselle S.'s life calls for notice. She died at Paris, 2d June 1701, at the advanced age of 94, honoured and respected to the end; and it is but fair to admit that she seems to have been worthy of the regard in which she was held, being herself a perfect pattern of those watery virtues and superfine excellences of demeanour that she loved to depict. Her principal works (never again to be read in this world) are: *Ibrahim, ou l'illustre Bassa* (Par. 4 vols. 1641); *Artamène, ou le grand Cyrus* (Par. 10 vols. 1649—1653); *Clélie, l'histoire Romaine* (Par. 10 vols. 1656); *Almahide, ou l'esclave Reine* (Par. 8 vols. 1660); *Les Femmes illustres, ou les Harangues Héroïques* (Par. 1665); 3 vols. of *Conversations Nouvelles, Conversations Morales, et Entretiens de Morale* (1680—1692); *saides Lettres, et Poésies légères, &c.*—See Victor Cousin's *La Société Française au Dix-septième Siècle*.

SCUDO (Ital. shield), an Italian silver coin, corresponding to the Spanish *piastre* (q. v.), the American dollar (q. v.), and the English crown (q. v.). It was so called from its bearing the heraldic shield of the prince by whose authority it was struck, and differed in value in the different states of Italy. In Rome, where it is called the *scudo Romano* or *scudo nuovo*, it is equal to 4s. 3d. sterling; and is subdivided into 10 *paoli* or 100 *bajocchi*. The Venetian *scudo*, or *scudo della pace*, was of higher value than the Roman one; while, on the other hand, the old *scudi* of Bologna, Genoa, and Modena are inferior to it in value. *Scudi* are now gradually disappearing from the provinces of the Kingdom of Italy before the new decimal coinage, but the name is sometimes given to the piece of 5 lire, equivalent to a 5 franc piece of the French coinage. *Scudi* of gold were also struck at Rome, the *scudo d'oro* being equivalent to 10 *scudi di argento*. See *PIASTRE*.

SCULL, SCULLING. A scull differs from an oar in size only. It is shorter, and less heavy. A man can only manage one oar; but he can pull with a pair of sculls, the ends of which lap over very little, or else do not meet within the boat.

Sculling has two senses, a river sense and a sea sense. In its freshwater acceptation, sculling is the act of propelling a boat by means of sculls in pairs. Among seafaring men, however, to scull is to drive a boat onward with one oar, worked like a screw over the stern.

SCULPTURE, the process of graving or cutting hard materials; from the Lat. *sculpo*, in Gr. *glypho*. Its common application is to artistic carving or cutting. Sculpture is the art of expressing ideas or images in solid materials. In this sense processes

which do not, strictly speaking, involve the cutting of hard substances are included in the term. Sculpture, as an art, includes the moulding of soft materials as well. Clay, and even wax, have been in all ages of the art employed, sometimes for the purpose of sketches or models for reproduction in marble or metal, sometimes as the material of the finished work. The art of sculpture is as old as any that has been handed down to us. The Scriptures allude to the working of brass and other metals in the beginning of human society, and we read of the images of Laban carried off by his daughter. The great nations of antiquity all practised it, though only Nineveh and Egypt have left us anything like a fair representation of the state of the art in those early times. From the nature of this art its productions have proved more durable than those of painting, and have come down to us in more numerous instances even than works of architecture. While the latter have been destroyed, and their materials used up, works of sculpture, being smaller, have remained buried, and from time to time have been reproduced for the instruction and enjoyment of modern nations.

As an art, or means of recording facts and representing ideas, sculpture has many disadvantages as compared with painting, neither colour nor picturesque backgrounds being properly admissible in sculpture. To this rule, however, we shall find exceptions in the works of Ghiberti in the 15th century.

Sculptures are distinguished by different terms, according to the nature and completeness of the work. Groups or figures completely represented are said to be 'in the round.' Those only partially detached from the mass or background are said to be 'in relief.' This, again, is called 'high' or 'low relief,' according as the figure stands fully or slightly above the mass behind it. The ancient Egyptians employed another kind of relief, their figures being sunk below the surface, and only the prominent portions remaining level with it. In this case the background or unoccupied space is not cut away, but the figures are worked downwards into it. Another process is called 'intaglio,' the whole figure being regularly designed and moulded, but 'cut into the material and inverted. This is usually applied to the making of gems and seals. Another sculptural process is that used in the treatment of metals. As metals are both harder than stone and more valuable, it is not possible to cut or grave works out of masses of metal as is done in stone or gems. The metal is fused by heat, and the form is given it while in that state. This is done by first forming or moulding the design in clay or other soft material. Round the model thus formed, a mould is formed of sand, which is prepared and pressed round it in a wet state till it takes the complete form of the model, which is then removed, and the liquefied metal poured in. It takes the exact shape of the model by this means. These are said to be 'cast,' because of the casting of the liquid metal into the mould. Other processes, however, have, in the finer works, to be applied. The metal retains the rough surface of the sand in which it has chilled. It is therefore worked over with a graving tool, to give it a final surface, and express every delicacy of form intended by the artist. In some cases this 'engraving' is in the form of ornamental design, such as dress, &c. Sometimes the whole design is engraved without any previous casting. In this case the metal has had its form given by 'hammering' or 'beating.' The metal, hot in the case of iron or bronze, or cold in the case of silver and gold, softer metals, is beaten on the anvil into its form. A coarser and deeper method of engraving is called

'chasing,' where deeper sinkings and bolder prominence are given to the different parts of the design.

Of moulding we have already spoken. We may now remark on the materials in use for these various purposes. In sculpturing, or cutting designs or figures, we generally find marbles have been employed; the most famous having been the 'Parian,' from the Isle of Paros, and the Pentelic, from the mountain of that name in Attica. Besides these, the ancients used numerous marbles—white, and latterly coloured: the late classical sculptors sometimes employing both white and black, or coloured, in lumps on the same work, the coloured marble being used for the dress or hair as it might be. The Egyptians, besides the use of these materials, and various kinds of fine and coarse-grained stone, employed porphyry, purple and black, an exceedingly hard and difficult material to handle. The modern sculptors have used the white marble of Carrara in Italy, an excellent material, but liable to veins and discolorations, which are unfavourable to the art. 'Terra Cotta,' or burnt clay, was extensively in use both in ancient and modern times; the clay being moulded to the utmost delicacy while soft, and then baked to a red colour. Singularly fine reliefs remain to us from the Etruscans and Greeks, as well as from Egypt and elsewhere, as may be seen in the British Museum. It has also been extensively used in modern times. The Egyptians modelled little figures in porcelain clay, and coloured and enamelled them after the fashion of porcelain, and vast numbers of such are in most of our museums. The word 'toreutic,' from the Greek word *toreuo*, to pierce or bore, is usually applied to sculpture in metal. For this the metal most appropriate, and most generally used both in ancient and modern times, is 'bronze,' a mixture of copper and tin. It is also known as 'brass.' Other metals, in small quantities, were also introduced, and various kinds of bronze have resulted from this variety, as well as from the proportions of the two principal metals, the method of fusion, &c. Egina, Delos, and Corinth made different kinds of bronze, each of excellent quality. Besides this favourite metal, gold, silver, copper, and even lead, and mixtures of lead and tin, 'pewter,' have been used for artistic sculpture. In the celebrated period of Greek sculpture, gold and ivory were used together. These statues, two of which were made by Phidias, were called 'chryselephantine'—that is, of gold and ivory.

The ordinary modes of proceeding in sculpture have been very various; whether the more celebrated sculptors of ancient times cut out their designs at once without the previous rehearsal of a model, we do not know. It is, however, very probable. The Egyptian bas-reliefs may still be seen in some of their tombs, lined out, and corrected afterwards by a master's hand previous to execution. Michael Angelo, the most powerful of modern sculptors, is known to have worked many of his statues, without the use of any model, out of the blocks. Florence, and the Louvre (Paris), contain marble sketches or unfinished figures thus roughed out. The length and size of the chisel-marks shew how boldly this great master went to work to within $\frac{1}{4}$ th of an inch of his final surface. As, however, there can be no putting on of any of the substance of stone once reduced by inadvertence, the artist commonly makes his sketch or design, in small, in clay. This is subsequently enlarged, and then studied from 'the life'; that is, men, horses, draperies, &c., the most suitable to the artist's present purpose are selected, and with these before him, he corrects his design and perfects it while the material is soft. A mould is then taken, as in the case already described, and with a plaster instead of a metal cast before him,

the artist proceeds to work on his marble. The cast being placed on one block, and the marble on another, precisely similar, workmen proceed to place a needle, or a measuring-rod, the rod resting against the marble, till it touches a point of the cast. The needle is then applied to the block on which the marble stands, and this is bored into till the needle touches it as it did the cast. In this way the distance of the various surfaces of the future figure from the outside of the unshaped marble are ascertained, and the workmen rough out the figure down to the measurements. The sculptor then gives the fine and delicate touches that finish it, himself. Finally it is brought smooth with pumice-stone or tripoli. Michael Angelo and some of the ancients actually polished their statues. This, however, is generally objected to, as the sharp points of reflected light injure the general effect of the form.

We must notice one other question relative to sculpture before proceeding to a short review of the art historically, that is colour. The ancients—the Egyptians, Ninevites, and others—did colour their statues, intending, probably, to do so up to the present time; that is, to a direct imitation. The Greeks employed colour on their statues, certainly on the architecture. To what extent they coloured their statues, it is not very easy to determine. For indeed, time has so altered, and partly so obliterated the colouring material, that we can only form an approximate judgment. It seems probable that the colouring was conventional, that is, that colour was used to add to the splendour and distant effect of the work, rather than to attempt any positive imitation of real life. A head in the Elgin Room of the British Museum has been coloured, the hair red. The eyes are completely cut out, so as to shew dark and shadowy hollows, even with the face coloured. Gilding, too, was used for hair. Colour was extensively used in the earlier ages. Many, if not most, interior sculptures were coloured during that period. Quite in our days Mr Gibson has coloured female statues, but open to doubt whether they can be called successful as far as the colour goes. Other means, however, were used to give colour in late classic times. We may see in the Vatican, where a bust has both enamelled eyes and black eyelashes painted into the marble. To the mixture of marbles to obtain the effect of colour we have already alluded.

Speaking of sculpture generally, we may say that a great deal has come down to us. Of the work known, that of Phidias, our readers will find notices under the head of the *ELGIN MARBLES*. The majority of portable works are statues. Of these some calculations reckon as many as 60,000 of kind and another.

Fragments of these have various terms applied to them. 'Busts' are heads, or heads and chests. 'torso' is a figure without head or limbs. There are perhaps fragments. Horace, however, is supposed to allude to a recognised form of such sculpture in the words '*mediam minerat*.' Statues are called 'terminal' when they consist of a head only made out, the body being represented by a square post. These were set up as boundary marks, to invoke favourite deities for the prosperity, and hence the name 'terminal.'

We now proceed to a very summary survey of the history of sculpture. We have seen that ancient nations, both of profane and sacred sculpture, were well used to sculpture. Of these, the Egyptian and the Ninevite are best known. The Egyptian sculpture goes back as far as 1700, or even earlier, in the case of the Pyramids, to 2000 years before Christ (Gardner Wilkinson, *Ancient Egyptians*). The sculptured the human form, the Egyptians were

most knowledge and refinement; both were restricted by religious traditions from arriving at a full representation of the human form; both used mixed forms of man-headed bulls, or man-headed ram-headed lions. Usually these were colossal. The Egyptians, besides this, covered the walls of their sepulchres and temples with spirited and simply detailed historical representations.

The next great nation of whose productions we judge was the Etruscan. They were of Greek origin. There is a great oriental influence or character in their work. It is also to some extent conventional, but often full of sublimity, and the figure quite correct in outline. This also is illustrated by their pottery, covered with figure designs, of which great abundance has been excavated in various parts of Italy. All these schools, including the Etruscan, are stiff and dry in execution—that is, wanting in the ease, fulness, and movement of the human form. They are called 'archaic,' meaning that term unformed and undeveloped, belonging to an age unacquainted with technical knowledge.

Beginning with the early Egyptian times, this period, called Archaic, may be concluded with the rise of the Etruscans, and brings us down to about 500 B.C. From this time a rapid growth in the art took place; schools were formed in the great cities of Greece, Sicily, Egina, and Corinth; and the school of Callon, Onatas, Glaucias, and other names, culminating in Ageladas of Argos. These were sculptured on a colossal scale, and we have ready alluded to the bronze for which the Greeks had long been famous. These schools produced the famous works known as the Egina marbles, found in 1812, as well as those of Selinus, Sicily. Casts of the former may be seen in the British Museum. The originals are at Munich.

The great period of sculpture began about 484, when Phidias was born. Ageladas was his master, also of Polyclethus and Myron, of whose works copies are now in the Vatican and elsewhere, made by Greek artists in the times of the Roman empire. Of the great work of Phidias we will not here say, as it is described elsewhere. Pericles did much to encourage the arts both of sculpture and painting.

For a century and a half, or for two, sculpture continued very slowly to decline. This great school ended in Praxiteles, a sculptor of consummate powers. He carried the representation of the human form further than Phidias and his scholars, and draperies in his hands lost their severer character, and clung to the rounded limbs, which they no longer concealed. His work may be seen in the statues of the Nike Apteros, or sculptures of the temple of unwinged Victory, in the British and other museums. He is said to have been the first to represent the female form quite nude, and to have contributed by such sculptures to the enervation and gradual sensualising of the art.

During the 5th and 4th centuries B.C., we have Scopas of Paros; Alcamenes of Athens; Scopas, the author of the famous Niobe group now at Florence; Lysippus of Sicily, the favourite of Alexander; Chares, the author of the famous Cleopatra of Rhodes; Agasias, who sculptured the Fighting Gladiator; Glycon of the Farnese Hercules; and many others.

The Roman conquest of Corinth under Mummius in the 2d c., and afterwards of Athens, brought to an end. Thenceforth, Greek artists were found all over the Roman empire, and the famous works of these former sculptors were produced by them for their new masters. The Roman sculpture, indeed, is included in this phase of Greek art—the last remarkable work that we

shall notice of classic times being the famous column of Trajan, in the early part of the 2d c. A.D. This is, in fact, a tower over 100 feet high, of white marble, entirely covered with bas-reliefs representing the Dacian wars of Trajan. We here see the expiring effort of classic art. Skilful and correct as the design is, it is, as a whole, graceless, stiff, and without beauty, compared with the old work.

Constantine, in the 4th c. of our era, carried off to Byzantium, his new seat of government, all the sculpture he could remove.

The art revived in Italy. As early as the 10th c., sculpture exhibited both design and grandeur, though wholly different from that of older times. Absolute freedom from old conventionalities, vigour, dignity, and childlike freshness of mind, distinguishes modern sculpture down to the 15th century. The most noted names we will mention here are those of Niccolo of Pisa, in the 13th c., who executed the bas-reliefs at Orvieto; after him, his son Giovanni. Andrea Pisano made one of the bronze gates of the baptistery of Florence. Ghiberti, the author of the more famous doors of the same baptistery, is next to be named; then Donato di Betto Bardi, or Donatello. Some of his works are in the church of Orsan Michele, which the famous Orcagna, sculptor, painter, and architect, had built and decorated.

We begin the next period with Verocchio, in the 15th c., and the more famous Michael Angelo in the 16th. A host of great names followed: Cellini, Torregiano (who made the monument of Henry VII. at Westminster), Della Porta, Giovanni di Bologna, and Luca della Robbia, who also worked in enamelled terra-cotta on a large scale. These are Italian names. We may add Jean Goujon and Germain Pilon in France. In our own country, splendid medieval works are to be seen in the noble sculptures of Wells' Cathedral, and of that of Lincoln, coeval with those of the Pisani. Cibber, who sculptured in England, was a Dane. Thorwaldsen, a native of Iceland; Canova, an Italian; and, lastly, Flaxman, bring us down to our own days. Of the latter, the finest work is perhaps the Wellington Shield, after the Homeric description of that of Achilles. See the works of Winckelmann, and Kugler, and Westmacott's *Handbook of Sculpture*.

SCULPTURED STONES. In Norway, Denmark, the Isle of Man, Wales, Ireland, and Scotland, a class of monuments is to be found decorated with rude sculpture, and belonging to the early periods of Christianity—sometimes, indeed, shewing the symbols of paganism in conjunction with those of Christianity. By far the most remarkable stones of this description are those found in Scotland, which, with some points common to them with the rest, possess the distinguishing feature of a class of characters or symbols of mysterious origin, whose meaning yet remains an enigma to antiquaries, and which yet recur with such constancy in different combinations, that it is impossible to suppose their form to be the work of chance. Along with these symbols the figure of the cross is often found on one side. Neither in Ireland, in Wales, nor anywhere else, are the symbols in question to be met with. These monuments all occur within a circumscribed part of Scotland. None are to be found either within the ancient Dalriada, or south of the Forth; their limit seems to be the eastern lowlands from Dunrobin to Largo Law, or the part of Scotland inhabited by the Pictish race. From 150 to 200 of them are known to exist. The most interesting as well as the most numerous specimens are in Strathmore, at Glammis, Meigle, and Aberlemno. Among the various theories which have been formed regarding these stones,

accidentally acquired great notoriety in connection with the English army during the Russian War (1854—1856), when the enormous barracks built by Sultan Mahmud, on the southern outskirts of the town, were occupied as barracks and hospital by the English troops, and formed the scene of Miss Nightingale's labours. A little to the south of the General Hospital, on the cliffs bordering the Sea of Marmora, is the densely-filled English burial-ground, where Baron Marochetti's monument in honour of the troops has lately been erected.—S. is a place of considerable traffic, and is the rendezvous and starting-point of caravans and travellers trading with the interior of Asia. It occupies the site of the ancient *Chrysopolis*; and about two miles to the south, lies the village of Kadiköi, the ancient *Chalcedon*.

SCUTARI (Turkish *Iskandere*, the anc. *Scodra*), a considerable town of European Turkey, in Northern Albania, capital of a sanjak of the same name, situated at the southern end of the Lake of Scutari, at the point where the Bojana, issuing from it, is joined by the Drinassi. The lake is about 20 miles long, and abounds in fish. S. is a fortified town, with a citadel on a commanding height. It has manufactories of arms and cotton goods, a bazaar, and yards for building coasting-vessels. It carries on a considerable trade. The population is estimated at about 40,000, of whom about one half are Roman Catholics.

SCUTCHEON, in Carpentry, is the small metal plate used to form the protection and ornament to the keyhole for locks; it is usually of brass, but in ornamental cabinet-work, is often of ivory, mother of pearl, &c. See SHIELD.

SCYLLA AND CHARYBDIS. Scylla (Gr. *Skul-laion*), a rocky cape on the west coast of South Italy, jutting out boldly into the sea so as to form a small peninsula just at the northern entrance to the Straits of Messina. About the beginning of the 5th c. (B.C.), a fort was built upon the rock (which is about 200 feet high, and much hollowed out below by the action of the waves), and in course of time a small town grew up, straggling down the slopes towards the sea. The navigation at this place was looked upon by the ancients as attended with immense danger, which, however, seems to have been much exaggerated, for at the present day the risk is not more than attends the doubling of any ordinary cape. The rock, according to the Homeric legend, was the abode of a monster called Scylla, possessing 12 feet, 6 long necks and mouths, each with three rows of sharp teeth, and who barked like a dog. There are other accounts of Scylla, one of which represents her as having once been a beautiful maiden, beloved by the sea-god Glaucus, but who, by the jealousy of Circe, was changed into a monster having the upper part of the body that of a woman, while the lower part consisted of the tail of a fish or serpent surrounded by dogs. The modern Scylla or Sciglio is a fortified town in the province of Reggio-Calabria, having large silk-works, the population being upwards of 7400, mostly seafaring people.

Charybdis (modern name *Galofaro*), is a celebrated whirlpool in the Straits of Messina, nearly opposite the entrance to the harbour of Messina in Sicily, and in ancient writings always mentioned in conjunction with Scylla. The navigation of this whirlpool is, even at the present day, considered to be very dangerous, and must have been exceedingly so to the open ships of the ancients. A modern writer describes it as being 'an agitated water of from 70 to 90 fathoms in depth, circling in quick eddies.' Homer places it immediately opposite to Scylla,

probably taking advantage of the poet's love to exaggerate the danger of the navigation, and it is not improbable that the whirlpool may have changed its situation since his days. The rock connected with it is, that under a large rock which grew out of a rock opposite Scylla, lived the monster Charybdis, who thrice every day drew down the water of the sea, and thrice threw it again.

SCYTHE. See REAPING.

SCYTHIA, a name employed in ancient times to denote a vast, indefinite, and almost boundless territory north and east of the Black Sea, the Caspian, and the Sea of Aral. But the term is so much *geographical* as *ethnological*, and of little interest attaching to the barren catalogue of nations, which we meet with in the works of ancient writers, springs from the hope of connecting it with a recognised race of modern times. It is argued—successfully, as it appears to us—Scythians being the ancestors of the Huns, and maintains their central and primitive position have been Independent Tartary, whence they passed west round the Caspian into Russia, Transylvania, and perhaps even Eastern Hungary. Niebuhr and Neumann favour the hypothesis of a Migration for the Scythians; while others regard them as Finns or Circassians. In their mode of life they were mainly nomadic and pastoral, though we read of some trans-Danubian and Eastern Scythians that followed agriculture. Many of them were *Hippomolgi* ('mare-milkers').

SEA, in its general signification, denotes a large expanse of salt water which covers the depressed portion of the earth's surface, and each hollow and rift to a certain uniformity, completing as far as possible the sphere of the globe, and divides its surface into vast and innumerable smaller portions—the Oceans of the World and their islands. This immense water is not distributed with the least regularity, but here forms a huge basin, and becomes a long and tortuous inlet or strait, narrows or widens as the configuration of the surface on each side permits; nor is it distributed symmetrically to the earth's axis of rotation, the hemisphere of which the south-west of England is the centre or pole contains less of the land-surface, if we except the small portion of South America, south of the equator, Australia, New Zealand, the most of the Indian Islands, and the land around the Cape (of unknown extent). The other hemisphere, with these exceptions, wholly water. From the irregular distribution of the sea over the earth's surface, and from the specific gravity of the water being about $\frac{1}{40}$ th of that of the land, it follows that the centre of gravity of the globe does not correspond accurately to the centre of figure. The extent of sea-surface is estimated at 144,712,850 English sq. m. or $\frac{1}{3}$ ths of the whole of the earth's surface. A mass, on the supposition of an average depth of 1000 miles, is about $\frac{1}{1000}$ th of that of the whole globe; such estimates, however, can be considered as only rough approximations. One of the remarkable features of the sea is its continuity or oneness; for in spite of the fact, that there are large stretches of salt-water, as the Sea of Black, Mediterranean, and Baltic Sea, the Gulf of Mexico, and others, have barely avoided being detached lakes, very few such are found on the earth's surface; and with the exception of the Caspian and Aral Seas, they are of small extent.

Composition, Specific Gravity, and Temperature.

Sea.—The ocean consists of salt water, and from continual motion, under the influence of currents and waves, preserves, generally speaking, uniform fitness. Under special circumstances, however, and the saltness increased, as by the excess of evaporation over the fresh-water influx in the Mediterranean and Red Seas, and about the northern and southern limits of the tropical belt; and reversed, by the contrary cause, in the Sea of Azov, Black Sea, Baltic Sea, and in the polar regions. See *TRADE-WINDS*. The origin of the fitness of the sea is sufficiently accounted for when we consider, that the chloride of sodium and other soluble salts which form constituent ingredients of the globe, are being constantly shed out of the soil and rocks by rain and winds, and carried down by the rivers; and as evaporation which feeds the rivers carries none of the dissolved matter back to the land, the tendency is to accumulate in the sea. The principal ingredients found in sea-water are chloride of sodium, or common salt, together with salts of magnesia and lime. A more exact analysis will be given under *WATER*. The average specific gravity of the sea, out of reach of the exceptional action of the melting of snow, rain, or river-water is (at 62° F.) 1.02655. The slight variations in the saltness of the sea must necessarily produce corresponding changes in its specific gravity; accordingly, on the northern and southern limits of the torrid zone, the mean specific gravity of sea water is, in different longitudes, 1.02785, 1.02683; at the equatorial calm belt, it is 1.0252, 57; and on the whole shews a tendency to diminish as the latitude increases, Beechey having found it to be 1.0253 in lats. 55°—60° N. and S. in the Pacific, and King 1.0255 in the corresponding tides of the Atlantic. It is considerably diminished near the mouths of rivers, and in those inlets and semi-lacustrine arms which are the depositories of river-water than compensates for their evaporation, as in the Black Sea, where it is 1.0143, and in the Baltic, only 1.0086.

The temperature of the sea, where it is not affected by currents from a warmer or colder region, necessarily corresponds to the normal temperature of the latitude; but this is true only of the water at the surface, for it has been recently proved that the observations made on deep-sea temperature by Carpenter, Wyville Thomson, and others, that temperature rapidly diminishes with the depth, particularly in tropical and temperate regions, till great depths ice-cold water is everywhere found. As from the extensive observations made by U.S. *Challenger* in the North Atlantic during 1873, it is shewn that at the equator, where the surface temperature is about 80°, the decrease with depth is so rapid, that at 60 fathoms from the surface the temperature is only 61°·5; at 150 fathoms 50°; at 700 fathoms, the temperature has fallen 40°; at about 1600 fathoms, to 36°. Below this it diminishes at a much slower rate, till it falls nearly to freezing at all great depths which are not affected by under-currents with the Antarctic or Arctic Seas. The sea-water of the upper 60 or 80 fathoms is affected by the solar heat. Immediately beneath this sun-heated upper stratum, it is remarkable that all the water in the North Atlantic, as far as lat. 40°, is warmer than that at the same depth near the equator. The mean temperature of the upper 1500 fathoms in the North Atlantic is 4°·5 warmer than the same upper stratum at the equator. As regards the temperature of the water at the bottom, at all stations between Bermuda and the equator on the east side of the Atlantic, the temperature is remarkably uniform at 35°·2; in the

Bay of Biscay, to north-east of this line, it is 1° warmer; south-west of the same line, 1° colder; whereas, further south at the equator, on the western side of the Atlantic, it is 32°·4, or 2°·8 colder. This last fact is of very great importance, since, from the circumstance that at the equator the bottom temperature is 32°·4, and that at all stations to north of it the bottom temperature is warmer, it follows that the cold water at the bottom of the Atlantic, as far north as the Azores and Bay of Biscay, equally with that at the equator, is derived from an Antarctic, and not from an Arctic source. This cold Antarctic current entering the North Atlantic, is found between 1700 fathoms and the bottom, a total thickness of 700 fathoms. Ice-cold water has also been found at the bottom in the Arabian Sea. In land-locked seas, such as the Mediterranean, whose deep water is not in communication with that of the Atlantic, owing to the shallowness of the sea at the Straits of Gibraltar, the bottom temperature does not fall so low as that of the ocean. Thus the temperature of the Mediterranean at 1508 fathoms, is 55°, whereas at this depth in the ocean, it is so low as 36°. See *ISOTHERMAL LINES*. The highest surface-temperature does not correspond with the equator, but owing to the disturbing influence of currents in the following regions: Between Sumatra and the Zanzibar Coast; east of the Philippine Islands, to long. 170° E.; east of Cuba and Florida; and north-east of Cape St Roque.

Colour and Phosphorescence of the Sea.—The colour of the ocean, when free from admixture of foreign substances, as animalcules, vegetable organisms, excessive rain, or the tinted waters of swollen rivers, is a pure deep blue, which becomes less marked where the water is of less depth. A 'different' colour of sea-water is due to the presence of some foreign substance, e. g., the red, brown, and white patches of the Pacific and Indian Oceans, to the presence of swarms of animalcules, and the colours of the Red and Yellow Seas, to matters of vegetable origin. The Rhone, at its emergence from the lake of Geneva, and the lake itself, exhibit an intensity of blue far surpassing that of any sea. The phosphorescence of the sea is due to the presence of myriads of invertebrata, especially rhizopoda, tunicata, &c. See *LUMINOSITY OF ORGANIC BODIES*.

Depth of the Sea.—Till very recently, it might be said that, with the exception of the more frequented strips along the coast, and such other portions as afforded anchorage-ground, our knowledge of the depth of the ocean amounted to nothing. It is true that deep-sea soundings had been frequently made, but from the necessary defectiveness of the ordinary 'lead,' and inattention to the effect of under-currents in destroying the perpendicularity of the line, little dependence could be placed on the results obtained. Even at the present time, our knowledge is confined chiefly to the North Atlantic, the greatest depth of which, as far as it has been ascertained by the accurate soundings of the *Challenger*, is 3875 fathoms, or 23,250 feet (19° 41' N. lat., 65° 7' W. long.), though there are, in all probability, considerably greater depths in the region between the United States, the Bermudas, and Newfoundland. Soundings giving a depth of 2½ and of more than 3 miles were made by Lieutenant Brooke in the Pacific, and this result corresponded very nearly with the estimate of its average depth drawn by Professor Bache from observation of the time taken by the great tide-waves of December 23, 1854, originated by the terrible earthquake which occurred in Japan on that day, to traverse the ocean between Japan and California; the latter giving an average depth of 2365 fathoms, or 2½ miles. From the numerous

islands which stud this ocean, one would be led at first sight to assume its comparative shallowness; but the abruptness with which they rise above the surface, and the remarkable soundings which have been obtained near their shores, completely annihilate this supposition. From the remarkable gentleness of slope of the bed of the Arctic Ocean to the north of Siberia, the line giving only 14—15 fathoms at 150 miles from the shore, and from its configuration on the north of America, it is generally concluded to be by far the shallowest of the oceans, but no one has hitherto ventured to give a deliberate estimate of its depth. Of the depth of the Antarctic Ocean, nothing is *known*, but it is supposed to be deeper than its antipodal kinsman. Till our chart of soundings be tolerably complete, it will be impossible to give any general idea of the conformation of the bed of the sea, but, judging from what has been lately discovered concerning the North Atlantic (q. v.), it would seem as if the land-surface under water were the counterpart as regards eminences and hollows, chasms, valleys, plateaus, &c., of the land-surface above.

Motion of the Sea.—The sea is in a state of perpetual restlessness, its motion being either a vertical oscillation, or an actual transference of its waters from one place to another. The first motion, which constitutes *waves*, is due either to the attraction of the sun and moon on such a mobile body as the sea (see *TIDES*), or to the impulsive action of the winds which blow over its surface (see *WAVES*); the second arises from the sun, which, directly through its heat, and indirectly by scorching dry winds, produces evaporation to a great extent, of the parts most exposed to its influence, and by its similar action on the atmosphere (see *TRADE-WINDS*), causes a transference of this vapour to remote latitudes, where it descends as rain, and, destroying the equilibrium of the sea, gives rise to *currents*. The nature of these currents is described under *GULF STREAM*, and the chief currents of each ocean are found under its own head. This constant motion of the sea is of great service in tending to equalise the temperature of different parts of the globe; it also produces remarkable changes in the form of coasts, eating into rocks, converting low-lying lands into shoals and sand-banks, or carrying away the earthy materials, and depositing them in some distant region. The erosive action of the sea is generally almost imperceptible during several years, but in course of two or three centuries, the magnitude of the changes effected by it is almost incredible.

On the economic value of the sea as a purifier, and as a commercial highway, it is unnecessary to dilate. For some of the peculiar phenomena of the sea, see *ICEBERGS*, *AURORA BOREALIS*, *WHIRLPOOLS*, the five great *OCEANS* (q. v.), *CORAL*, &c.

The term *Sea* is also applied in a more limited though indefinite sense, to an offshoot of one of the oceans, as to the Black, Baltic, Okhotsk Seas, to any portion of an ocean which from its position or configuration is considered deserving of a special name, and to the two great inland salt lakes of Central Asia, the Caspian and Aral Seas.

SEA, SOVEREIGNTY OF THE. Blackstone lays it down that the main or high seas are part of the realm of England, as the Courts of Admiralty have jurisdiction there; but adds that they are not subject to common law. But the law of nations, as now understood, recognises no dominion in any one nation over the high seas, which are the highway of all nations, and governed by the public law of the civilised world. Such a right has, however, long been claimed over the four seas surrounding the British Isles. It was strongly asserted by Selden, and denied by Grotius, and measures were taken to

vindicate the right in the reign of Charles I. England has undoubtedly a right to the exclusive dominion of the sea within a certain not very well-defined distance from the shore, depending on the usage of the country. This right of lordship includes the right to free navigation, to fishing, to taking wrecks, the forbidding passage to enemies, the right of flag, of jurisdiction, &c. By the law of England the main sea begins at low-water mark; i. e. between low and high-water mark the common law and admiralty have a divided jurisdiction, as a land when left dry, the other on the water when it is full sea. By the law of Scotland, the sea is not considered to extend beyond the point which the sea reaches in ordinary tides. See *BLACKBURN*.

SEA CUCUMBER. See *HOLOTHURIA*.

SEA GRAPE (*Ephedra*), a genus of plants of the natural order *Gnetaceae*, a natural order consisting of a small number of species, closely allied in botanical characters to the *Coniferae*, and by many botanists united with that order, although differing in appearance. The *Gnetaceae* are small trees or woody shrubs, with opposite or clustered branches and jointed stems, whence they are sometimes called *JOINT-FIRS*. They secrete not resinous but watery matter. The development of the ovule is peculiar; it has a projecting process forming the intimate covering of the nucleus.

SEA-HAM HARBOUR, a seaport in the county of Durham, 6 miles south of Sunderland. An excellent harbour is furnished with wharves and jetties, and the town contains bottle-blast furnaces, an iron-foundry, and chemical works. It communicates by railway with collieries in the vicinity, and the principal articles of export are coals and agricultural produce. The population of this thriving little seaport town was, in 1871, 7132. The population in 1851 being 3538, it has accordingly more than doubled meantime.

SEA-HORSE, in Heraldry, a fabulous animal, consisting of the upper part of a horse with webbed feet, united to the tail of a fish. A scalloped fin is carried down the back. The arms of the town of Cambridge are supported by two sea-horses, proper finned and maned or.

Sea-horse.

SEA-KALE (*Crambe maritima*; see *CRAMBE*), a perennial plant with large roundish serrated green leaves, found on the sea-shores in various parts of Europe, and in Britain. The blanched leaves have become a very favourite esculent in some parts, although as yet little known on the continent. It is common people, on some of the shores of England, had long been in the practice of washing the roots when they came through the sand, and eating them as a pot-herb, but the cultivation of the plant in the kitchen garden became general only at a comparatively recent date. It requires a deep soil, and the care of the gardener is bestowed on blanching, without which the sprouts are bitter and agreeable, but even acrid. The blanching is accomplished in various ways, by earth, sand, earthenware pots, &c. Sea-kale is generally raised from seed, although also sometimes propagated by cuttings of the roots. The plant does not yield a crop till the third year; but a succession of sea-kale remains productive for many years.

SEAL.

It is planted in rows, four to six feet apart. It ends its tap-root very deep into the ground.

SEAL (Lat. *sigillum*, Fr. *seau*), an impression on wax or other soft substance made from a die or matrix of metal, a gem, or some other material. The stamp which yields the impression is sometimes itself called the seal. In Egypt, seals were in use at an early period, the matrix generally forming that of a ring (see **GEM**, **RING**). Devices of a variety of sorts were in use at Rome, both by the earlier emperors and private individuals. The emperors, after the time of Constantine, introduced *bullae* or leaden seals, and their use was continued after the fall of the Western Empire by the popes, who attached them to documents by cords or bands. On the earlier papal seals were monograms of the pope; afterwards the great seal contained the name of the pope in full, and

a cross between the heads of St Peter and St Paul, while the papal privy seal, impressed not on lead but on wax, known as the *Seal of the Fisherman*, represented St Peter fishing. In the 9th and 10th centuries we find Charlemagne, the Byzantine emperors, and the Venetian doges, occasionally sealing with gold, and we have an instance as late as the 16th c. of a gold seal appended to the treaty of the Field of the Cloth of Gold, between Henry VIII. and Francis I.

Seals were not much used in England in Anglo-Saxon times, but they came into general use after the Norman Conquest. On the royal great seals was the king in armour on a caparisoned horse galloping, his arms being shewn on his shield after the period when arms came into use; and the reverse represented the king seated on a throne. The great seals of Scotland begin with Duncan II.

Great Seal of William the Conqueror.

at the end of the 11th c., and have also for subject the king on horseback; the counterseal, with the seated figure, being used first by Alexander I., and the earliest appearance of the arms of Scotland being in the seal of Alexander II. In both countries there were also the privy seals with the royal arms only.

Ecclesiastical seals first appear in the 9th c., and attained great beauty in the 13th and 14th. They were of the pointed oval form known as *Vesica piscis*; and have for subjects, a figure of the bishop, sometimes of the Trinity, the Virgin, or a patron saint, seated under an elaborate architectural canopy. The arms of the bishop are often added.

Under the Norman monarchs of England, sealing became a legal formality, necessary to the authentication of a deed; and from the 13th c. onwards, the seals of all persons of noble or gentle birth represented their armorial ensigns. The seal was generally appended to the document by passing a strip of parchment or a cord through a slit in the lower edge; and the ends being held together, the wax was pressed or moulded round them a short distance from the extremity, and the matrix impressed on it. Occasionally the seal was not pendant, but the wax was spread on the deed. The coloured wax with the impression was sometimes imbedded in a mass of white wax forming a protective border to it. In England, a seal is still an essential to all legal instruments by which real estate is conveyed; but since subscription has also become necessary, the

practice of sealing has degenerated into a mere formality. The custom was gradually introduced of covering the wax with white paper, on which the impression was made, and latterly wafers have been considered a sufficient substitute for seals.

In Scotland, every freeholder was obliged by statutes of Robert III. and James I. to have his seal of arms, an impression of which was kept in the office of the clerk of court of the shire; and among the Scottish armorial seals of the 14th and 15th centuries are some of wonderful beauty of execution. Act 1540, c. 117, for the first time made subscription an essential formality to deeds; but sealing still continued to be necessary till 1584, when it was dispensed with in the case of deeds containing a clause of registration, and soon afterwards the practice was altogether laid aside.

The use of corporate seals by towns and boroughs dates as far back as the 12th century. The earlier corporate seals bear the town gates, city walls, or some similar device; the use of corporate arms did not begin till the latter half of the 14th century.

The principal use of seals in the present day is in closing letters, and even for this purpose they have of late years been less used than formerly, owing to the fashion of using stamped adhesive envelopes.

The study of mediæval seals is of great importance and interest in connection with many branches of archaeology, including heraldic and genealogical investigations. See **GREAT SEAL**; **PRIVY SEAL**.

SEAL.

SEAL (*Phoca*) a Linnæan genus of Mammalia, now forming the family *Phocidae*, and including all that family except the *Morse* (q. v.), or *Walrus*. The name *S.* is from the Anglo-Saxon *Seol*. The *Phocidae* constitute, in Cuvier's system, a section of *Carnivora* (q. v.) designated *Amphibia*. Their

Skeleton of Seal, with outline of the figure.

structure is most perfectly adapted to an aquatic life, and they live chiefly in water, but spend part of their time on shore, reposing and basking in the sunshine on rocks, sand-banks, icefields, or beaches; and they bring forth their young on shore. The body is elongated, and tapers from the chest to the tail; the head somewhat resembles that of a dog, and in most of the species the brain is large; the feet are short, and little more than the paw projects beyond the skin of the body; all the feet are thoroughly webbed, and five-toed; the fore-feet are placed like those of other quadrupeds; but the hind-feet are directed backwards, like a prolongation of the body, and between them is a short tail. The toes, particularly those of the hind-feet, are capable of being spread out very widely in swimming, so as to give great propulsive power. The movements of seals in the water are very rapid and graceful; on land, they are very peculiar; even the fore-feet being little used or not at all, but the body contracted by an upward bending of the spine, and so thrown forward by a succession of jerks; in which way, however, a *S.* makes its escape very rapidly from an assailant. The flexibility of the spine in seals is very remarkable, and depends on the very large intervertebral cartilages, formed of fibrous concentric rings. The muscles, which are connected with the spine on all sides, are of great strength.

The teeth differ considerably in the different genera, but in all are adapted for the seizure of slippery prey, the chief food of seals being fishes, although they do not reject other animal food, and are said even to feed in part on vegetable substances. Their incisors are either six in the upper jaw and four in the lower, or four in the upper and two in the lower; they all have large and strong canine teeth; and the molars, usually five or six on each side in each jaw, are either sharp-edged or conical, and beset with points. Seals have a remarkable habit of swallowing large stones, for which no probable reason has yet been conjectured. Their stomachs are very often found to be in part filled with stones. The stomach is quite simple; the gullet (*œsophagus*) enters it at the left extremity; the cœcum is short, the intestinal canal long.

The respiration of seals is extremely slow, about two minutes intervening between one breath and another, when the animal is on land and in full activity. A *S.* has been known to remain twenty-five minutes under water. Their slowness of respiration, and power of suspending it for a considerable time, is of great use, as enabling them to pursue their prey under water. The fur of seals is very smooth, and abundantly lubricated with an oily secretion. There is generally an inner coating of rich fur, through which grow long hairs, forming

an outer covering. Another adaptation to aquatic life and cold climates appears in a layer of fat immediately under the skin—from which Seal Oil is obtained—serving not only for support when food is scarce, but for protection from cold, and at the same time rendering the whole body lighter. The nostrils are capable of being readily and completely closed, and are so whilst the *S.* is under water; as there is a similar provision for the ears; whilst the eye, which is large, exhibits remarkable peculiarities, supposed to be intended for its adaptation to use both in air and water. The face is provided with strong whiskers, connected at their base with large nerves.

Seals produce their young only once a year, sometimes one, sometimes two, at a birth. Not long after their birth, the young are conducted to the mother into the sea. Many, if not all, of the species are polygamous. Terrible fights are among the males.

Seals are very much on their guard against the approach of man, where they have been not molested; but where they have been subjected to no molestation, they are far from being shy, and approach very close to boats, or to men on shore, if animated by curiosity. They are much affected by musical sounds. A flute is said to attract them to a boat, where they have not learned caution from sore experience; and the ringing of the church bell at Hoy, in Orkney, has very often caused the appearance of numerous seals in the little bay. Seals possess all the five senses in great perfection.

The Common *S.* and some of the other species are very intelligent; but there is considerable difference in this respect among the species. The Common and some others have often been tamed, and are capable of living long in domestication, if well supplied with water. They become very familiar with those who attend to them, are very kind, caresses and of notice, recognise their names like dogs, and readily learn many little tricks, of which advantage has been taken for exhibitions.

Seals are found in all the colder parts of the world, most abundantly in the arctic and antarctic regions; some of them also in temperate climates as far south as the Mediterranean, and as far north as the La Plata. Some of them ascend rivers to a distance in pursuit of salmon and other fish. They are found in the Caspian Sea, and even in the fresh water Lake Baikal.

The species are numerous, but in no group of Mammalia does more remain for further investigation. Seals are divided into two principal groups—*Seals*, more strictly so called, and *Otaries* (q. v.), the former distinguished by the complete want of external ears, which the latter possess, and by their dentition. The true seals have been further divided into genera, chiefly characterised by their dentition. In the restricted genus *Phoca*, or *cephalus*, the incisors are pointed and sharp—six above and four below. The Common *S.* (*P. vitulina*) is found in the northern parts of the Atlantic Ocean, and in the Arctic Ocean. It is common on the wilder and more unfrequented parts of the British coast, particularly in the north. It is remarkably distinguished, even among its nearest congeners, by the oblique position of the canine teeth. The fur is yellowish, variously spotted, and marked with brown. The whole length is from 10 to 5 feet. Its love of salmon is so great that it has been known to haunt the neighbourhood of a salmon-net for a long time, and to take the bait after they were entrapped in it. The Common *S.* is generally seen in small herds. Its skin and blubber of considerable mercantile importance. The skin is dressed with the fur on, to make caps, &c. &c.

SEALING-WAX—SEAL OF CONFESSION.

tanned and used as leather. The oil, when made before decay has begun, is colourless and nearly inodorous; it is much superior to whale-oil. The flesh is much used for food in very northern countries, as is that of all the other species which they produce. It is not easy to shoot a seal. Whilst flint-locks were in use, the S. always dived so quickly on seeing the flash as generally to escape the ball. The popular name *SEA-CALF*, and the specific name *vitulina*, have reference to a supposed resemblance of the voice to that of a calf.—The *HARP S.* (*P. Grœnlandica*) receives its popular

Harp Seal (*Phoca Grœnlandica*), attitude on land.

name from a large, black, crescent-shaped mark on each side of the back. It is sometimes seen on the British coasts, but belongs chiefly to more northern regions. It is from 6 to 8 or even 9 feet in length. The *GREAT S.*, or *BEARDED S.* (*P. barbata*), also found on the British coasts, and plentiful on the coasts of Greenland, is generally about 9 or 10 feet long, sometimes more.—The *ROUGH* or *BRISTLED S.* (*P. hispida*) frequents quiet bays on the coasts of Greenland, where many thousands are annually killed for their skins and oil. It is the smallest of the northern species.—The *GRAY S.* (*Halichœrus rufus*), which has a very flat head, and attains a

Common Seal (*P. vitulina*), attitude when swimming.

ze nearly equal to the Great S., occurs on the British coasts, but is much more common in more northern latitudes, and in the Baltic Sea.—The *CRESTED S.* (*Stenmatopus cristatus*) is remarkable for the elevation of the septum of the nose of the adult male into a crest, which supports a hood covering the head, and capable of being distended and elevated or depressed at pleasure. The use of this appendage is not known. This S. is plentiful on the coasts of Greenland and the northern parts of North America.—The seals of the southern seas are quite distinct from those of the northern. One of them is the *SEA LEOPARD*, or *LEOPARD S.*

(*Leptonyx Weddellii*), so called from its spotted fur. It is found on the South Orkneys and other very southern islands. By far the largest of all the seals is the *ELKPHANT S.*, or *Sea Elephant* of the southern seas.

Seals are to some extent migratory, although their migrations do not extend to very great distances, and are probably regulated by the abundance or scarcity of food. The time of the return of certain species to certain coasts, is very confidently reckoned upon by the natives of the north and by seal-hunters.

Seal-hunting—or *fishing*, as it is often called—requires great patience and skill. Most of the seals, if not all, are gregarious, and one seems to be always placed on the watch, where danger is to be apprehended from bears or from hunters. They climb up through holes in the ice-fields of the polar seas, even when there is a height of several feet from the water, but it is difficult for the hunter to get between them and the hole. Nor is seal-hunting unattended with danger, an enraged S. being a formidable antagonist, at least to the inexperienced.

Seal-hunting is the great occupation of the Greenlanders, but it is also extensively prosecuted in other northern parts of the world; great numbers are taken on the coasts of Newfoundland and other northern parts of America; whale-fishers kill seals as they find opportunity; and vessels are fitted out expressly for the purpose, from the northern parts of Europe and of America.

SEALING-WAX. A composition of hard resinous materials used for receiving and retaining the impressions of seals. Simple as it may appear, its manufacture is one of great importance, and formerly was far more so than at present—the use of gummed envelopes having to a great extent superseded it. Common beeswax was first used in this country and in Europe generally, being mixed with earthy materials to give it consistency. Nevertheless, it was difficult to preserve it, as a very small amount of heat softened it.

The Venetians, however, brought the Indian sealing-wax to Europe, and the Spaniards received it from the Venetians, and made it a very important branch of their commerce. The great value of the Indian wax consisted in the fact that it was made only of shell-lac, coloured with vermilion or some other pigment, and this has been found superior to all other materials. In addition to the shell-lac and colouring material, there is always added to the wax made in Europe a portion of Venetian turpentine (see *TURPENTINE*), and of resin.

SEA-LION. See *OTARY*.

SEA-LION, in Heraldry, a monster consisting of the upper part of a lion combined with the tail of a fish.

SEAL ISLANDS, or *LOBOS ISLANDS*. See *PERU*.

SEALKOTE, a town in the Punjab, near the left bank of the Chenab, 65 miles north-north-east from Lahore. It contains (1872) 25,337 inhabitants, and carries on the manufacture of paper. S. was formerly a military station, and at the period of the outbreak of the Indian mutiny, there was a rifle-practice dépôt here. All the European troops had been removed in July 1857 to repress disturbances that had broken out elsewhere, and on the 9th of that month the native troops fired on their officers. A considerable number of Europeans were killed, and the survivors suffered great privations until the sepoys, having plundered the station, started off in the direction of Delhi.

SEAL OF CONFESSION. See *CONFESSION* and *CONFIDENTIALITY*.

SEAMEN are technically those persons below the rank of officer, who are employed in navigating decked vessels on the high seas—men working on lakes and rivers being usually styled 'watermen.' Two opposite conditions are essential to the well-being of the vessel—first, the absolute subordination and perfect obedience of the crew to the master; and secondly, their protection against tyranny or caprice on his part. For this purpose the law of England is extremely minute in the rules laid down for both masters and seamen.

By an act of 1845, specially levelled against pimps and swindling agents, no person may hire seamen except the owner or master of a ship, and individuals licensed for that purpose by the Board of Trade. Under the Mercantile Marine Act of 1850, a written agreement must be made when a man is engaged, setting forth the nature and length of voyage, the capacity in which the man is to be employed, wages, fines, provisions, punishments, &c. If the ship be going abroad, this agreement must be attested before a shipping-master, who has a power of periodical inspection over the agreements of all seamen in vessels in his port. Any clause in the agreement would be inoperative which deprives the sailor of a lien upon his ship, or of other recovery for his wages, or of rights of salvage. In virtue of this agreement the seaman is bound to do his utmost in the service of the vessel; and consequently, if a master of a ship in distress promise his men extra pay for extraordinary exertions, the men cannot compel him to fulfil his promise.

In the event of disobedience or insubordination the master may administer correction, the law holding him responsible that such correction is reasonable. Desertion from the ship is punishable by imprisonment; and deserters may be apprehended on the information of the master without warrant. In case of open mutiny, the master may adopt the most stringent measures.

The mariners' wages are contingent on the success of the voyage; consequently, if the ship be lost or taken, the seamen lose their claim on the owners. It is a misdemeanour for the master to leave a sailor on shore in foreign parts, unless through the man's wrongful act.

SEA MOUSE (*Aphrodite*), a genus of dorsibranchiate annelida, of the family *Aphroditidae*, to all of

Sea Mouse (*Aphrodite aculeata*).

which the popular name is extended. They are readily distinguished by two longitudinal ranges of broad membranous scales covering the back, under which are the gills in the form of little fleshy crests. The scales move up and down as the animal respire; and are concealed by a substance resembling tow or felt, which permits the access of water but excludes mud and sand. The head is furnished with tentacles; some have two eyes and some four. The body is edged with spines. Besides all this, its sides are covered with flexible bristles or silky hairs, which give to these creatures a wonderful beauty of colour, unsurpassed by that of humming-birds or the most brilliant gems. Each hair, even

when viewed singly, and moved about in the sunshine, reflects all the hues of the rainbow. The sea-mice are generally to be found concealed under stones, and dwell amongst the mud at the bottom of the sea. Storms frequently throw them on to the beach in great numbers. A very beautiful species, *A. aculeata*, of an oval form, about 6 or 8 inches long, and 2 or 3 broad, is the Common S. M. of the British coasts.

SEA PIKE (*Centropomus undecimalis*), a fish which, notwithstanding its popular name, belongs to the perch family. Its form, however, is elongated like that of the pike. The body is compressed; there are two dorsal fins; the mouth is not very large; and the teeth are numerous, small, and equal. The colour is silvery-white, tinged with green on the back. It is found on the western coasts of tropical America. It attains a large size and is a valuable fish. On the British coasts, the name S. P. is sometimes given to the Garfish.

SEA PINK. See THRIFT.

SEARCH OF ENCUMBRANCES means an inquiry made by a purchaser or mortgagee of land as to the burdens and state of the title, in order to see whether his purchase or investment is safe. Owing to the want of any general system of registration of deeds affecting land in England, it is not possible by any search to find out with certainty all these burdens; nevertheless, there are several special registers which are usually included in the searches, such as judgment debts, bankruptcies disentailing deeds, annuity deeds, &c. The search usually goes back for 60 years. In Scotland, where all the deeds affecting land rights are registered, it is easy to discover the exact state of the title and burdens on the land. The usual search is not only for 40 years. The registers are subdivided into various kinds—as the general and particular Register of Sasines, the Record of Abbreviations, Adjudications, Register of Inhibitions, &c. See RECORDS.

SEARCH-WARRANT is an authority granted to a constable by a justice of the peace to enter the premises of a person suspected of secreting stolen goods, in order to discover, and if found to seize the goods; and similar warrants are granted to discover property in respect of which other offences are committed. Before such a warrant can be issued, credible witness must on oath prove a reasonable cause to suspect that the party proceeded against has the property in his possession or on his premises. The name of the person whose premises are to be searched must be correctly described in the warrant.

SEA-SERPENT. There are in the tropical and sub-tropical seas from the southern coasts of Africa to the South Sea Islands, numerous sea-serpents which in so far as they are yet known, are all venomous, and belong to the family *Hydroids*. None of them, however, is known to exceed 100 feet or thereby in length, so that their existence cannot account for the stories which from time to time have been published of the appearance of the Great Sea-serpent, which, moreover, generally inhabits the Atlantic Ocean, where none of the *Hydroids* have yet been found. It is still doubtful whether or not the Great Sea-serpent ought to be reckoned among creatures merely fabulous or imaginary. Pontoppidan speaks of it in his *Natural History of Norway*, assigning to it a length of 600 feet. He describes it, not from personal observation but from the testimony of others, as lying in the water in many folds, and appearing like many heads floating in a line, at a considerable distance from each other. Such a creature is said to be

SEA-SERPENT.

appeared more recently on the coast of Norway, in 1819, and to have been seen daily for a whole month, seeming to dse in the sunbeams; and again there is a story of its appearing in 1822, and another of its appearing in 1837, when it greatly alarmed some fishermen who thought that it followed their boat. Hans Egede mentions its appearance on the coast of Greenland in 1734. Mr M'Clean, the minister of a parish in the Hebrides, saw a sea monster in 1809, which, however, he supposed to be only 70 or 80 feet long, of serpent-like form; which was also seen, about the same time, by the crews of a number of fishing-boats, and caused them great alarm. In his description of this animal, he distinctly states that it seemed to move by 'undulation up and down,' which is not only contrary to all that is known of serpents, but from the structure of their vertebrae, impossible. (See SERPENTS.) Several instances have occurred of the supposed appearance of the Great Sea-serpent on the Atlantic coasts of North America. In June 1815, and in August 1817, it is said to have been frequently seen, in calm bright weather, near Gloucester, about 30 miles from Boston, on the surface of the water, like a number of buoys in a line, and sometimes moving very rapidly. Testimonies vary as to the length, from 80 feet to 250 yards. We hear again of the Sea-serpent as seen off Nahant, near Boston, in August 1819, in calm and serene weather, making curves 'perpendicular to the surface of the water,' and its eye 'brilliant and glistening.' A similar account is given of its appearance off Nahant in July 1833. In Silliman's *Journal of Science* for 1835 there is a notice of such an animal seen by the captain and crew of an American brig, on her passage from Boston to New Orleans, and also of a similar occurrence in lat. $34\frac{1}{2}^{\circ}$, and long. 48° W. Great interest was excited in 1848 by an account of a Great Sea-serpent seen in lat. $24^{\circ} 44'$ S, and long. $9^{\circ} 20'$ E, and therefore in the South Atlantic Ocean, near the Tropic of Capricorn, and not very far from

Sea-serpent.
(From Pontoppidan.)

the coast of Africa, by the officers and crew of her Majesty's frigate *Dadalus*. It was not, as in other cases, in bright and fine weather, but in dark and cloudy weather, and with a long ocean swell. The animal was swimming rapidly, and with its head and neck above water. Captain M'Quhae, in his Report to the Admiralty, describes it with confidence as 'an enormous serpent, with head and shoulders kept about 4 feet constantly above the surface of the sea;' and he adds: 'as nearly as we could approximate by comparing it with the length of what our maintopsail-yard would shew in the water, there was at the very least 60 feet of the animal *d fleur d'eau*, no portion of which was, to our perception, used in propelling it through the water, either by vertical or horizontal undulation. It passed rapidly, but so close under our lee-quarter, that had it been a man of my acquaintance, I should

have easily recognised his features with the naked eye; and it did not, either in approaching the ship or after it had passed our wake, deviate in the slightest degree from its course to the south-west, which it held on at the pace of from 12 to 15 miles per hour, apparently on some determined purpose. The diameter of the serpent was about 15 or 16 inches behind the head, which was, without any doubt, that of a snake; and it was never, during the twenty minutes that it continued in sight of our glasses, once below the surface of the water; its colour a dark-brown, with yellowish-white about the throat. It had no fins, but something like the mane of a horse, or rather a bunch of sea-weed, washed about its back.' Regret has been very naturally expressed that Captain M'Quhae did not bestow a shot on it. Figures prepared from a sketch by him were published in the *Illustrated London News* of 28th October 1848. About the same time, the testimony of another witness, Lieutenant Drummond, appeared, and was found to differ in some important points from the account of the animal given by Captain M'Quhae, and the figures published with his approbation, particularly in ascribing a more elongated form to the head, in the mention of a back-fin, whereas Captain M'Quhae expressly says that no fins were seen; and in a lower estimate of the length of the portion of the animal visible. Lieutenant Drummond's words are: 'The appearance of its head, which, with the back fin, was the only portion of the animal visible, was long, pointed, and flattened at the top, perhaps 10 feet in length; the upper jaw projecting considerably; the fin was, perhaps, 20 feet in the rear of the head, and visible occasionally; the captain also asserted that he saw the tail, or another fin about the same distance behind it; the upper part of the head and shoulders appeared of a dark-brown colour, and beneath the under jaw a brownish-white. It pursued a steady and undeviating course, keeping its head horizontal with the water, and in rather a raised position, disappearing occasionally beneath a wave for a very brief interval, and not apparently for the purposes of respiration. It was going at the rate of perhaps from 12 to 14 miles an hour, and when nearest was perhaps 100 yards distant. In fact, it gave one quite the idea of a large snake or eel.' Lieutenant Drummond's account is the more worthy of regard, as it is derived from his log-book, and so gives the exact impressions of the hour, whilst Captain M'Quhae's was written from memory after his arrival in England. Into the discussion which arose concerning this case, it is out of our power to enter.

There is no reason to doubt the truthfulness of the statements made in any of these cases, although, in most of them, there is room for doubt as to the accuracy of observation. It has been suggested, and not without much appearance of probability, that the supposed sea-serpent might in some instances be a mere line of porpoises or such cetaceans, which often follow one another in lines. It has been thought that a line of floating sea-weed might account for the appearances presented. It has also been suggested that the creature seen from the *Dadalus*, might be a sea-elephant or other large seal, swimming for its life, far from land. And Dr Owen has expressed much doubt as to the existence of a Great Sea-serpent on the ground that no bones or other remains of any such recent animal have occurred; and this negative evidence he regards as more than enough to counterbalance all the positive evidence yet adduced in favour of its existence. It is, however, to be remembered, that there are many fishes which inhabit the depths of the ocean, and seldom visit the shallower waters near the shores,

some of which are scarcely known except by single specimens; and the same thing is true as to Cetacea; so that it is very far from improbable that many species belonging to the ocean depths are still unknown to us. As to the Great Sea-serpent, if we should admit the general accuracy of the accounts given of it by those who supposed themselves to have seen it, there is no reason for concluding it to be a reptile; it might at least as easily be supposed to be a fish of elongated form, and, indeed, much more probably, as a reptile would need to come to the surface to breathe, which a fish would not. The first volume of the *Wernerian Society's Transactions* contains an account of an animal, 56 feet long, which was cast ashore on the island of Stronsa, one of the Orkneys, in 1808, and of which some of the vertebrae are preserved in the Museum of the University of Edinburgh, but which, unfortunately, did not come under the observation of any competent naturalist in its perfect state. On the high authority of Dr Owen, it is pronounced to have been a basking shark; but other men of science have expressed a different opinion.

SEA-SHORE, or land bordering on the sea, belongs partly to the crown, and the public have certain rights in relation thereto. The soil or property in the sea-shore is vested in the crown, and the limit on the land side is defined to be the medium line of high-water of all the tides in the course of the year, or the height of the medium tides in each quarter of a lunar revolution during the whole year. But though the crown is *prima facie* the owner of the sea-shore, the owner of the adjoining manor has sometimes a grant of it, and he proves this grant by ancient use—such as gathering sea-weed, &c. The public have a right to walk on that part of the shore vested in the crown, which holds it as a trustee for them. But the public have no right to trespass on the adjacent lands in order to get at the shore, so that it is only where a highway leads to the shore, or the public land from seaward, that the right can be made available. Thus it has been decided that the public have no legal right to trespass on the adjoining lands in order to get to the shore for purpose of bathing. The public have a right to fish on the sea-shore if they get legal access to it, and may take all floating fish, but not oysters or mussels which adhere to the rock, if the soil belongs to an individual. The public have no right to gather sea-weed or shells, though, as regards the latter, it is of so little consequence that nobody prevents them. Nor have fishermen a right to go on that part of the sea-shore which is private property to dig sand for ballast, or to dry their nets, or similar purposes, though in a few cases local customs permitting this have been held valid. In Scotland, the right to the sea-shore is also vested in the crown, but when a crown grant gives land bounded by the sea-shore, this is held to give to the grantee the fore-shore also.

SEA-SICKNESS is a variety of vomiting deserving of special notice. It is often preceded by premonitory symptoms, which appear almost immediately after a susceptible person is exposed to the motion of rolling water in a vessel or boat, and are as distressing as the vomiting itself. Amongst these symptoms may be mentioned vertigo and headache, with a peculiar feeling of sinking and distress about the pit of the stomach. Vomiting, however, in general, soon comes on, accompanied with convulsive heaving of the stomach, and such an indescribable feeling of prostration as to render the patient utterly regardless of what is going on around him, and almost indifferent to life. Moreover, a deadly pallor, a profuse cold sweat, and diarrhoea, are more or less

commonly present. The susceptibility to this troublesome affection varies extremely in different persons. Some never suffer from it, others only on their first voyage, and others, again, in every voyage they undertake; with some it continues but a few hours, while others suffer almost continuously throughout a long voyage. In the great majority of cases, the sickness disappears in a few days, and the weather be very boisterous. It almost always ceases on landing, although more or less giddiness may prevail for some hours, the patient when walking feeling as if the earth were rising up under his feet. Infants and aged persons are supposed to possess a comparative immunity from sea-sickness, while, as a general rule, women suffer more than men. According to Dr Althaus, persons with a strong heart and a slow pulse generally suffer less from sea-sickness; while irritable people, with a quick pulse and a tendency to palpitation, are more liable to be affected; and he thus accounts for the different liability of different nations to this affliction; 'for, as a rule, the French and Italians, being of a more irritable temper, suffer most from this disorder, the Germans less, and the English least.' ('On Sea-sickness as a form of Hyperaesthesia,' *Proceedings of the Medico-Chirurgical Society*, vol. v. p. 23.)

The primary cause (or rather condition) of sea-sickness is the motion of the ship; and the position of a vessel, or alternate rising and falling of the bow and stern, is especially apt to produce it. It is less felt in large and heavily ballasted vessels, because the movements referred to are less perceptible in them. How this cause operates on the subject regarding which there has been much discussion; and without entering into the history of the views of different physicians on this subject, we may state that the most recent is that of Dr Chapman, who holds that the motions of the vessel cause the accumulation of an undue amount of blood in the nervous centres along the back, and especially in those segments of the spinal cord related to the stomach, and the muscles concerned in vomiting. This condition is induced, as he maintains, in two different ways, viz., (1.) by the movements of the brain, which are much greater in a pitching vessel than on land; and (2.) by the corresponding movements of the spinal cord; and (3.) by the excessive movements of the viscera within the abdominal and pelvic cavities. In one person the brain may be mainly responsible in causing that preternatural afflux of blood in the spinal cord, on which according to Dr Chapman's hypothesis sea-sickness depends; in another, the spinal cord may be the main agent; and in a third, the abdominal viscera, although each is always concurrent in some degree. Hence, the only scientific and really effective remedy for this disorder, must be one which has the power of lessening the amount of blood in the vessels of the nervous centres along the back, and this may be done by lowering the temperature of the spinal region by the local application of ice. For a description of Dr Chapman's 'spinal ice-bag' may be obtained from any respectable surgical instrument-maker, and for the method of applying them, we must refer to his work *On Sea-sickness, its Nature and Treatment*, p. 37 (Lond. 1864). He gives the details of 17 cases in which the remedy was of greater or less benefit; in most of the cases the result was perfectly successful. Besides Dr Chapman's evidence we have that of Captain W. J. commander of one of the Newhaven and Dover boats, who states that 'in ordinary weather it is Chapman's remedy is a success. I had some difficulty in persuading passengers to try it, but those who did were benefited.' Mr Bradley, surgeon at the

Cunard Service, in a letter to *The Lancet*, December 3, 1864, writes as follows: 'I have tried this remedy in severe cases when other remedies have failed (chloroform, iced champagne, effervescing draughts, fresh air, &c.), and have very generally found it do great good. In no case does it do harm, but in the great majority of instances it soothes the nervous irritability which so commonly accompanies severe sea-sickness, induces sleep, and consequently relieves exhaustion.' We are permitted to publish the following extract of a letter from Dr Hayle of Rochdale, to Dr Chapman, dated June 3, 1865: 'I recommended a patient about to cross the Atlantic, to try one of your ice-bags for sea-sickness. The result was most satisfactory. He was never sick when wearing the bag. Once he went without it, and then, and then only, was he sick. His friend, who had no ice-bag, was frequently sick.' As an ancillary remedy, the drinking of iced water, or the swallowing of small lumps of ice, may be recommended. Dr Chapman prefers the ice, which, 'brought in contact with the peripheral ends of the nerves of the stomach, will act on the same principle as it does when applied to the spinal region.'

Those who are susceptible to this distressing affection, and have not the opportunity of trying the ice-bags, may, at all events, diminish the severity of the vomiting by assuming, and as long as possible retaining, the horizontal position, as nearly as possible in the centre of the ship's movement, and keeping the eyes closed. The compression of the abdomen, by means of a broad tight belt, sometimes gives relief. A few drops of chloroform on a lump of white sugar will sometimes check the tendency to vomiting in persons who only suffer slightly. A little arrowroot, flavoured with brandy or sherry, is usually a kind of food that will most easily remain on the stomach, when the severity of the symptoms is abating. Dr Wood, one of the most eminent of the American physicians of the present day, asserts that he has 'found nothing under such circumstances so acceptable to the stomach as raw salt oysters.'

SEASIDE GRAPE (*Coccoloba uvifera*), a small tree, of the natural order *Polygoneæ*, a native of the West Indies. It grows on the sea-coasts; has orbicular, cordate, leathery, shining, entire leaves, and a pleasant, subacid, eatable fruit, somewhat resembling a currant, formed of the pulpy calyx investing a bony nut. The extract of the wood is extremely astringent, and is sometimes called **JAMAICA KINO**. The wood itself is heavy, hard, durable, and beautifully veined.

SEA SLUG. See **HOLOTHURIA**.

SEASONING, a term in Cookery for the materials used to add flavour to food. They are chiefly salt, the spices, and pot-herbs. Salt is the most important, for it not only increases the sapidity of most kinds of food, but also adds to their wholesomeness.

SEASONS. In the article **EARTH**, the motions of the earth on which the changes of the seasons ultimately depend, are explained. The chief cause of the greater heat of summer and cold of winter is that the rays of the sun fall more obliquely on the earth in the latter season than in the former. See **CLIMATE**. Another concurrent cause is the greater length of the day in summer, and of the night in winter. Within the tropics, the sun's rays have at no time so much obliquity as to make one part of the year very sensibly colder than another. There are therefore either no marked seasons, or they have other causes altogether, and are distinguished as the *Wet* and *Dry* seasons. This is explained in the article **RAIN**. But in all the temperate parts of

the globe, the year is naturally divided into four seasons—*Spring, Summer, Autumn, and Winter*. In the arctic and antarctic regions, spring and autumn are very brief, and the natural division of the year is simply into summer and winter, the winter being long, and the summer short; and this is very much the case also in regions of the temperate zones lying near the arctic and antarctic circles. In subtropical regions, the distinction of four seasons is, in like manner, very imperfectly marked. This distinction is everywhere arbitrary as to the periods of the year included in each season, which really vary according to latitude, and partly according to the other causes which influence climate; the seasons passing one into another more or less gradually, and their commencement and close not being determined by precise astronomical or other phenomena. The greatest heat of summer is never reached till a considerable time after the summer solstice, when the sun's rays are most nearly vertical, and the day is longest; the greatest cold of winter is in like manner after the winter solstice, when the day is shortest, and the sun's rays are most oblique; the reason in the former case being, that as summer advances the earth itself becomes more heated by the continued action of the sun's rays; in the latter, that it retains a portion of the heat which it has imbibed during summer, just as the warmest part of the day is somewhat after midday, and the coldest part of the night is towards morning. The four seasons of temperate regions are distinguished by the phenomena of nature which characterise them, and which are of the greatest importance in relation to the wants and labours of man. But the renewal of vegetative activity in spring is not to be ascribed entirely to the increasing warmth of the sun's rays. Plants are so constituted that a period of rest is followed by new activity, and this new activity very generally begins in the fresh circulation of sap and enlargement of buds whilst the cold of winter still continues unabated, or before it has reached its greatest intensity. A similar remark may be made with regard to some of the phenomena of animal life, which may as well be said to herald the approach of spring as to attend its first days of genial weather.

SEA URCHIN. See **ECHINIDÆ**.

SEAWEED and **SEA WRACK.** See **FUCACEÆ** and **WRACK**.

SEBASTIAN, SAINT, a very celebrated martyr of the early church, whose memory is venerated in both branches of the church, east as well as west (although the scene of his martyrdom was the city of Rome), and whose story has formed one of the most popular themes of Christian artists from the earliest times. His history is contained in the so-called acts of his martyrdom, which, although partaking of the legendary tone, are regarded as authentic, not only by Baronius and the Bollandists, but also by Tillemont and others of the more stringently critical schools of ecclesiastical history. S., according to this narrative, was born at Narbonne and educated at Milan. Although a Christian, he entered the Roman army, without, however, revealing his religion, and with the view of being enabled, by his position, to assist and protect the Christians in the persecution. In this way he supported and comforted many of the martyrs in Rome; and he even converted Nicostratus, the keeper of the prison in which the martyrs were confined, and his wife, Zoe, to whom he miraculously restored the use of her speech, after she had been dumb for six years. Still unrecognised as a Christian, S. rose to high favour under Diocletian, while at the same time the grateful pontiff, Caius, named him

'Defender of the Church.' At length came the time for his open profession of his faith. Diocletian used every effort to induce him to renounce the Christian creed, but in vain; and in the end he was condemned to be put to death by a troop of Mauritanian archers, who transfixed him with numberless arrows, and left him as dead. But a Christian lady, Irene, finding that life was not extinct, had the body removed to her house, where life was restored; and although the Christian community desired to conceal his recovery, S. again appeared in public before the emperor, to profess his faith in Christianity. Diocletian condemned him to be beaten to death with clubs in the amphitheatre; and his body was flung into one of the sewers of the city, in which it was discovered, according to the Acts of Martyrdom, by means of an apparition, and carried by a Christian lady, Lucina, to the catacomb, which is still called by his name. The date of his martyrdom was January 20, 288. By the Greeks the feast is held on the 20th December. The festival was celebrated with great solemnity in Milan as early as the time of St Ambrose; and it was observed in the African Church in the 4th century. There is another saint of the same name, who is said to have suffered martyrdom in Armenia.

SEBASTIANI, FRANÇOIS-HORACE-BASTION, marshal of France, was born November 10, 1772, at Porta d'Ampugnano, a village near Bastia, in Corsica. He was the son of a tailor, but his extreme vanity led him to declare himself of noble descent and a distant relative of the Bonapartes. He entered the army as a sub-lieutenant of infantry, August 27, 1789. His rise, due to his bravery in the field, was no doubt somewhat aided by his splendid physique, graceful manner, and facile diction. He became *chef-d'escadron* in 1797, and brigadier in 1799, and was one of Napoleon's most devoted partisans. He fought at Marengo, executed some important diplomatic service in Turkey in 1802—1803, after which he became general of brigade (August 1803), and was wounded at Austerlitz. On May 2, 1806, he was again deputed to Turkey, this time to break the alliance of the Porte with Russia and England; and before he had been seven months at Constantinople, his mission had obtained complete success, and war was declared. The English fleet forced a passage through the Dardanelles, and cast anchor before Constantinople, their presence causing such terror among the sultan's ministers that a total reversal of foreign policy was imminent, but S., coming to the rescue, revived with his seducing eloquence their failing resolution, and assuming an authoritative superintendence of the preparations for defending the coast, put the batteries in a state fit for action. In five days, he had the coast batteries manned with 600 guns, 100 small gunboats afloat, a line of vessels laid along shore, each with a broadside ready to be discharged on the English fleet, which at last gallantly ran the gantlet, losing two ships and 700 men. But the death of the sultan, and the treaty of Tilsit, put an end to the French intrigues in Turkey, and S. was recalled June 1807, and decorated with the grand cordon of the Legion of Honour. He subsequently commanded the fourth corps-d'armée in Spain. He distinguished himself in the Russian campaign of 1812, and at Leipzig. On the exile of Napoleon to Elba, he gave in his adherence to the Bourbon government, but joined his old master on his return. After the revolution of 1830, he held for brief periods the portfolios of naval (1830) and foreign affairs, and the embassies to Naples (April 1833) and London (January 1835); but was more distinguished for his elegance, and graceful demeanour in the Parisian salons, than as a politician

or administrator. He died at Paris, July 2, 1851.

SEBASTIANI'STAS, the name given in Portugal and Brazil to persons who believe in the future return to earth of the king Dom Sebastian, who fell in the battle of Alcazarquebir, 1578 A.D., while leading on his army against the Moors. The belief has continued to be entertained by many in Portugal; but the S. are said to be now more numerous in Brazil. On the return of Dom Sebastian they expect Brazil to enjoy the most perfect prosperity and happiness.

SEBASTOPOL, or, as it is sometimes written in accordance with modern Greek pronunciation, SEVASTOPOL (*Sebastopolis*, the 'august city'), a Russian seaport, fortress, and arsenal in the Crimea, in the government of Taurida. It is situated on the south-west extremity of the Crimea, on the southern side of the magnificent harbour or roadstead of S., one of the finest natural harbours in the world. This harbour is an inlet of the Black Sea, stretching inland for about four and a half miles from west to east, about half a mile wide at the entrance, but immediately opening out to the width of a mile, with an average width of about half a mile up to the eastern end. It is sheltered on the north and south by lofty limestone ridges, shutting it completely in, with a depth of water varying from 3 to 11 fathoms, and sufficient in several places to allow ships of the largest size to lie close to the shore. At the eastern end, under the heights of Inkermann, the river Tchernaya enters the harbour through low marshy ground. The South Bay, or Dockyard Harbour as it is also called, extends about one and a half miles from north to south, forms the harbour proper of S.; and between it and Quarantine Bay, occupying rather more than half the peninsula thus formed, is built the chief port of the town of S., on ground sloping irregularly upwards. The town, previous to its destruction in the siege of 1854—1855, was well and substantially built of stone, with lines of streets running from north to south, and smaller ones intersecting them at right angles, containing several handsome public edifices. The docks, constructed for the Russian government by Colonel Upton, an English engineer, were among the most important works at S.; the dock basin, docks, and quays were formed in the most substantial way, being part cut in the solid rock, and lined with cement, part built of limestone and granite. From the Dock Creek, ships were admitted into the Dock Basin by means of three locks, the bottom of the basin being above the sea-level, and the basin was supplied with water by a canal some 12 miles in length from the Tchernaya above Inkermann—a work of no inconsiderable magnitude. For the defence of town and harbour from attack by sea several forts were erected. These forts were works of immense strength, built of limestone faced with granite, on which artillery was found to rest but little impression; they mounted a very large number of guns, and by their cross-fire completely protected every spot accessible to a hostile fleet. On the land side, with the exception of a small loopholed wall extending partially round the western side, the town, previous to the siege, was entirely undefended; but the earthworks and fortifications were then successively extemporized by the genius of General Todleben, which for so many months kept the armies of France and England at bay, and of which the Malakoff and the Redan were the most formidable, are now of historic fame.

The siege of S. by the allied English and French armies will rank among the most famous events

history; it lasted for 11 months, from October 1854 to September 1855; the place sustained repeated bombardments, the first of which took place October 17, 1854; and the capture of the Malakoff and Redan, on September 8, 1855, at length forced the Russians to evacuate it, and retire to the north side. The town had been completely ruined; the docks and forts (such as were still standing) were afterwards blown up by French and English engineers. By the treaty of Paris (March 1856), the naval and military works are not to be restored. Before the siege, the population of S., including the soldiers and marines forming the garrison, amounted to about 40,000. Since that time the town has been partially rebuilt and reinhabited, but the population in 1867 was only 10,537. S. was intended to be the station of the Russian Black Sea fleet, and as such to form a standing menace to Turkey; during the siege, the fleet was almost entirely destroyed, many of the ships having been sunk by the Russians across the entrance of the harbour by way of defence. The great disadvantage of S. as a naval station arises from the ravages of the *Teredo navalis*, which soon render wooden vessels unseaworthy. S. was founded on the site of a small Tartar village called *Akkhar*, immediately after the Russian conquest of the Crimea in 1783, under the orders of the Empress Catharine II. The promontory on which S. stands is a spot of considerable classical and historical interest. Here, perhaps on the site now occupied by the Greek convent of St George, west of Balaclava, stood the temple of the Tauric Artemis, in which, according to the legend, Iphigenia, daughter of Agamemnon, was priestess. In later times, the promontory was colonised by Greeks from Heracles, in Asia Minor, and became known as the Heracleotic Chersonese. Two cities, successively built a few miles apart on the sea-coast to the west of S., have left remains existing to the present day. In after times, the Chersonesus fell into the power of the Genoese, who established their headquarters at Balaclava, where the remains of the 'Genoese castles' on the heights still bear witness to their rule. See *History of the Russian War* (W. and R. Chambers).

SEBENICO, a small port on the coast of Dalmatia, 42 miles south-east of Zara. It is built on a steep slope, and rises in terraces, and was formerly defended by walls and towers. Its cathedral, a fine edifice with a bold dome, was built 1443—1536. Its excellent harbour is defended by several forts. Pop. 14,238.

SEBESTEN, SEBESTAN, SEPISTAN, or S. PLUM, the fruit of the *Cordia Myxa*, a tree of the natural order *Cordiaceae*, a native of the East Indies. The tree has ovate leaves, and an egg-shaped fruit, which is succulent, mucilaginous, and emollient, with some astringency, and was formerly an article of the European *Materia Medica*, being employed for the preparation of a lenitive electuary and of a pectoral medicine. It is believed to be the *Persea* of Dioscorides. It has a sweetish taste, and is eaten by the natives of the Northern Circars of India, where it grows.

SECEDERS and SECESSION KIRK. See **UNITED PRESBYTERIANS**.

SECLUSION (of the Insane). This term has recently been narrowed so as to apply to the removal of the violent insane from the ordinary wards and fellowship of an asylum to an airing court, gallery, or room so situate and furnished that its solitary occupant can neither injure himself, nor injure nor

disturb others. Since the abolition of physical restraint by chains and strait-jackets, seclusion has become a favoured and useful mode of repression and treatment. That it should be resorted to exclusively as a remedial agent, and by the medical attendant, are now received as axioms. In 1854, the Commissioners in Lunacy in England ascertained, by circular, the opinions of almost all those intrusted with the care of the insane in that country, as to the employment of such means of cure; when it appeared that it was generally considered beneficial, if used for short periods and during paroxysms of epileptic and violent mania. Even when not absolutely required for the tranquillisation of the individual, seclusion may become expedient in order to secure the quiet, comfort, or safety of the patients with whom he is associated. That such an instrument may be abused and adopted from the parsimony, timidity, or ignorance of those around, is obvious. One of the lunatics liberated by Pinel, in 1792, had been incarcerated or secluded in his dark cell for forty years; and occasionally even now the duration of the isolation may be unduly prolonged even under medical sanction; but the instances of gross and cruel seclusion in garrets and cellars, and outhouses, are now chiefly to be found in private families, and where, as in the 'Flushing case,' no better course is known to be practicable.—*Eighth Report of Commissioners in Lunacy to Lord Chancellor*, App. C, p. 123; Bucknill and Tuke, *Psychological Medicine*, p. 582; Browne, *What Asylums Were, Are, and Ought to be*, p. 137.

SECOND (for the derivation of which see **SCRUPLE**) is the sixtieth part of a minute, whether of time or of angular magnitude. See **MINUTE**. In old treatises we find seconds distinguished as *minuta secunda*, from minutes, or *minuta prima*. The sixtieth part of a second was called a third, but instead of this and succeeding subdivisions, decimal fractions of seconds are now employed.

SE'CONDARY, in Geology, is the designation given to that large section of the fossiliferous strata which includes the Triassic, Oolitic, and Cretaceous rocks. It is synonymous with **Mesozoic**. The strata grouped under this title are separated from the inferior and superior deposits more by their organic contents than their petrological structure, and this separation is more evident between them and the older rocks, than between them and the newer; and yet recent discoveries have shewn that the St Cassian Beds form a connecting link between the Permian and Triassic epochs. They contain a series of fossils which are partly Palaeozoic and partly Mesozoic in their facies.

The appearance of the great types of all subsequent organisms in the Secondary rocks, has suggested the grouping of the fossiliferous strata in respect of their fossils into only two great divisions—viz., the Palaeozoic and the Neozoic—this last term including the Secondary and Tertiary periods.

SECONDDING is a temporary retirement to which officers of Royal Artillery and Royal Engineers are subjected when they accept civil employment under the crown. After six months of such employment the officer is seconded, by which he loses military pay, but retains his rank, seniority, and promotion in his corps. After being seconded for ten years, he must elect to return to military duty or to retire altogether.

SECOND SIGHT, a superstition or belief once common in the Scottish Highlands and Isles, where it was known by the Gaelic appellation *Taiseach*, signifying a spectral or shadowy appearance. Certain persons, called seers or wizards, were supposed to possess a supernatural gift, by which they

involuntarily foresaw future events, and perceived distant objects as if they were present :

As the sun,
Ere it is risen, sometimes paints its image
In the atmosphere, so often do the spirits
Of great events stride on before the events,
And in to-day already walks to-morrow.

WALLENSTEIN.

This is to depict the lofty and poetical view of the subject, as illustrated in classic fable and early history. The Highland seer, however, was chiefly conversant with the scenes and occurrences of ordinary life. 'A man on a journey far from home falls from a horse; another who is perhaps at work about the house, sees him bleeding on the ground, commonly with a landscape of the place where the accident befalls him. Another seer, driving home his cattle, or wandering in idleness, or musing in the sunshine, is suddenly surprised by the appearance of a bridal ceremony or funeral procession, and counts the mourners or attendants, of whom, if he knows them, he relates the names, if he knows them not he can describe the dresses. Things distant are seen at the instant when they happen' (Johnson's *Journey to the Hebrides*). With respect to things future, Johnson thought there was no rule for determining the time between the sight and the event; but Martin, whose account of the Western Islands was first published in 1703, furnishes data of this kind in his classification of the visions. If an object was seen early in the morning, the event would be accomplished a few hours afterwards; if at noon, the same day; and if at night, the accomplishment would take place weeks, months, and sometimes years afterwards, according to the time of night the vision was beheld. The appearance of a shroud was an infallible prognostic of death, and the nearness or remoteness of the event was judged by the amount of the body that was covered by the ghastly sheet; if it was not seen above the middle, a delay of a twelvemonth might be hoped for, but if it ascended high towards the head, the mortal hour was close at hand. 'The vision makes such a lively impression upon the seers,' says Martin, 'that they neither see nor think of anything else except the vision, as long as it continues; the eyelids of the seer are erected, and the eyes continue staring until the object vanish.' The power of the seer was involuntary and painful—it was no source of gain. The gradation of symbolical appearances we have mentioned, strikes the imagination and gives something like a system to the supernatural phenomena. But if we turn to the cases described by the historians of the second sight, we do not find such regular order and exactness. The evidence is vague and confused, and the incidents are often of the most trivial character. The revelations, indeed, were commonly made to poor illiterate men, predisposed from the very nature of the country—wild, dreary, and remote—and from their half-idle, solitary life, to melancholy and superstition. These causes must have led very early to belief in the second sight. We find it colouring portions of the history of Wallace and Bruce, and associated with the tragic fate of the accomplished James I. of Scotland. A Scottish seer is said to have foretold the unhappy career of Charles I., and another the violent death of Villiers, Duke of Buckingham. In 1652, a Scottish lawyer, Sir George Mackenzie, afterwards Lord Tarbat, when driven to the Highlands by fear of the government of Cromwell, engaged himself in making inquiries concerning this supposed supernatural faculty, and wrote a minute account of its manifestations addressed to the celebrated Robert Boyle, which, with other relations on the same

subject, is published in the correspondence of Samuel Pepys. Next came Martin's copious description; then a Highland minister, the Rev. John Fraser of Tyree, collected *Authentic Instances*, which were printed in 1707; and in 1763, appeared the ambitious treatise of *Theophilus Indusius*, or Macleod of Hamir, which contained the narrative of Fraser, of Aubrey the English antiquary, and other authorities, with the addition of a great number of cases—nearly a hundred—gathered by himself from various sources, and also numerous letters from Highland ministers. This work exhausted the subject, but the wretched vanity, credulity, and weakness of Theophilus covered it with ridicule. A fresh revival took place after the memorable *Journey to the Hebrides* by Dr Johnson, whose work was published in 1775. The second sight was sure to interest a melancholy, meditative 'rambler' like Johnson. He had read of it in his youth in Martin's History. He was naturally superstitious. He had a stout courageous heart, but he had a morbid fear of death, and an almost childish eagerness to pierce the darkness of futurity, and to believe in the possibility of messages from the other world. Johnson anxiously questioned the clergy and others respecting the supernatural communications made to the seers, and would gladly have believed them real. The evidence, however, was not complete or invincible; and with that of truth, which was one of the strongest virtues of the sage of Bolt Court, he confessed that he could not 'advance his curiosity to conviction, but was away at last only willing to believe.' On one occasion we find Johnson enunciating the true doctrine in such cases. He observed, as Boswell reports, that 'we could have no certainty of the truth of supernatural appearances unless something was told us which we could not know by ordinary means; something done which could not be done but by supernatural power; that Pharaoh, in regard to justice, required such evidence from Moses; that our Saviour said: "If I had not done as these men the works which none other man did, they would not have believed in me, though I should perform more miracles than the prophets." Undoubtedly works or facts, and not merely appearances, are required for conviction. Spectral sights may be caused by dreams or delusions (see APPARITIONS), by accidental optical illusions, or by the workings of a vivid imagination. It is degrading to the idea of divine power to suppose that special miracles were wrought to announce the marriage or death of a Highland peasant, the wreck of a boat, or the arrival of a stranger in a remote island of the Hebrides. Ignorance is a great cause of superstition, as solitude is of gloomy egotism and melancholy; and since education has penetrated into the Highlands and Isles, and intercourse with other parts of the kingdom has been facilitated by increasing trade and improved means of communication—to say nothing of the effects of that passion for Highland scenery and sport which every year takes crowds of visitors to the country—the belief in second sight, as in astrology and witchcraft, has almost wholly disappeared from the land. It has had the cruel, hard, and revolting features of witchcraft—formerly prevalent in the Lowlands which are scarcely known in the Hebrides—and it still seems picturesque enough to serve for the purposes of poetry and romance.

SECRET (Lat. *secretus*, i.e., *oratio*, the secret prayer), one of the prayers of the Mass (q.v.) of the same general form with the 'Collect,' but recited by the priest in so low a voice as not to be heard by the people, whence the name *secretus* is derived. It follows immediately after the oblation of the Eucharistic bread and wine. This use of silent prayer is

the public service is one of the subjects of controversy between Catholics and Protestants.

SECRET, DISCIPLINE OF THE (Lat. *Arcani Disciplina*), a discipline of the early church, founded upon the words of Christ, 'Give not that which is holy to dogs,' Matt. vii. 6, in virtue of which Christians fully initiated in the doctrine and practice of the church withheld from pagans and catechumens in the preparatory stage the knowledge of certain doctrines, and the liberty of presence at certain rites connected with the most solemn mysteries of the Christian religion. This practice originated in the obloquy which was drawn upon the doctrines of the church from the false and monstrous conceptions of these doctrines which were circulated among pagans. Against these calumnious misconceptions the earliest of the so-called 'Apologies' are addressed; and it seems certain that at the time at which Justin wrote his first Apology, the middle of the 2d c., no objection existed against speaking openly of the mystery of the Eucharist.—(See *Justin Apol.*, i. 66). Very soon after this, however, the 'Secret' is clearly traceable. The first reason for its adoption was that assigned above—namely, to guard the more sacred and mysterious doctrines from popular misconception and blasphemy among the pagans. This precaution of concealment was extended to catechumens, partly in order to avoid shocking too suddenly their half-formed convictions by the more startling improbabilities of Christian belief; partly also, no doubt, to guard against the danger of the betrayal of these mysterious doctrines to pagan spies approaching in the false garb of catechumens. The Discipline of the Secret appears in several forms—(1.) Both unbelievers and catechumens were removed from the church at the commencement of that portion of the liturgy which specially relates to the celebration of the Eucharist—the so-called *Missæ Fidelium*. See MASS. (2.) The lectures addressed by the presiding teacher to the great body of the catechumens in general were confined to the general doctrines of Christianity. The more mysterious doctrines, those which regarded the sacraments of Baptism and the Eucharist, called 'Mystagogic,' were only communicated at the close, and to those only who had undergone the preliminary probation. (3.) The Eucharist, if referred to at all in the presence of the uninitiated, was spoken of in words so conceived as to conceal its nature. Many curious examples of this concealment might be cited. Irenæus, alluding to the Eucharist (Hom. 8, in Exod. 1), says merely: 'The initiated know what I mean.' When Chrysostom was writing to Pope Innocent I. an account of a tumult in the church at Constantinople, in which the sacred cup was upset, and the consecrated elements spilled, he says, without reserve, 'The blood of Christ was spilled.' But Palladius, the deacon, in his *Life of Chrysostom*, which was designed for the pagans as well as for the Christians, takes the precaution to use the words 'The symbols which are known to the faithful.' Still more curiously, Epiphanius, in citing the well-known words of the Eucharistic formula, 'This is my body,' suppresses the word under which the mysterious idea is contained, and writes, 'This is my that thing.' *Touto mou esti tode*. A very curious example of this amphibological language regarding the Eucharist will be seen in a Greek inscription discovered some years since at Autun, in France.—(See *Edin. Rev.*, July 1864).

There is some uncertainty as to the period during which this discipline lasted in the church. It commenced most probably in the time of Justin, as his contemporary, the heretic Marcion, is known to have protested against it as an innovation (Neander's *Kirchen-geschichte*, i. 540). It is even thought not

impossible by some that Justin's mode of writing was an exceptional one, and that the Secret may have been in use before his time. On the other hand, it is certain that it outlived the period out of the condition of which it arose, and was maintained long after the ages of persecution. The traces of it had not entirely disappeared in the 6th century.—(See Schelstrate, *Diss. de Discip. Arcani*, 1685; Scholliner, *Diss. de Discip. Arcani*, 1756; and on the Protestant side, Tenzel, *De Discip. Arcani* (in reply to Schelstrate); Rothe, *De Disc. Arcani*, Heidelberg, 1831.)

SECRETARY, SECRETARY FALCON, SECRETARY BIRD, or SERPENT-EATER (*Gypogeryon*), a genus of birds of prey, which has been variously placed by naturalists among the *Falconidae* and the *Vulturidae*, and has been also constituted into a distinct family, *Gypogeryonidae*. The legs are very long, as in the *Grallæ*, to which, however, there is no other resemblance. The *tibiae* are completely feathered, but the *tarsi* and toes are destitute of feathers. The tarsi are covered in front with long, large scales. The toes are armed with sharp claws; but they are short, and the feet are not formed for grasping. The hind-toe is very short. The neck is much longer, and the whole form of the bird more slender than in the *Falconidae*. The wings are long, and armed with a blunt spur at the shoulder. The tail is very long. The best-known species is an inhabitant of the arid plains of South Africa. It is about three feet in length; the plumage bluish-gray. It has an occipital crest of feathers without barbs at the base, which can be raised or depressed at pleasure, and the name Secretary was given to it by the colonists at the Cape of Good Hope from their fancied resemblance to pens stuck behind the ear. It feeds chiefly on reptiles of all kinds, which it devours in great numbers, and is so highly valued on account

Secretary Bird (*Serpentarius secretarius*).

of the constant war which it wages against serpents, that a fine is inflicted in the Cape Colony for shooting it. It fearlessly attacks the most venomous serpents, stunning them with blows of its wing, also seizing and carrying them into the air to such a height that they are killed by the fall. It uses its feet also to overpower its prey, striking violent blows with them. Small serpents are swallowed entire; the larger ones are torn to pieces. The S. is most frequently seen in pairs, or solitary. It is tamed as a protector of poultry-yards; but if not sufficiently fed, is apt to help itself to a chicken

or duckling. An attempt has been made to introduce this bird into Martinique, in order to reduce the number of venomous serpents in that island.—Another species of S. appears to exist in more northern parts of Africa, as about the Gambia; and a third, more widely different, in the Philippine Islands.

SECRETARY OF THE NAVY is the conventional title of the parliamentary secretary to the Board of Admiralty. This post is conferred on a ministerial supporter, in the House of Commons, in which, when the First Lord of the Admiralty is a peer, he is the exponent of naval policy. He changes of course with the ministry, of which he is a subordinate member; and receives a salary of £2000 a year. There is also a permanent secretary, who holds office for life, and receives £1500 a year. He is responsible for the discipline of the Admiralty Office. This appointment is of long standing, and was held by the celebrated Mr Secretary Pepys.

SECRETARY-AT-WAR, formerly a high officer of the British ministry, had the control of the financial arrangements of the army, and was the responsible medium for parliamentary supervision in military affairs. In the times of the Tudors, the war business of the country appears to have been transacted by the department of the Secretary of State. The formation of a war office proper took place about 1620. The office rose in importance as the army increased; but was limited to financial authority, neither the commander-in-chief nor master-general of the ordnance being subject to it. At length, during the Russian war, the evils of this divided authority led to the creation of a Secretary of State for War, to control all the military departments. The secretaryship-at-war was merged in this superior office in 1855, and though for some years preserved technically as a separate appointment held by the Secretary of State, was abolished by act of parliament in 1863.

SECRETARY OF EMBASSY or of **LEGATION**, the principal of the persons belonging to the suite of an ambassador or envoy. Secretaries of Embassy or Legation hold their commission immediately from the sovereign, who nominates them in general only to ministers of the first and second rank. They are therefore considered a species of public minister; and independently of their attachment to an ambassador's suite, they enjoy in their own name all the privileges and protections of the diplomatic character. They are generally presented in person to the foreign sovereign at whose court they are accredited. The functions of a secretary of embassy or legation consist principally in assisting the chief in the business of the embassy. Moser (*Versuch* Th. iii. p. 94) says: 'An ambassador is often only like the hands of a watch, while his secretary resembles the works.' Secretaries of embassy and legation occupy the post of ambassadors and envoys during the absence of their ministers. A secretary of embassy or legation must not be confounded with the private secretary of an ambassador appointed and paid by him, who has none of the privileges and immunities above-mentioned.

SECRETARY OF STATE, an ancient and important office in the government of England. The oldest record of its existence is in the reign of Henry III., when John Maunsell is described as 'secretarius noster.' Prior to the Restoration, the holder of this office was generally styled the 'king's chief' or 'principal secretary'; he had the custody of the king's signet, and discharged his duties with the assistance of four clerks. Two

secretaries are said to have been first appointed towards the close of the reign of Henry VIII. In office, always one of influence, gradually grew in importance. On the Union of 1707, Anne appointed a third secretary of state for Scotland, which, however, was soon done away with. In the reign of George III. there were at first but two secretaries; for a time there was a third for America, but his office was abolished by statute in 1763. While the secretaries were two in number, but equally directed home affairs; to the one was committed the foreign affairs of the northern, to the other of the southern department. Irish affairs belonged to the province of the elder secretary.

There are now five principal secretaries of state, who are respectively appointed for home affairs, foreign affairs, war, the colonies, and India. They are all appointed by the sovereign by the delivery of the seals of office, without patent, and are always members of the Privy Council and of the Cabinet. Though each has his own department, he is considered capable of discharging the duties of the others; a member of the House of Commons removed from one secretaryship to another, does thereby vacate his seat.

The Secretary of State for the Home Department has the charge of the maintenance of the peace of the United Kingdom, the security of the laws, and the administration of justice, so far as royal prerogative is involved in it. He directs the disposal and employment of the regular troops at home, and provides for the suppression of crime. The militia, yeomanry, and volunteers are entirely under his control. He has the ultimate supervision of all that relates to prisons and criminals, and numerous statutory powers have been conferred on him regarding police, sanitary matters, the regulation of labour, &c. All patents, licences, dispositions, charters of incorporation, commissions of peace and of inquiry, pass through his office. He recommends persons to the Sovereign for knighthood, and is empowered to grant certificates of Naturalisation (q. v.) to foreigners. He is the organ of communication between the cabinet and the viceregal government of Ireland, for which he is responsible, and is informed of and advises the graver measures adopted in that country. His patronage is very considerable, including the nomination to a large number of judicial offices. And the powers of the Secretary of State in committing persons on suspicion of treason to a function which, though its legality has been in question, has been often exercised.

The Secretary of State for Foreign Affairs is the responsible adviser of the crown in all communications between the government and foreign powers. He negotiates treaties, either directly with the foreign ministers resident in the country, or through the British ministers abroad. It is his duty to inquire into the complaints of British subjects residing in foreign countries, to afford them protection, and to demand redress for their grievances. The Foreign Secretary recommends to the Sovereign all ambassadors, ministers, and consuls to represent this country abroad. He grants Passports to British subjects and naturalised foreigners.

The Secretary for the Colonial Department has the supervision of the laws and customs of the colonies, watches over their interests, directs the government, apportions the troops necessary for their defence or police, appoints the governors of the colonies, and sanctions or disallows the measures of the colonial governments, rarely, however, prescribing measures for their adoption.

Each of these four secretaries of state is assisted by two under secretaries of state nominated by

SECRETION—SECRECTIONS.

himself—one usually permanent, while the other is dependent on the administration in power.

The Secretary of State for India, whose office dates from the abolition, in 1858, of the double government of India by the Court of East India Directors and Board of Control, has the same control over the government of India which was formerly exercised by these bodies, and countersigns all warrants and orders under the sign-manual relating to India. He is assisted by an under-secretary, who is also a member of the legislature, and loses office with the cabinet, and by a permanent under-secretary and assistant-secretary, as also by a council of fifteen members, over whom he presides. Every order sent to India must be signed by the secretary, and all dispatches from governments and presidencies in India must be addressed to the secretary.

There is also a Chief Secretary for Ireland, resident in Dublin, except during the sitting of parliament, and under the authority of the Lord-lieutenant. His office resembles that of a secretary of state, but he is generally called Secretary to the Lord-lieutenant. He is assisted by an under-secretary.

The Secretary of State for War (see SECRETARY-AT-WAR) has the superintendence of all matters connected with the army, assisted by the commander-in-chief, and is responsible for the amount of the military establishment. He prepares for the royal signature and countersigns commissions in the army, and recommends to the sovereign for the order of Knighthood of the Bath.

SECRETION is the term employed in Physiology to designate the process of *separation* of those matters from the nutritious fluids of the body which are destined not to be directly applied to the nutrition and renovation of its organised fabric, but (1.) to be either at once removed as injurious to its welfare, or (2.) to be employed for some ulterior purpose in the chemical or physical processes of the economy itself, or to exert some kind of action upon other beings. For this definition of secretion considered as a process we are indebted to Dr Carpenter; but the reader must bear in mind that the term is also very commonly used in another sense—namely, to designate the *products* which are thus excreted. In this latter sense, it is customary to speak of the biliary, urinary, or cutaneous secretion, when the bile, urine, and sweat are indicated.

Although it is impossible to divide with strictness the secreted products (as many physiologists have attempted to do) into the *excrementitious* and the *recrementitious*—that is to say, into (1.) those which have no further function to discharge in the animal body, and which, if not excreted, would act as poisons, and (2.) those which are subservient to further uses in the system—yet we may group them according to the preponderance of their excrementitious or recrementitious character. Dr Carpenter approves of this mode of arrangement, and proposes that those secretory processes should be arranged in the first division in which the depuration of the blood is obviously the chief end, while those should be placed under the second in which the ulterior purpose of the separated fluid would seem to be the principal occasion of its production; and he further suggests a subdivision of this second group, according as this ulterior purpose is connected with the operations of the economy itself, as in the case of the *ars*, the *saliva*, the *gastric juice*, &c., or is destined to act on some other organism, as is the case with the secretion of the *testes*, the *milk*, &c. The organs which yield the various secretions are termed *glands* (q. v.); but neither the form nor the internal arrangement of the parts of a gland have any

essential connection with the nature of its product; the true process of secretion, under whatever form it may present itself, being always performed by the intervention of Cells (q. v.). For a notice of the mode in which the cells are arranged in various glandular structures, the reader is referred to the articles **GLAND**, **LIVER**, **KIDNEY**, **MUCOUS MEMBRANE**, &c.

We shall now briefly notice the causes which render the due performance of the functions of secretion essential to the well-being of every animal. 1. Nearly all the solids and fluids of the body are liable to continuous decomposition and decay in consequence of their peculiar chemical composition. There is an obvious necessity that the products of incipient decomposition should be carried off and replaced by newly-organised matter. 2. The exercise of the various animal functions is essentially destructive to the structures by which they are accomplished; every operation of the muscular or nervous system appearing to require, as a necessary condition, a disintegration or breaking up of a certain portion of their tissues, probably by an act of oxidation. Hence, for the due preservation of health, the disintegrated or effete matters must be removed, and their place supplied. 3. When more food is taken than the wants of the system require, all that is not appropriated to the reparation of the waste, or to the increase in the weight of the body, must be thrown off by the excretory organs without ever having become converted into organic tissue. If this excess were not speedily removed by the excretory organs, the current of the blood would speedily become poisoned.

The following may be regarded as a tolerably complete list of the substances which are produced within the organisms of man and the lower animals by the disintegration of its various tissues, and which are met with in one or other of the products of secretion: 1. Products of secreting processes, including *a*, the biliary acids and the products of their disintegration; *b*, the pigments of the bile; *c*, pigments allied to those of the bile and blood, viz., *hematoidin* and *melanin*; *d*, *cholesterin* and its allies; *e*, the sugars and allied bodies. 2. Products of the actual regressive metamorphosis of tissues—*a*, nitrogenous amide-like bodies, such as *leucine*, *tyrosine*, *creatine*, *creatinine*, *allantoin*, *cystin*, *guanine*, *sarcine*, *xanthin*, and *urea*; *b*, nitrogenous acids, as *hippuric*, *uric*, and *cynuric acids*; *c*, indifferent nitrogenous bodies, such as the pigments occurring in the urine; and *d*, non-nitrogenous acids, as *acetic*, *benzoic*, *butyric*, *carbonic*, *formic*, *lactic*, *oxalic*, *succinic*, and *valerianic acids*. Some of these products, however, only occur in the secretions in cases of disease.

SECRECTIONS, VEGETABLE. In the vegetable kingdom, the term *secretion* has a wider application than in the animal kingdom, and all substances which have been formed by the action of cells upon the compounds taken up as food (such as *carbonic acid*, *water*, and *ammonia*)—whether these substances form a part of the tissue of the plant, or are thrown out upon its surface—are equally considered as secretions. All the important vegetable secretions are compounds of carbon, hydrogen, oxygen, and nitrogen; sulphur being also present in some cases; and according to their functions they may be classed in two great divisions—viz., (1.) nutritive or assimilable secretions, and (2.) non-assimilable or special secretions.

1. The *nutritive secretions* are those substances which, having been formed within the plant, are used in forming its structures and constructing its general mass. The chief substances in this class are *cellulose*, the varieties of *starch*, the varieties of

sugar, the oils, and the so-called protein or albuminous bodies. The composition of these substances is extremely varied; thus, many of the volatile oils or essences contain only carbon and hydrogen; the sugars, starches and cellulose, contain carbon, hydrogen, and oxygen, and are named ternary compounds; while the protein bodies contain carbon, hydrogen, oxygen, and nitrogen, and, in some cases, sulphur.

2. The *non-assimilable* secretions are only found in certain parts of the plant, and they receive their name from their never being converted into the nutritive secretions. The principal members of this class are the colouring matter of plants (chlorophyll and its modifications); the substances which, when extracted from plants, are of service as dye-stuffs (the *chromogens* or colour-formers of recent chemists); the organic acids, which constitute a somewhat numerous group, and of which oxalic acid (occurring in rhubarb, sorrel, &c.), tartaric and racemic acids (in the grape), malic acid (in the apple and gooseberry), citric acid (in the orange, lemon, lime, and red currant), gallic acid (in the seeds of the mango), meconic acid (in the opium poppy), and tannic acid (in the bark of the oak, elm, &c.), may be taken as well-known examples; the vegetable alkalies or alkaloids, such as morphia, strychnia, quinia, &c.; and the volatile oils; and the resins.

SECRET WRITING, or SYMPATHETIC INK. See **INK**.

SECO'LE, a small town of Bengal, British India, three miles north-west of Benares, contains most of the civil establishments, the military cantonments, and the residences of most of the British population connected with Benares. The residences or bungalows are handsome and substantial, but are scattered about among the groves and gardens which surround the military cantonments. The latter, which are capable of containing three or four regiments, are traversed by a small stream, the Burnah Nuddee. Among the public buildings are a Christian church and chapel, a court of justice, the treasury, the jail, and a mint. S., which may be considered as the British quarter of Benares, was the headquarters of the Benares division of the Bengal army, and here, on the 4th June 1857, the 37th Bengal Native Infantry, the 13th Irregular Cavalry, and a portion of the Loodianah Sikhs, in all 2000 men, mutinied; but being charged by Colonel (afterwards Brigadier-general) Neill at the head of 240 men of the Madras and Queen's armies, and a few faithful Sikhs and Irregulars, they were compelled to take to flight with the loss of about 200 men, after killing two of their own British officers and two privates of Neill's force.

SECTION, in Architecture, the delineation of buildings on a vertical plane through any part of them—as a *plan* is the horizontal projection. Sections are of great use in practice in shewing the thickness of walls, the construction of floors, roofs, &c., and the forms and dimensions of every part of the interiors of buildings. Sections may also be used to shew the furniture, drapery, &c., of rooms. These are called furnished sections. All mouldings, cornices, &c., are drawn in section or profile, full size, for the guidance of the workmen.

SECTOR, in *Geometry*, is a portion of a circle included between two radii and the intercepted arc of the circumference. The area of a sector is equal to that of a triangle whose base is equal in length to the intercepted arc, and whose perpendicular height is equal to the length of the radius.

SECTOR, in *Practical Mechanics*, an instrument of considerable utility in rough mathematical drawing, consists of two strips of wood, ivory, or metal jointed together like a carpenter's foot-rule.

It is absolutely necessary for the correctness of the instrument that the centre of the axle of the joint should be accurately at the inner corner of the slip (as shewn in the figure), so that it will always be the vertex of a triangle of which the inner edge

(and consequently any of the corresponding pairs of lines drawn from the joint obliquely along the rule) form the two sides. These oblique lines, which are drawn on both sides of the instrument, and converge from the extremities of the two strips to the centre of the joint, are graduated in different ways, so as to give, on each limb, a line of equal parts, a scale of chords, scales of sines, tangents, and secants, a line of polygons, &c. (all of which are graduated from the centre of the hinge, which is their zero point), besides a number of common scales on the blank portions of the sector. The special use of this instrument is in the finding of a fourth proportional to three given quantities, and the operation is performed as follows:

If the fourth proportional to 18, 16, and 5 is required, find the graduation indicating 18 on each limb; then obtain, by means of a pair of compasses, the length from 0 to 16, and draw out the instrument till the two 18 points are as far apart as the distance given by the compasses; then, by measuring with the compasses the distance of the two graduations indicating 16, and applying the compasses to the scale, we obtain the fourth proportional required. It will be seen that this instrument merely supplies a mechanical mode of constructing two similar isosceles triangles, one of which has all its sides, and the other only its equal sides given, the other sides of which is formed by the sector, and read off by the compasses and scale, being, from the nature of similar triangles, the fourth proportional required. This instrument becomes more useful as the angle formed by the limbs increases. The sector is said to have been invented by Simon Stevin about 1568, though Gaspar Middelburg Antwerp describes it in 1584, and attributes the invention to his brother Fabricius in 1534. It is described by several German and English writers in the same century, and again by Galileo, who claimed to have invented it in 1604.

SECULAR CLERGY. See **CLERGY**.

SECULARISM is the term applied to a system of ethical principles begun to be advocated in 1846 by G. J. Holyoake. As the system has a considerable number of adherents, and has been seldom into public notice, a brief account of its leading doctrines is here given. As in similar cases we allow a believer in the doctrines to speak for himself.

The Secular is defined as that which pertains to this life, and is treated as a thing apart, independent of, rather than as necessarily opposed to, any other mode of thought and duty. Secularism, as regards opponents, claims that to ignore the spiritual is to deny. As the geometrician ignores metaphysics, without a thought of denying the world, so secularism, which concerns itself with the world, refuses to be held as conflicting with the 'other-worldliness,' which, if demonstrable, is based on an experience to which secularism must

SECULARISM.

no pretension, and towards which it considers itself to incur no responsibility. Secularism commences by laying down the proposition that intelligent sincerity is sinless. It does not maintain that even intelligent sincerity is errorless, but that it is without conscious guilt, even when it is, as it may be, dangerously mistaken. The conscience thus educated, Thought may be intrusted to inquire, and the search for Truth may be begun.

Secularism takes the term Free Thought as expressing the central idea which it inculcates. It defines Free Thought as the unrestricted application of the powers of the intellect to any subject—the absence of any threat or penalty, legal, spiritual, or social, for the exercise of thought. The Free Thought it inculcates is not lawless thought; it is guided by methods of logic, limited by evidence checked at every step by experience, which is omnipresent, and corrected by the results of science. Free Thought is not the rebellion, but the judicial action of the understanding. Reason—the faculty of following the pathway of facts—does not despise intuition, nor instinct, nor the voice of nature, nor authority; it uses, but revises them; it does not pretend to be infallible, but to be the best arbiter we have. To the conception of Free Thought is also necessary the Free Publication of Opinion; for no one could profit by the thought of other minds unless it was freely communicated. Hence the diffusion of thought becomes an obligation on each thinker, and silence or supineness a social crime. Again, Free Thought that would command respect must be submitted to Free Criticism. Thought is often foolish, often mischievous, and sometimes wicked, and he alone who submits it to free criticism gives guarantees to society that he means well, since by criticism comes the exposure of false or foolish opinions; and the right of criticism is the sole protection of the public from error. Free Thought must end in the Free Action of opinion, since he thinks to no purpose whose thought is inapplicable to conduct; and he withholds the sign of his own sincerity who does not unite his thought with action. Such is that education in Free Thought which secularism attempts.

It holds that Scepticism is the pathway to affirmative truth. So far from being a crime, scepticism is scrutiny. So far from being the end, it is the beginning of inquiry—the first condition for the recognition of unknown truth. He who would be master of his own mind, and know what is in it, and who would have no principles there but those which are pure, true, and reliable, must refuse to believe anything until he is compelled to believe it; being no more safe to keep one's mind open to all notions, than to keep one's door open to all comers. It is clear that the use of Free Thought may be a nuisance, a terror, or an outrage, unless Courtesy takes care of it. Therefore secularism provides that advocacy shall be directed to the exposure of error and the elucidation of truth, without moral imputation upon those whose opinions are controverted; and contends that all advocacy, wanting in consideration towards others, shall be regarded as a crime against Free Thought. The quality of the thought, and not the motive of it, is the proper and sufficient object of discussion.

Secularism further imposes upon the action of Free Thought the limit that every one shall concede to others the liberty he claims for himself, and shall permit to others, and shall recognize in each individual, 'liberty of action in all things by which others are neither injured nor benefited.' Secularism, regarding the one object of all Free Thought as the attainment of truth, is in the study of nature its immediate sphere of exercise. Free Thought is prompted by a desire to

fathom the knowable; and nature and human life are the immediate sources of truth and duty, which it most concerns man to master. Therefore respect for this life, respect for pure physical conditions, respect for the moral capacity of human nature, are conditions of secular belief. Secularism is not committed to denying that there is other good—it does not meddle with that question; it says whether there be other good or not, the good of the present life is good, and it is good to seek that good. It holds that the secular is sacred, and seeks 'to find that material condition in which it shall be impossible for man to be depraved or poor.' It does not say that all things are material, or that there are no spiritual agencies; it does not enter upon these propositions, but confines itself to shewing that there are material agencies in this life, whatever else there may be, and that these, as far as they can be discovered, are the calculable forces of the world, which cannot be neglected without folly or hurt, and that it is wisdom, mercy, and duty to attend to them. Without entering upon the question of the interference of Providence, secularism contends that Science is practically the providence of life; that conscience is higher than consequence; that deliverance from calamity is more merciful than any system of consolation which only acts when calamity has occurred; and that it is not the pursuit of happiness, but the performance of duty, which is the end of life. Secularism proceeds in the path of Positive Philosophy, not seeking for errors but for truth; not busying itself with negations, but with affirmations. In sacred writ it seeks for guiding truth and thought which commends itself to reason and experience, accepting the intrinsically true, without entering upon the vexed questions of inspiration or authenticity. Whatever principles secularism inculcates, they are affirmative in their nature, relate to the welfare of humanity, and are determined by considerations purely human.

There is unquestionably a vast outlying class in every European country, and especially in our Indian territories, who are without the pale of Christianity. They reject it, they dislike it, or they do not understand it. Secularism is intended for these, and for all who find theology indefinite, or inadequate, or deem it unreliable. The object of secularism is to afford these classes a knowledge of principles addressed to their common reason and intelligence, by an appeal to principles of a secular nature, common to humanity in every state and clime. It may be a misfortune that the principles of theism, or the acceptance of the Bible, cannot be rendered promptly acceptable to them. Since, however, this is not the case, it must be of advantage to interest them in rules calculated for the moral guidance of their conduct. Upon these Christianity may be, if shewn to be tenable, subsequently superinduced. The principles of secularism are intended to constitute an education of the working-classes, which begins with their reason, grows with their intelligence, and ends only with death.

Secularism is not an argument against Christianity, it is one independent of it. It does not question the pretensions of Christianity; it advances others. Secularism does not say there is no light or guidance elsewhere, but maintains that there is light and guidance in secular truth, whose conditions and sanctions exist independently, act independently, and act for ever. Secular knowledge is manifestly that kind of knowledge which is founded in this life, which relates to the conduct of this life, conduces to the welfare of this life, and is capable of being tested by the experience of this life. Geometry, Algebra, Botany, Chemistry, Navigation, Political Economy, Ethics, are secular subjects of

instruction (distinct albeit from secularism which includes the education of the conscience). They are founded in nature, they relate to the uses of this life, promote the enjoyment of this life, and can be tested by personal experience. That which is secular can be tested in time; that which is theological is only provable after death. If a sum in arithmetic is wrong, it can be proved by a new way of working it; if a medical recipe is wrong, the effect is discoverable on the health; if a political law is wrong, it is sooner or later apparent in the disaster it brings with it; if a theorem in navigation is erroneous, delay or shipwreck warns the mariner of the mistake; if an insane moralist teaches that adherence to the truth is wrong, men can try the effects of lying, when the disgrace and distrust which ensue soon convince them of the fallacy; but if a theological belief is wrong, we must die to find it out.

The standard of secularism is utilitarian. Utility is made the test of right, not the utility which is sensual and selfish, but that which takes into account the highest attributes and noblest aspirations of humanity (see UTILITARIANISM). It is not the agent's own happiness, but the happiness of others which the utilitarian is bound to promote. The adoption of this rule makes intelligence a necessity. Secularism is not sceptical. It seeks everywhere positive truth, and regards doubt as a difficulty and a danger. It is not infidel, for that is a state of mind treacherous to the truth, and truth is the first thing to which secularism teaches allegiance. It is not atheistic, atheism being alien to secularism, which concerns itself with the affirmative. Secularism might call itself religious, if it were allowable to use the term without including some distinctive theory of theism, which is equally excluded from the subject-matter of secularism, as not coming within the region of positive knowledge. Nothing in secular morals can be insisted upon with effect, save those statements which appeal to the common experience, and with which you can dare the judgment of mankind; but if that may be called religious, which appeals to demonstrative intelligence, which addresses itself to the conscience, which inculcates love, and truth, and justice; which claims service and endurance from all men; which places happiness in duty, and makes the service of humanity the one object of life, and the source of consolation in death, then secularism may be so defined, and in this sense it has been described in the following definitions:

Secularism is the religion of the present life: it teaches men to seek morality in nature, and happiness in duty; guiding the conduct and educating the conscience of those who do not know, or who, from conscientious conviction, stand apart from Christianity. Secularism teaches a man to acquit himself well in this world as the purest act of worship, to study the truth, to judge by reason, to regulate human interests by considerations purely human, and to act on that rule of utility which conduces to the greatest good of others; thus endeavouring to deserve another life by the unhesitating, unrelenting pursuit of duty in this.

SECUNDERÁBAD (more correctly Sikan-darábád), a large town, and an important British military cantonment in the Nizam's Dominions, India, six miles north of Haidarábád. On the north-east are two singular granite hills, large, hemispherical in shape, completely isolated, and having on their summits the tombs of Fakirs, which are visited by a great number of pilgrims each year. The cantonment consists of a curved, irregular street, three miles in length, with the officers' houses ranged on either side. There are

numerous barracks, and good hospital accommodation. There are numerous tanks in the vicinity, and the water is good. The mean annual temperature is 81° 30', and the climate is unhealthy—though less so now than formerly—during the rainy season. Pop. of S., 40,000.

SECURITY, in Law, means some deed affecting real or personal estate, the object of which is to secure the payment of a primary debt. Such as Bonds (q. v.) and Mortgages (q. v.).

SEDAN, a manufacturing town and frontier town of France, in the dep. of Ardennes; pop. in 1872, 13,501. In 1646, Colbert founded here the first of his famous cloth factories; and the town of S. have now a European reputation, and employs many hands. There is also extensive industry in various branches of metallurgy; and there are coal and iron mines in the vicinity. The fortress of S. has played a considerable part in military history, and it has recently become noted as the place where (September 2, 1870) Napoleon III. and an army of 90,000 men surrendered to the Prussians.

SEDAN CHAIR, a portable covered vehicle for carrying a single person, borne on two poles by two men. The name is derived from the town of Sedan in the north of France, where this species of conveyance is said to have been invented. It is said that the Duke of Buckingham was in the practice of using one in the reign of James I., a proceeding which gave general offence, it being made matter of public remark, that this royal favourite used to fellow-countrymen to do the work of beasts. The general introduction of sedan chairs into England dates from 1634, about the same period that hackney coaches came into use. Sedan chairs were largely used during the greater part of last century, and found very well adapted for transporting persons in full dress, to public and private entertainments. Not only were there numerous public conveyances of this kind in London and all considerable towns, but the owner of every large mansion had a private sedan handsomely fitted up. In England, a century ago, sedan chairs were far more numerous than hackney coaches, and were almost entirely in the hands of Highlanders. Sedans are now seldom used except for the transport of the sick.

SEDATIVES are medicines which exert a direct or primary depressing action upon the vital powers without inducing any subsequent excitement. In diseases in which sedatives are employed are distinguished those of over excitement of the nervous and circulating systems; and as some of the members of this class (hemlock, for example) act directly on the nervous system, while others (foxglove, for example) more immediately act upon the heart, it is necessary to be able to determine the kind of sedative suited for each individual case. Inflammatory fever presents all the conditions in which sedatives are found to be of service. 'The excited heart, elevated temperature, hard and unyielding pulse, and the disordered state of the special nerves, call for the administration of remedies fitted to appease the excited energy, and the great improvement which in such a case, follows the use of blood-letting, emetic, and digitalis, bears evidence to the correctness of our practice.' (Ballard and Garrod's *Elements of Materia Medica*, p. 11.) The following are the most important members of this class, some of which are boric acid (applied locally in cases of urinary bladder or womb, or to painful ulcers), chloroform (especially when inhaled), conium, digitalis, hyocyane acid, and tobacco.

SEDGE. See CARP.

SEDGWICK, an American family, distinguished in politics, law, and literature.—THOMAS

statesman and jurist, was born at Hartford, Connecticut, May 1746. He was descended from Robert Sedgwick, a major-general of the army of Cromwell. Educated at Yale College, he adopted the profession of law, and removed to the western part of Massachusetts, where he was a member of the Colonial Assembly. Though a loyalist in feeling at the outbreak of the American revolution, he took the part of his country, and served as an aide-de-camp to General Thomas in the unfortunate expedition to Canada. In 1785, he settled at Stockbridge, Massachusetts, where his descendants now reside, became a member of the Continental Congress, and took an active part in suppressing Shay's rebellion. He remained in congress as representative or senator until 1799, and in 1802 was appointed judge of the Supreme Court of Massachusetts, and was a prominent member of the old Federalist party, and an early opponent of slavery. He died at Boston, January 24, 1813.—THEODORE S., American lawyer and writer, son of the preceding, was born at Sheffield, Massachusetts, December 1780. Like his father he was bred to the legal profession, and in 1801 settled at Albany, New York, where he remained in successful practice until 1821, when he retired to Stockbridge, advocating, as a popular speaker, the interests of a scientific agriculture, free trade, temperance, and anti-slavery, and wrote *Public and Private Economy, illustrated by observations made in Europe in 1836—1837* (3 vols., 12mo, New York, 1839). He died of a stroke of paralysis, after making a public speech at Pittsfield, Massachusetts, November 7, 1839.—SUSAN RIDLEY S., wife of the preceding, descended from an old English Border family, and proud of her relationship to Bishop Ridley, was a daughter of William Livingston, governor of New Jersey. She is the author of *The Fools of Pleasure* (1829); *The Young Emigrants*, and *The Children's Week* (1830); *Allan Prescott*, a novel (1834); *Alida* (1844); and *Walter Thornby*, novel, written in 1859, when she was more than 70 years old. She resides on the family estate at Stockbridge.—CATHERINE MARIA S., American authoress, daughter of Judge Theodore Sedgwick, as born at Stockbridge, near the close of the 18th century. In 1822, she published *A New England Tale*, which was followed, in 1824, by *Ridwood*, a novel, so popular that it was reprinted in England, and translated into several of the continental languages. This was followed by *Hope Leslie, or Early Days in America* (1827); *Clarence, a Tale of our own Times* (1830); *Le Bossu and The Linwoods* (1835); and these by a series of popular stories, illustrating morals and domestic economy, entitled *The Poor Rich Man and the Rich Poor Man, Live and Let Live, Means and Ends, Home, &c.*; and attributed a 'Life of Lucritia Maria Davidson,' to Mark's *American Biographies*. In 1841, on her return from Europe, she published *Letters from Abroad Kindred at Home*; in 1845, *Wilton Harvey and her Tales*; followed by *The Morals of Manners, and Married and Single*. She also edited, and was an active contributor to some of the leading American periodicals. Died July 31, 1867.—THEODORE S., an American lawyer, son of the second Theodore S., was born at Albany, January 27, 1811, was educated at Columbia College, and admitted to the bar in 1833; excepting three years spent at Paris, as secretary of the American legation, continued in successful legal practice until 1850, when he again visited and made an extensive tour in Europe. He steadily declined to engage in politics, and refused all offices tendered him, until, in 1856, he accepted that of United States attorney for the southern district of New York. Among his writings are, a standard treatise on the *Measure of Damages*; a work on *The*

Interpretation and Application of Statutory and Constitutional Law; the *Memoirs of William Livingston*, his grandfather; *The Life and Works of William Leggett*, and various occasional addresses. He died at Stockbridge, December 9, 1859.

SEDITION (Lat. *seditio*, from *se*, apart, and *ire*, to go), a general name given to such offences against the state as fall short of treason. In the law of England, it is not a strictly technical word. Writing, publishing, or uttering words tending to excite subjects to insurrection, though not urging them to rebellion or total subversion of the government, come under this denomination. There are various English statutes (as 39 Geo. III., c. 70; 57 Geo. III., c. 19; and 60 Geo. III. and 1 Geo. IV., c. 8) directed against particular acts of sedition, such as seditious libels, and seditious meetings or assemblies, which are punishable as misdemeanours. Act 36 Geo. III., directed against all seditious practices and attempts tending to high treason, is extended to Ireland by 11 Vict., and additional provisions are added to it. By this latter act, the compassing or devising, either to depose the Queen; to levy war against the Queen, for the purpose of changing her Majesty's measures, or constraining or overawing parliament; or to move any foreigner to invade the Queen's dominions, is made felony, punishable by transportation for life, or for a period not less than seven years, and that even though the facts should amount to treason.

In Scotland, sedition is distinguished from Leasing-making (q. v.), in so far as the object of the latter is to disparage the private character of the sovereign, while the former crime is directed against the order and tranquillity of the state. The punishment of sedition, formerly arbitrary, is now restricted to fine and imprisonment.

SEDUCTION, in point of law, is the taking of an unmarried woman's chastity without marriage, and under circumstances of fraud. It is not a criminal offence unless violence is used, and resistance overcome, or the age of the female is under 21, in which cases the offence is Rape (q. v.) or Abduction (q. v.). In England, where no force has been used, no action at law can be maintained by the female seduced, however deceitfully the man may have acted. But if the female is a servant, either to her father or mother or a third party, then the master or mistress can sue the seducer, provided any loss of service has been caused by the seduction, such as her absence when lying-in of a child. Though, strictly speaking, the damages recovered by the master or mistress, in such a case, should be measured solely by the pecuniary value of the services lost, yet it is an inveterate practice for juries to give damages greatly beyond that amount, especially where the father or mother sues, and the conduct of the man has been base and heartless. In Scotland, the woman can sue in her own right for damages if deceit has been used, but the difficulty of establishing that the deceit was the sole cause of the injury, prevents such actions from being common. The remedy there more frequently resolves itself into an action for breach of promise of marriage, or for declarator of marriage, or for filiation and aliment.

SEDUM, a genus of plants of the natural order *Crassulaceae*, having the calyx in 4—8 (usually 5) deep segments, which often resemble the leaves, the same number of spreading petals, twice as many stamens, and 4—8 (usually 5) germens, each with a nectariferous scale at the base. The species are numerous, with succulent, often roundish, leaves; and pretty, star-like flowers. Many of them grow on rocks, whence the English name **STONE-CROP**. They are natives of the temperate and

cold parts of the northern hemisphere; some are British. They have no important uses; some are refrigerant, others are acrid. Among the British species is *S. Telephium*, popularly called ORPINE, sometimes used as a diuretic; and *S. acre*, the most common, whose brilliant yellow flowers adorn the tops of old walls, the debris around quarries, &c.

SEE (Lat. *sedes*, a seat), in ecclesiastical use, properly signifies the seat or chair (*cathedra*), sometimes also called 'throne,' of a bishop. Popularly, however, and indeed by universal usage, it is employed to designate the city, and thence, at least in popular language, the entire diocese, in which the seat of the bishop is placed, and over which, consequently, his episcopal jurisdiction extends. Sees have always been fixed, at least in their primitive establishments, in some city or considerable town; and it is to be observed that the name of a see is always taken not from the district governed by the bishop, but from the city or town. Sees *In Partibus Infidelium* (q. v.) still retain their ancient names, although in very many cases not merely the cities themselves, but even all traces of the Christian religion, in the sites upon which they anciently stood, have disappeared. In the Roman Church, the pope alone establishes sees, and alters their distribution and their local limits and boundaries; but these changes are not made except in extreme cases (such as that of the French Revolution) without the consent of the actual bishop. In the Anglican Church, this is done by the authority of the legislature.

SEED, in Phanerogamous Plants, that part which may in some measure be regarded as corresponding to the perfectly developed impregnated ovum of animals, and which is the utmost effort made by the plant for the reproduction of its species. It is the perfectly developed Ovule (q. v.). Whilst one cell of the interior of the nucleus (see OVULE) greatly enlarges, the other cells are forced back; the interior of the nucleus thus becomes a cavity (the embryo sac), and Fecundation (q. v.) now taking place by means of the pollen, the primary cell is formed, which grows to form the embryo. As the fertilised ovule is developed into the ripe seed, the *foramen* (see OVULE) or *micropyle* closes completely; but its place is commonly marked in ripe seeds by a little cicatrix. In the ripe seed, the integuments of the ovule, more fully developed, form the covering (*spermoderm*); whilst the *nucleus* is either entirely converted into the Embryo (q. v.), or also into an unorganic cellular mass called the Albumen (q. v.), which is, in an economical point of view, the most important part of many seeds, as of those of the cereal grasses. The embryo, which with respect to the reproduction of the plant, is the most essential part of the seed, is developed to various degree in different plants—which is also the case in different animals, and even in those of the same class, as in mammalia; but in general, the *radicle* may be distinguished in it—the beginning of the root or descending axis of the new plant, and the *plumule* or *gemmule*—the beginning of the stem or ascending axis, as well as the *cotyledon* or cotyledons, provided for the nourishment of the new plant in its youngest stage. When the embryo is accompanied with albumen, it is sometimes completely enclosed in it; sometimes it lies at the side of the albumen; and sometimes it surrounds the albumen like a ring, or even completely. Sometimes, but rarely, the embryo is not well developed in ripe seeds, so that its parts cannot be distinguished, as in the *Orchidea*, in which it appears as a roundish or oval, uniform, little cellular mass. In germination, the embryo

breaks through the covering of the seed, and develops itself into the new plant.

Seeds are either *sessile* or *stalked*. The stalk is of various length, and is formed of the *funiculus* or *umbilical cord*; the place at the base of the seed by which it is affixed to the inside of the fruit, to the end of the *funiculus*, being called the *hilum* or *Hilum*. When the seed is perfectly ripe, it has no further need of connection with the parent plant, and the *funiculus* dries up, leaving the seed a mere scar.

Besides being enclosed in a capsule, or in a succulent fruit, &c., the most essential parts of the seed have coverings of their own, which are reckoned as belonging to the seed itself. Its general covering is called the *spermoderm* (Gr. *sperma*, seed, *derm*, covering), which consists of an external membrane, the *testa* (Gr. shell) or *episperm* (Gr. *epi*, upon), and an internal membrane, the *endopleura* (Gr. *endo*, within, *pleura*, side). Sometimes there is within the episperm a fleshy layer, called the *sarcotesta* (Gr. *sarz*, flesh). The Aril (q. v.) is a comparatively rare additional covering.

The seeds of phanerogamous plants afford characters which distinguish two great classes as *Monocotyledonous* and *Dicotyledonous* (see COTTLETON). Very few plants have more than two cotyledons (seed-lobes). It is the case, however, with some the *Coniferæ*. Cryptogamous plants are also designated *Acotyledonous*, as having no seed-lobes; the name *Spore* (q. v.) is distinctively given to these seeds.

Seeds retain their vitality very long; but at the same time seems to be very various with the seeds of different plants, and in different circumstances. The grains, or seeds of cereal grasses, are particularly excelled in this respect by none; grains of wheat found in the tombs of the Incas have been made to vegetate; and also, it is said, grains of wheat taken from Egyptian mummies, although of this there is some doubt. After the great fire of London, 1666, plants not previously common sprang abundantly on the waste ground; certain plants previously unknown there are sure to appear after a fire in the American forests; and instances of a constantly occurring of a deep trenching of land by a turning up of soil by railway or other operations producing a crop of some kind of plant previously unknown or rare in the locality. Thus the writer of this article has seen plants of the Milk Thistle appear on rubbish thrown out from the foundations of a house in Peeblesshire, where there was no Milk Thistle in the neighbourhood. And in Renfrewshire, willows spring up in the ditches which are cut for drainage, from the seeds of the soil which underlies the moss or peat. It is difficult to conjecture how long the seeds, in such cases, may have retained their vitality.

Exposed to the air, however, seeds generally lose their vitality in a few years. Some kinds retain much longer than others. Seeds which absorb fixed oil seem to lose it more quickly than others.

In conveying seeds from one part of the world to another, and through great diversities of climate, it is desirable to have them as closely secured to the air as possible. But it has been found that seeds brought from the Botanic Garden at Edinburgh to Scotland, round the Cape of Good Hope, and other care than would be used in sending a seed from a seed-shop to a neighbouring gardener, greater part readily vegetated.

SEELAND (Dan. *Sjælland*), the largest and most important island of Denmark, lies between the Kattegat and the Baltic, and is separated from Sweden, and by the Great Belt from Funen. Length, 78 miles; extreme breadth, 7½ miles.

SEER—SEIDLITZ POWDERS.

area, 2672 sq. m.; pop. in 1870 (including the two small islands Møen and Samsøe), 637,711. The surface is almost flat; the coasts, which are rock-bound on the south-east, are indented by bays and fiords, the chief of which is the Roeskilde-fjord in the north. The rivers are small, the largest being only 50 miles long; there are several lakes, and all the waters abound in fish. The island contains several beech-forests, is exceedingly fruitful in corn, and breeds excellent horses and cattle. Agriculture and cattle-breeding are the principal employments of the inhabitants. The chief place is Copenhagen (q. v.), the capital of the country, on the east coast, and from this city, lines of railway traverse the island to Elsinore in the north, and to Korsør in the south-west, on the coast.

SEER. See PROPHECY.

SEGGAR, a vessel used by potters to protect delicate articles from the too fierce action of the fire in the kiln. See POTTERY.

SEGMENT (Lat. *segmentum*, a part cut off) is, in Geometry, a portion cut off from a circle by a line, or from a sphere by a plane. When the angle subtended at the centre of a circle by the segment, and the radius, or when the chord of the segment and its height, are known, the length of the arc of the segment and its area can be determined with as much accuracy as the circumference and area of the whole circle. See SPHERE.

SEGNO (Ital. sign), a word used in musical notation in connection with marks of repetition. When a part is to be repeated, not from the beginning, but from some other point, the mark ♩ is placed over the point where the repetition is to commence, and the words *Dal Segno* (or *d. s.*) are written at the close of the part to be repeated.

SEGO, an important town of Western Africa, capital of the state of Bambarra, stands on the Niger, here called the Joliba, in lat. 13° 5' N., long. 7° W. Its streets, which are winding, have a breadth of from 24 to 26 feet, and are extremely clean. The palace of the king is large enough to accommodate 2000 men and 500 horses. The houses are built of clay, and are flat-roofed, and the royal residence differs from the other dwellings only in size. The country in the vicinity is well cultivated, and the town is the seat of considerable traffic. Mungo Park, from whom we derive almost all the knowledge we possess of S., here first beheld the Joliba. Pop. estimated at 30,000.

SEGO'RBÉ, a small town of Spain, in the modern province of Castellon, on the right bank of the Palancia, in a valley renowned for the beauty of its scenery and for its amazing fertility, 20 miles north-west of Murviedro. It stands on a hill between two castles, and contains stately houses, numerous churches, and a cathedral. Brandy-distilling is carried on to a great extent, and there are flour and paper mills. Pop. 6200.

SEGOVIA, an interesting city of Spain, capital of the modern province of the same name (see CASTILE), stands on the Eresma, by which it is nearly encircled, 47 miles north-north-west of Madrid. It occupies the top of a rocky knoll, 3300 feet above sea-level, is surrounded by picturesque walls with round towers, and consists of narrow uneven streets, with old, quaint, and stately houses, 24 parish churches, and 21 convents. The Alcazar, or castle, is perched on the west extremity of the rocky height, and was originally Moorish, but repaired magnificently in 1452–1458. The cathedral of S., a noble specimen of florid Gothic, is one of the finest in Spain. The present building was begun in 1525. The square cupola-crowned tower is 330 feet

high, and the prospect from this elevation is superb. The grand aqueduct of S., supposed to have been built in the time of Trajan, is believed to be the most important Roman structure in Spain. It consists of two rows of arches, the one resting upon the other, from 2500 to 3000 feet in length, and 102 feet high. There is a mint here for coining copper money. Wool-scouring and the manufacture of woollen fabrics are languidly carried on. Pop. 13,100.

S. was a place of importance during the time of the Romans; was the seat of immense cloth-manufactures in the time of the Moors, and was frequently the residence of the kings of Castile and Leon. Charles I. of England lodged at the Alcazar, September 13, 1623, and supped on 'certain trout of extraordinary greatness.' The unresisting town was entered in 1808 by the French, under Frere, and completely sacked.

SEGUR, the name of a French family, distinguished both in arms and letters. It is of Limousin origin, and was known there, it is said, as far back as the 9th century. The first, however, that specially merits notice was HENRI FRANÇOIS, Comte de S. (born 1689, died 1751), an able French general in the war of the Austrian Succession. His son, PHILIPPE HENRI, Marquis de S. (born 1724, died 1801), fought in the Seven Years' War, obtained the dignity of *Maréchal de France* in 1783, and outlived in his retirement the stormy scenes of the Revolution. The eldest son of this Philippe Henri was LOUIS PHILIPPE, Comte de S. (born 1753, died 1830), a vivid dashing sort of man, for some years ambassador at the court of St Petersburg, and a great favourite with Catharine II. Of impressionable fancy, full of enthusiasm for the 'philosophers,' the 'reign of reason,' and the 'new ideas' generally, he hailed the great Revolution with delight, but took no prominent part in it. His public career during the Empire was respectable, but not brilliant; but one notice with satisfaction that he retained in extreme old age that love of liberty that marked his early years; the last act of his life being an eulogium on the revolution of July. As a writer, S. has in wonderful perfection the national graces of style and spirit. Among his numerous writings are: *Pensées Politiques* (Par. 1795), *Histoire de Frédéric Guillaume II.* (Par. 1800), *Contes, Fables, Chansons et Vers* (Par. 1801), and *Mémoires ou Souvenirs et Anecdotes* (Par. 1824). He left two sons, OCTAVE and PAUL PHILIPPE, the latter of whom (who was born in 1780) was a general of the First Empire, took part in the fatal expedition to Russia in 1812, and wrote the story of the campaign, *Histoire de Napoléon et de la Grande Armée pendant l'année 1812* (Par. 2 vols., 1824). The work has had an immense success, and has been translated into almost all the languages of Europe. Other works of the Comte Paul Philippe de S. are: *Lettre sur la Campagne du Général Macdonald dans les Grisons* (Par. 1802), *Histoire de Russie et de Pierre le Grand* (Par. 1829), *Histoire de Charles VIII., Roi de France* (Par. 1834); &c.

SEGU'RA, a river in the south-east of Spain, rises in the Sierra Seca, and after an east-south-east course of about 180 miles, enters the Mediterranean 27 miles below Orihuela. Ships unload at its mouth.

SEIDLITZ POWDERS are composed of 120 grains of tartrate of soda and potash, and 40 grains of bicarbonate of soda reduced to powder, mixed and enclosed in a blue paper, and 35 grains of powdered tartaric acid in a white paper. The contents of the blue paper are dissolved in from half a tumbler to a

in relation to Luther. S.'s works were collected and published at London in three folio volumes, 1726.

SEL D'OR, a salt employed in Photography, originally to aid in fixing and improving the image on a Daguerreotype-plate, and more recently for toning positive paper-proofs. It is a double hyposulphite of gold and sodium, the constitution of which is expressed by the formula $\text{AuO}_2\text{S}_2\text{O}_3 + 3\text{NaO}_2\text{S}_2\text{O}_3 + 4\text{H}_2\text{O}$. It is formed when 1 part of chloride of gold in solution is added to 3 parts of hyposulphite of soda, also in solution. The hyposulphite of soda should be always in excess during the mixture, a condition which is secured by adding the chloride of gold to the hyposulphite of soda, and not *vice versa*. The salt so formed is precipitated in fine, white, crystalline needles on the addition of alcohol to the above mixed solutions; these are collected on bibulous paper, and gently dried for use. Adulterations in the commercial article, which are unfortunately only too common, may be ascertained by precipitating, igniting, and weighing the gold contained in the sample it is desired to test. Nitric acid free from chlorine will decompose this salt, and precipitate its contained gold in the metallic form.

SELENÉ, the Greek name of the goddess of the moon; called also *Mene*, and in Latin, *Luna*. Her myth is differently told, but the most common account makes her a daughter of Hyperion and Theia, and sister of Helios (the Sun) and Eos (the Dawn); as sister of Helios, also called *Phoibos* (the Shining One), she had the name of *Phæbe*, and latterly was identified with Artemis (see DIANA), though the identification was never quite exact, as Artemis always retained her reputation for chastity, while S. had 50 daughters by her lover Endymion, and several by Zeus, one of whom was called *Ereë* ('the Dew'), indicating the original physical character of the myth. In Art, the two are always distinct. S. is represented by the poets with long wings and a golden diadem, riding across the heavens in a chariot drawn by two white horses, cows, or mules.

SELENITE (Gr. *Selēz*, the moon), a transparent and beautiful variety of Gypsum (q. v.), white, or tinged with green, gray, or yellow. It receives its name from its peculiar moon-like lustre. It is often crystallised in six-sided prisms, sometimes in lenses, and twin crystals and quadruple crystals occur. It is found in common gypsum, in rock-salt, in the Blue Clay of the south of England, &c. There is in the British Museum a splendid group of crystals of S., presented by the late Prince Albert. S. is easily cut, and is capable of being split into extremely thin plates, which are flexible, although not elastic. It was used by the ancients for some of the purposes for which we use glass. The Romans imported it from Spain, Cyprus, Cappadocia, and Africa. The hothouses of Tiberius were covered with it, and Pliny mentions that it was used in the construction of beehives by those who wished to watch the operations of the bees. It is used for making the finest kind of stucco, and the most delicate pastel colours. When burned, and perfectly dry, its powder is used for cleansing and polishing articles of gold and silver, precious stones, and pearls.

SELENIUM (symb. Se, equiv. 39.3, and sp. gr. 4.28) is one of the metalloids or non-metallic elements. At ordinary temperatures, it occurs as a solid of a dark-brown colour, and when broken, presents a conchoidal vitreous fracture; thin splinters of it are, however, of a dark-red tint when seen by transmitted light. It is tasteless and inodorous, a non-conductor of electricity; and like sulphur, to which it presents a remarkable analogy, it may be obtained in all three forms of atomic

aggregation, being solid up to 392°, when it fuses into a fluid, which boils at 650°, emitting an inodorous vapour of a deep yellow tint. When heated in the air, S. does not very readily take fire, but is combustible, and burns with a blue flame, while a portion of it is volatilised in red fumes, which emit an odour resembling that of bisulphide of carbon or garlic. The products of combustion are oxide of selenium acid, the peculiar odour being probably due to the former.

S. is of rare occurrence in nature; it is chiefly found as a selenide in combination with lead, silver, copper, or iron; but it has also been discovered in the sulphur from the Lipari Isles, and in certain sulphides of iron, which accounts for its detection in sulphuric acid. It is unnecessary to enter into any description of the mode of isolating it; nor need we do more than simply mention that it forms three compounds with oxygen— SeO , oxide of S.; SeO_2 , selenious acid; and SeO_3 , selenic acid; while with hydrogen it forms HSe , seleniuretted hydrogen, or hydroselenic acid, a colourless gas, which resembles, but is more offensive than sulphuretted hydrogen. Berzelius found that by the application of the nose to a bubble not larger than a pea, he was deprived of the sense of smell for several hours. It is prepared in the same way as the corresponding sulphur gas. As it is soluble in water, it should be collected over mercury.

S. was discovered in 1817 by Berzelius, who named it from *Selēz*, the Gr. for 'the moon,' because it was associated with tellurium, which was named from *Tellus*, the Lat. for 'the earth.'

SELEUCIA, the name of seven ancient cities in Asia, situated in Syria, Pisidia, Pamphylia, Caria, and Mesopotamia, and founded during the earlier existence of the dynasty of the Seleucids (q. v.). The most distinguished of these were SELEUCIA PIERIA, founded by Seleucus Nicator on the sea-shore, about 4 miles north of the mouth of the Orontes, and strongly fortified. It was the seaport of Antioch, and became of great importance during the wars between the Seleucids and the Ptolemies for the possession of Syria. It rapidly declined under the Roman dominion. The ruins have been fully explored and described in modern times by Pococke (*Observations on Syria*) and Chesney (*Royal Geographical Society's Journal*, vol. viii.). It was once a magnificent port in such an extremely good state of preservation as to require few repairs to render it serviceable; and the remarkable tunnel, 1088 yards in length, which was excavated out of the solid rock, and formed the only communication between the city and the sea; and the remains of its triple line of walls, of its citadel, temples, amphitheatre, necropolis, &c., all attest the former importance and splendour of the city.—2. SELEUCIA ON THE TIGRIS, was also built by Seleucus Nicator, on the west bank of the Tigris, 40 miles (according to Strabo) north-east of Babylon, which was despoiled to supply materials for the construction of the new city. Situated in a district of great fertility, commanding the great trading routes of Assyria, Babylonia, and Western Persia, it rapidly rose to great wealth and splendour, supplanted Babylon as the capital of the eastern portion of the Seleucid monarchy, and was in the acme of its greatness, contained a population of more than 600,000. Even in Strabo's time, it was larger than Antioch in Syria, the greatest commercial emporium of Asia; and down to the period of its final destruction, the number of its inhabitants is said to have never fallen below half a million. During the decline of the Seleucid monarchy, it became independent, and formed, from its wealth and splendour, an irresistible bait to the robber-kings

SELEUCIDÆ.

of Southern Armenia and Media, who partially plundered it on more than one occasion. But its position on the confines of Persia, which gave it its greatness, was also the cause of its destruction; for when the Seleucide monarchy was swallowed up by the Romans, and the long and desolating struggle between the latter and Persia had commenced, S., placed between two fires, was speedily brought to ruin. It was burned by Trajan (116 A.D.), and a few years afterwards, by Lucius Verus; and when visited by Septimius Severus was as desolate as the mighty city it had supplanted. The Emperor Julian, on his expedition to the East, found the whole country round it converted into a vast marsh, the haunt of innumerable beasts of chase and wild-fowl, and the city itself completely deserted.

SELEUCIDÆ, the dynasty of kings to whom fell that portion of Alexander the Great's immense and ill-compacted monarchy which included Syria, a large portion of Asia Minor, and the whole of the eastern provinces.

SELEUCUS I., surnamed Nicator, the first of this line, was the son of Antiochus, a distinguished officer in the service of Philip of Macedon, and was born about 358 B.C. He was one of the conspirators against Perdiccas, and in the second partition of the provinces of Alexander the Great's kingdom, obtained Babylonia, to which, with the aid of Antigonus, he subsequently added Susiana; but a misunderstanding with that powerful chief having arisen, Seleucus took refuge in Egypt (316 B.C.). The victory gained by Ptolemy over Antigonus's son, Demetrius, at Gaza having laid open the route to the East, Seleucus returned to his satrapy, amidst the joyous congratulations of his subjects (312 B.C.). From October 1 of this year (the date of Seleucus's return to Babylon), commences the *era of the Seleucidæ*. Having next recovered Susiana, he conquered Media, and extended his power to the Oxus and Indus. Of his campaign against Sandrocottus (q. v.), there are few details extant. In 306 B.C., he assumed the regal title; and four years afterwards, joined the confederacy of Ptolemy, Lysimachus, and Cassander, against the now formidable Antigonus, deciding the battle of Ipsus (301 B.C.) chiefly by his cavalry and elephants. Being now, after Antigonus's death, the most powerful of Alexander's successors, he obtained the largest share in the conquered kingdom, a great part of Asia Minor and the whole of Syria falling to him. Towards the close of his reign, war broke out with Demetrius (now his father-in-law), and afterwards with Lysimachus, king of Thrace and the other part of Asia Minor, both contests terminating in the defeat and death of his opponents, and being followed by the acquisition of the rest of Asia Minor. He was assassinated (280 B.C.) by Ptolemy Ceraunus. Of Seleucus's personal character, little can be gathered from the fragments of his history which remain to us; according to Pausanias, he was the most upright of Alexander's successors, unstained by those crimes which have foully blotted the characters of the others; but of his consummate generalship and great political talents, we have sufficient proof. He pursued with great zeal the plan of 'Hellenizing' the East, by founding numerous Greek and Macedonian colonies in various parts of his dominions; he also built numerous cities, several of which—as Antioch in Syria, and Seleucia on the Tigris—rose to be among the most populous and wealthy in the world.—After the reigns of ANTIOCHUS I. (q. v.) and ANTIOCHUS II. (q. v.), SELEUCUS II. (246–226), surnamed CALLINICUS, obtained the throne; but having, at the instigation of his mother Laodice, murdered his stepmother Berenice, an Egyptian princess, he was driven from his kingdom

by Ptolemy Euergetes (q. v.). However, he recovered his throne on Ptolemy's withdrawal; and though defeated in a great battle with the Egyptians, he succeeded in maintaining his hold of Syria and most of Asia Minor against both the Egyptians, and his younger brother Antiochus, who exercised independent authority over part of Asia Minor. Antiochus was at a later period wholly defeated in Mesopotamia, and soon after murdered by robbers. Seleucus undertook a great expedition against the revolted provinces of Parthia and Bactria, but was totally routed by Arsaces I., king of Parthia; while, on the north-west, several provinces were wrested from him by Attalus, the king of Pergamus.—His sons, SELEUCUS III. (226–223), surnamed CERAUNUS, and ANTIOCHUS III. (q. v.), 'the Great,' were his successors, the latter being the first of the dynasty who came into collision with the Romans.—SELEUCUS IV. (187–175), surnamed PHILOPATOR, was eager to dispossess the king of Pergamus of the provinces which he had taken from the Syrian monarchy, but fear of the Romans prevented him from carrying out his design.—ANTIOCHUS IV. (q. v.), EPIPHANES (I.) ('the Illustrious'), conquered Coele-Syria and Palestine from the Egyptians, to whom they had been given by his father; but retired from Egypt at the bidding of the Romans. He practised the most atrocious cruelties on the Jews, whose religion he endeavoured to root out, and introduce the Greek religion; but the heroic resistance of the Maccabees (q. v.) completely foiled his project. He died in a state of raving madness, which was attributed to his sacrilegious crimes by his subjects, who, in derision, converted his surname into EPIPHANES ('the Madman').—The succeeding names of the dynasty were: ANTIOCHUS V., EUPATOR (164–162); DEMETRIUS I., SOTER (162–150), who regained Babylon, lost Judea, and was defeated and slain by the impostor Alexander Balas (150–146); DEMETRIUS II., Nicator (146–138, 128–125), who overthrew the impostor, and was himself taken prisoner by the Parthians, Syria having been already seized by DIODOTUS, surnamed TRYPHON, who set up the puppet ANTIOCHUS VI., THEOS (144–142), and afterwards ascended the throne himself (142–137); ANTIOCHUS VII., SIDETES (137–128), who restored the royal line of the Seleucidæ; ANTIOCHUS VIII., GRYPUS (125–96), who was compelled to share his dominions with his half-brother ANTIOCHUS IX., CYZICENUS (111–95); SELEUCUS V. or VI., EPIPHANES (96–94), and ANTIOCHUS X., EUSEBES (95–83), who continued the division till 94 B.C., when the latter was victorious in a pitched battle, and seized the whole kingdom; for which, however, he was forced to fight with Philip, and ANTIOCHUS XI., EPIPHANES (II.), the younger brother of Seleucus; and DEMETRIUS III., EUCÆRUS (94–88), a third brother of Seleucus, who, with Philip, next claimed the sovereignty, which was taken from them by Tigranes (83–69), king of Armenia, at the solicitation of the Syrians; ANTIOCHUS XII., DIONYSUS, a fourth brother of Seleucus, and ANTIOCHUS XIII. (69–65), ASIATICUS. The short-lived prosperity of this dynasty, for it had begun to decline during the reign of SELEUCUS II., 80 years after its foundation, is principally owing to the fatal principle on which it was founded—viz., that of establishing a Græco-Macedonian power in a foreign country, instead of conciliating the attachment of the native populations, and governing them more in accordance with the Eastern method; the consequences were the successive revolts of the natives, the foundation of the independent and hostile kingdoms of Bactria, Parthia, Armenia, Judea, and the ultimate conversion of the small remnant into a Roman province by Cn. Pompeius, *q. v.*

SELF-DENYING ORDINANCE, a measure carried through parliament in 1645 by the influence of Cromwell and the Independents, with the view of removing Essex and the Presbyterians from the command of the army. It was moved by a fanatic of the name of Zouch Tate, who, on the ground that 'there is but one way of ending so many evils, which is, that every one of us freely renounce himself,' proposed, that 'no member of either House shall, during this war, enjoy or execute any office or command, civil or military, and that an ordinance be brought in accordingly.' The ordinance, which was clearly intended to take the executive power out of the hands of the more moderate politicians, and form an army independent of parliament, was the subject of violent and protracted debate, but eventually passed in both Houses, and became law. The consequence was that Essex, Warwick, Manchester, and others gave in their resignation, and the conduct of the war was intrusted to Fairfax; Cromwell, to whom, as a member of the Lower House, the self-denying ordinance extended, as much as to Essex and the rest, had the duration of his commission prolonged by the Commons on account of his invaluable services as a leader of cavalry, and by his brilliant achievements soon surpassed his commander in reputation.

SELIM I., Sultan of Turkey, son of Bajazet II., was born in 1467, dethroned his father by the aid of the Janizaries, 25th April 1512, and ascended the throne. To secure himself in his elevation, he caused his father, brothers, and nephews to be put to death, thus beginning a policy which he pursued inflexibly through the whole of his subsequent career, viz., to destroy without scruple every actual or possible obstacle to the accomplishment of his own ends. Urged on by a devouring appetite for conquest, and by the warlike fanaticism of the Janizaries, he declared war (1514) against Shah Ismail of Persia, and marched eastwards with an army of 250,000 men, massacring on the way 40,000 Shiites. He encountered Ismail at Calderoon, and defeated him with immense loss; but a spirit of disaffection breaking out in his army, he was compelled to content himself with this success, which gave him possession of Diarbekir and Kurdistan. In the following year, he overran Armenia; and leaving his lieutenants to complete this conquest, he marched against the Mameluke Sultan of Egypt, whom he had previously endeavoured to detach from intimate alliance with the Persian monarch. Kanst-ghori, the Egyptian sultan, was totally defeated (1516) at Marjabik by S., and Syria became the prize of the victor; and Kansu's successor, Touman-Bey, was still more unfortunate, his army being almost extirpated (1517) at the battles of Gaza and Rudania. The victorious Turks then entered Cairo without opposition; Touman-Bey and his chief supporters were put to death, and Egypt incorporated with the Ottoman empire. The last lineal descendant of the Abbaside calif, who was then resident in Egypt, transmitted to S. the religious prestige which had devolved upon himself by descent, and at the same time bestowed upon him the title of 'Imaum,' and the standard of the Prophet. In consequence of this gift, the Ottoman sultan became the chief of Islam, as the representative of Mohammed; and the sacred cities of Mecca and Medina, along with the chief Arabian tribes, in consequence acknowledged his supremacy. Thus, in less than four years, S. did more to extend the Ottoman empire than any of his most renowned predecessors during a whole reign. He also laid the foundation of a regular marine, constructed the arsenal of Pera, chastised the insolence of the Janizaries with savage severity, and laboured

to ameliorate, by improved institutions, the condition of the various peoples he had conquered. He died 22d September 1520, while planning fresh campaigns against both Persians and Christians. This prince, who in a sense merited his title of *Yavuz* (the Ferocious), was nevertheless a lover and encourager of literature, and even himself cultivated the poetic art. S. was succeeded by his son Solyman the Magnificent (q. v.).

SELIM III., Sultan of Turkey, the only son of Mustapha III., was born 14th December 1761, and ascended the throne on the death of his uncle, Abdul Hamid, in 1789. Seeing clearly the causes of the decadence of the empire, and the proper remedies, he inaugurated a policy of renovation and progression; but the war with Russia, in which he raised an army of 150,000 men was totally defeated, first by the Prince of Coburg, and next by Suwarof, put a stop for a time to his schemes of reform. He was compelled, in 1791, to cede Choczim to Austria, and in the following year, all his possessions beyond the Dniester to Russia. About this time, his domestic harmony with Napoleon was troubled by the expedition of the French to Egypt, and subsequently by the question of the recognition of the French Empire, but on the whole, S. continued the friendly alliance of France; and at every opportunity pursued with ardour his various reforms, establishing cannon-foundries, and organising a body of troops ('the Nizam-Djedit'), armed, clothed, and disciplined in the European fashion; but this reform stirred up against him (1805) all the fanatic bigotry of his subjects. The priests of Islam preached revolt in different parts of the empire, and accused their sovereign of despising the holy traditions of the Koran, so that S. felt compelled to adopt a more cautious policy. At length a formidable rebellion broke out, and the Nizam-Djedit, who attempted to suppress it, were disempowered, their commander put to death, and the rebels marched into Constantinople, their ranks being swelled at every step by bodies of dissatisfied Janizaries. All those who had favoured or rewarded the sultan's schemes were seized and put to death, and S. was compelled to issue a decree suppressing the new institutions. But the malignant enmity of the mufti and his coadjutors was thus to be satisfied, and S. saw himself forced to resign the throne (1807) to his cousin, Mustapha IV. (1807—1808).

On the news of this insurrection being conveyed to Mustapha-Bairaktar, the Pasha of Rostchuk, one of the sultan's chief advisers, this energetic soldier marched upon Constantinople, with a view to reinstate S. on the throne, but on the arrival the unfortunate monarch was strangled, his body cast at the feet of Bairaktar. **BAIRAKTAR**. Thus perished S., and with it the first attempt at reformation in Turkey, the effects of which, however, were not wholly lost. Manufactures had begun to flourish, thousands of silk and other looms were now in vigorous operation, a printing press had been established in Scutari, and many other improvements calculated to favour the prosperity and happiness of his subjects had been inaugurated; though these advantages, the natural result of S.'s enlightened patriotism, were neither understood nor appreciated by the great majority of his ignorant and fanatical subjects.

SELIMNO, a walled, manufacturing town of European Turkey, in Rumili, at the southern base of the Balkan Mountains, 78 miles north of Adrianople. Owing to its far inland position, there is little communication between the town and the coast, and consequently the annual fair held here is

SELJUKS—SELKIRK.

of very great importance. Arms, cloth, and attar of roses are manufactured. Pop. 15,000.

SELJUKS, or **SELJUK-TURKS**, were an offshoot of the Hoi-He or Hoi-Hu, a collection of tribes of Turkish race, who, being driven south-westward from the Chinese wall, had, in 744 A.D., overwhelmed that Turkish empire of Kiptchak which had given so much annoyance to the Sassanides (q.v.) during their reign in Persia. The Hoi-Hu rapidly extended their power from the Caspian Sea as far as the Hoang-ho, and at the time when the S. separated themselves from them, were ruled by a chief named Bigd Khan. Seljuk, from whom the S. derived their name, was the chief of a small tribe which had gained possession of Bokhara and the surrounding country. His sons, attracted by the beauty and fertility of Khorassan, began, about 1027, to migrate to that country, and after some struggles with the Ghiznvide sultans, established themselves in Northern Khorassan, with Togrul Beg, the eldest grandson of Seljuk, as their chief, and Nishapur as their capital. Togrul, leaving his brother in Khorassan, set out on his conquering march, subdued Balkh and Khwarezm in 1041, Irak-Ajemi in 1043, subsequently adding to these Kerman and Fars. He then advanced to Bagdad, which he took in 1055, dethroning the last vizier of the Dilemite (see SAMANI) dynasty, and being invested by the reigning calif with the vacant office; after which he completed his conquest of Persia by the reduction of Irak-Arabi and Mosul about 1061. The S. were zealous Mohammedans, and Togrul Beg seems to have been a vigorous promoter of the faith which he professed, for he built numerous mosques, subsidised pious and learned men, and treated the alif—his spiritual chief—with profound respect. After his death in 1063, his nephew, ALP-ARSLAN (q.v.), succeeded to supreme power, and became one of the most renowned monarchs of Asia. His son, **MELEK SHAH** (1073—1093), the most powerful monarch of this dynasty, added, by means of his generals, Arabia, Asia Minor, Armenia, Syria and Palestine, and Transoxiana to his empire, which now extended from the Hellespont to the borders of Chinese Tartary; and even the ruler of Cashgar acknowledged his authority. This empire, though extensive and ill-compacted, was preserved in the highest order and prosperity by his able minister, the virtuous Nizam-ul-Mulk, under whose firm, just, and wise government the rights of all classes were maintained, religion promoted, and learning encouraged, till the Persians who had reviled the conquest of their country by the Turks at the worst of evils, were forced to confess that it had proved the greatest of blessings. In 1092, Melek Shah, lending an ear to the misrepresentations of Nizam-ul-Mulk's enemies, deprived him of his office; and the aged minister was soon afterwards assassinated by one of the followers of Masun Subah, the chief of the Assassins (q.v.), and the mortal enemy of the good ex-vizier. Hospitals, caravanserais, bridges, roads, and canals test the zeal with which the commercial interests of the empire were furthered; while the colleges of Isfahan, Ispahan, and Herat, the law-college of Bagdad, and the observatory (the first in Asia) of the same city, indicate the care bestowed on the promotion of literature and science. Melek Shah, under whom the empire of the S. had attained the height of its power and splendour, laid a sure foundation for its rapid decline, by subdividing it into a number of separate principalities, all professedly subject to the central state of Iran or Bagdad. The chief of these principalities were: 1. The central state of the S. of Iran, whose ruler was the vizier, the calif, and exercised direct authority over

Northern and Western Persia to the borders of the Arabian desert. The chief monarchs of this branch were Mohammed Shah, whose generals warred with the Crusaders in Palestine, and Sultan Sanjar, one of the most celebrated of the S. princes, great both in success and misfortune. This branch was annihilated in 1194 by the Shah of Khwarezm. 2. *The S. of Kerman*, who were annihilated in 1191 by the Ghuz Turkomans. 3. *The S. of Iconium*, who ruled over Asia Minor, and whose founder was Soliman, a great-grandson of Seljuk. This branch endured for 224 years—from 1075 to 1299—and during that period was engaged in numerous wars with the Byzantines and with the Crusaders, both of whom learned to dread its power. During its last years, it was tributary to the Mongols; and in 1299, the present Turkish empire rose on the ruins of its power (see OTHMAN). 4. *The S. of Aleppo*, who ruled from 1079 till their extinction in 1114. 5. *The S. of Mosul*, who were speedily supplanted by *attabegs*, or independent governors, of whom Zenghi, and his renowned son, Nouredin (q.v.), were the most celebrated. 6. *The S. of Damascus*, an offshoot (1096) from the Aleppo principality, which lasted till 1155, when it was put an end to by Nouredin. 7. *The S. of Mardein*, who only appear in common history as the allies of the S. of Iconium, Mosul, Aleppo, and Damascus, against the mighty crusading armies of Western Europe. And 8. *The S. of Khwarezm (Khiva)*, who founded a great empire, including the whole of the country within the Jaxartes, the Bolor Mountains, the Indus, the Sea of Oman, and the Persian Gulf; but the last monarch, Allah-ed-din Mohammed Shah, having wantonly put to death some Mongol merchants who were pursuing their avocations within his dominions, was doomed to destruction by the terrible Genghis Khan (q.v.), who crossed the Sir-Daria, conquered Transoxiana, defeated Mohammed's armies, and drove the Shah himself to take refuge in an island of the Caspian, where he died. The advance of the Mongols was gallantly opposed by Mohammed's celebrated son, Jelal-ed-din, who twice defeated them; but being totally routed (1221), on the west bank of the Indus, by Genghis himself, he plunged his horse into the Indus, and safely reached the opposite bank, none of his enemies daring to follow him. The whole of this extensive empire now fell under Mongol domination.

SELKIRK, ALEXANDER. See JUAN FERNANDEZ.

SELKIRK, a Scottish royal burgh, capital of the county of the same name, on an eminence overlooking Ettrick Water and the famous field of Philiphaugh, where General David Leslie defeated Montrose and crushed the cause of King Charles in Scotland, 40 miles by the North British Railway south-south-east of Edinburgh. The county buildings (opened 1870), the old town-hall, with a spire 110 feet high, and the monuments to Sir Walter Scott and to Mungo Park, are the principal architectural features. S. has large woollen mills. Tweeds, hosiery, and blankets are the chief articles of manufacture. Pop. (1871) 4640. S. joins with Hawick and Galashiels in sending one member to parliament. S. commands a splendid view across the valley or haugh in which the Ettrick and Yarrow meet. It is within a few miles of many of the most famous localities in Scotland, and is a favourite starting-point for tourists desirous of exploring the 'Scott' country, the 'Forest,' the Yarrow, and St Mary's Loch. Upwards of a hundred fighting men went from S. to join King James in his fatal march to Flodden; of these, only four returned, but they proudly bore a standard taken from the enemy on that occasion. The manufacture of 'single-soled

shoon' long flourished here, and the 'Souters of Selkirk' are commemorated in song and story.

SELKIRKSHIRE, in ancient times called Ettrick Forest, is bounded by the counties of Midlothian, Roxburgh, Dumfries, and Peebles, on the N., E., S., and W. respectively. It extends in length from north to south about 28 miles, and from east to west 16 to 18 miles, and consists mainly of the two parallel valleys through which flow the rivers Ettrick and Yarrow. Its area is 260 sq. m., or 166,524 acres. S. contains three entire parishes, and parts of other seven. It is in a great measure a pastoral county, and some of the hills are of considerable altitude, being upwards of 2000 feet in height. The hills are rounded at the top instead of peaked, and are covered generally with grass, affording excellent pasturage, but in some places with heather. The arable land, situated from nearly 300 to 800 feet above sea-level, and bearing the proportion of about one-eighth of the area, is, in general, of a light soil, and produces the ordinary crops in abundance. Besides the Ettrick and Yarrow, the Tweed, Gala, and Caddon flow through parts of the county. The banks of several of these are beautifully wooded; but the extensive woods from which the county originally took its name of the Forest, have disappeared. According to the agricultural returns for 1873, the number of occupants of land was 240; the acreage under permanent pasturage (exclusive of heath and mountain land) was 6786; that of corn crops was 5093, including 110 acres of wheat, 787 acres of barley, and 4185 acres of oats; that of green crops was 3263, embracing 2779 acres of turnips and 212 acres of potatoes. The acreage under hay and grass, not included under permanent pasturage, was 7254. The average of produce is above that of most of the other counties. Of horses, there were 558; of cattle, 2604; of sheep, 172,384; of swine, 420—total stock, 175,966. The old valued rent was £6692. The new valuation, including the burgh, is more than £70,000. This county contains some historical scenes, among which is the field of Philiphaugh, where the Marquis of Montrose was defeated by the Covenanters under General Leslie. Oakwood Castle, in ruins, was the residence of the famous wizard, Michael Scott; and Newark, also in ruins, was the residence of Anne, Duchess of Buccleuch, where the *Lay of the Last Minstrel* is represented by Scott as having been sung. S. is pretty well appointed for roads. The Hawick line of the North British Railway runs for a short distance along its border, from which, at Galashiels, there is a branch to Selkirk; and the North British line from Edinburgh to Peebles passes through its northern end from Innerleithen to Galashiels, a distance of about 12 miles. There are several places of worship, belonging to the Establishment, the Free Church, and various other dissenting bodies. There is no coal, or lime, or sandstone. The Douglas family, four centuries ago, were the principal proprietors. The Duke of Buccleuch now holds about two-thirds of it. The population in 1871 was 14,005, the inhabited houses 1741. S. and Peeblesshire conjoined return one member to parliament.

SELTERS WATER (commonly but incorrectly written *Seltzer Water*), takes its name from the village of Lower Selters near Limburg, in the duchy of Nassau, where several springs united, in one basin, yield 5000 cubic feet an hour of this sparkling and effervescing mineral water. Its chief ingredients are carbonic acid, carbonate of soda, and common salt. It acts as a mild stimulant of the mucous membranes and as a diuretic; and is applied in chronic disorders of the digestive, respiratory, and

urinary organs. It is much recommended as a beverage, either alone or with sugar, to those suffering from liver complaint, and in hot climates and seasons. More than 1½ millions of jars or bottles of this famous water are exported yearly to all quarters of the world, affording to the state a revenue of above £6000. The spring was discovered early in the 16th c., but was at first so little prized, that in the middle of the 18th c. it was rented for 4s. The water is little drunk at the spring. Artificial Selters Water is extensively manufactured both on a large scale and for domestic use. See **ALBANY WATERS**.

SEMAPHORE (from *sema*, a sign, and *phor*, to bear) was the name applied to the system of telegraphy in use before the application of the electric current. Semaphores were first established by the French in 1794, as a plan for conveying intelligence from the capital to the armies on the frontier. In the following year, Lord George Murray introduced them in England; and by their means the British Admiralty were placed within a few minutes of Deal, Portsmouth, or Plymouth. These semaphores consisted of towers built at intervals of from 5 to 10 miles, on commanding sites. On the top of each tower was the telegraph apparatus, which at the

Semaphore.

comprised 6 shutters arranged in 2 frames by the opening and shutting of which, in various combinations, 63 distinct signals could be formed. In 1838 Sir Home Popham substituted a mast with 2 arms similar to many of the present railway signals. The arms were worked from within the tower by winches in the look-out room, where a powerful telescope in either direction constantly commanded the mast of the next station. If a fog set in at a point on the route, the message was delayed; otherwise, when a sharp look-out was kept, the transmission was very rapid. For instance, the ball one by Greenwich time was always communicated to Portsmouth when the ball fell at Greenwich; the semaphores were ready for the message, and it commonly passed from London to Portsmouth in the acknowledgment back to London within three-quarters of a minute. Each station was in the charge of a naval officer—usually a lieutenant—with one or two men under him. To save the cost of this establishment, the Deal and Plymouth lines fell into disuse soon after the peace of 1815; but the superior advantages of the electric telegraph being incontestable, the Portsmouth line sent its last message on the 31st December 1847, and the land at least, the semaphore closed its career of usefulness for ever. In calm weather, when the wind will not extend, semaphores are employed on board ship as a means of signalling from vessel to vessel, or to the shore; in such a case, the post office arms are movable, and can be readily shipped or unshipped near the stern. See also **SIGNALS**.

SEMÉ, in Heraldry. When a charge is repeated an indefinite number of times so as to produce the

appearance of a pattern, the term *semé* (sometimes *aspered* or *powdered*) is applied to it. When a field is *semé*, it is treated as if it were cut out of a larger extent of surface, some of the charges being divided by the outline of the shield. The term *crusilly* denotes *semé* of cross crosslets, and *billetty* *semé* of billets.

Semé.

SEMECARPUS, a genus of trees of the natural order *Anacardiaceæ*. The MARKING NUT of India is *S. anacardium*, a tree 50 feet high, growing on mountains. The swollen receptacle of the flower becomes a succulent fruit, eatable when roasted, but astringent and acrid when raw. On the receptacle is seated the nut, which is heart-shaped and black, consisting of a kernel—not unwholesome, although rarely eaten—surrounded by two skins, between which is a black acrid juice. This juice is used in medicine as an external application to heal rheumatism, &c. It is also in general use in India for marking cotton cloth; and the colour is improved, and running prevented, by the addition of a little quicklime and water. The wood of the tree contains so much acrid juice that it is dangerous to work upon.

SEMELE. See BACCHUS.

SEMENCINE, SEMEN CINÆ, AND SEMEN CONTRA. See ARTEMISIA.

SEMENDRIA, a frontier fortress of the principality of Servia (q. v.), stands amid romantic scenery on the right bank of the Danube, 28 miles south-east of Belgrade. The inhabitants, about 12,000 in number, are employed principally in the wine-culture, in breeding hogs, and in general trade. It was at one time the seat of the Servian kings; and it has been frequently stormed by the nations who have contended for the Danube from the middle æra to the present century.

SEMI-BREVE, in Music, a note of half the duration of the breve of old ecclesiastical music, but the longest note in use in modern music. It is represented by a character circular or elliptical in

form  and is adopted as the integer or

measure-note, the other notes—minim, crotchet, quaver, &c.—being proportional parts of it.

SEMI-DEMI-SEMIQUAVER, a musical note, of which 8 are equivalent to a quaver, 32 to a minim, and 64 to a semibreve. It is represented thus,

SEMINOLES, a tribe of American Indians, originally a vagrant branch of the Creeks, whose name, Seminole, signifies wild or reckless. In 1705, they aided in driving the Apalaches from Florida; and in 1817, they joined with the Creeks and some negroes who had taken refuge with them, ravaged the white settlements in Georgia, plundering plantations, and carrying off slaves, whom they refused to surrender. General Jackson, sent to punish them, took at the same time several Spanish forts, and hastened the negotiations which ended in the cession of Florida to the United States. At this cession in 1823, the S. engaged to retire into the interior, and not molest the settlers; but as the negroes continued to take refuge with them, a treaty was made with some of the chiefs, in 1832,

for the removal of the whole tribe west of the Mississippi. This treaty was repudiated by the tribe, at the instigation of Osceola (q. v.), one of their chiefs; and a war commenced against a handful of savages, which lasted eight years, and cost thousands of lives, and ten millions of dollars. In the end, the remains of the tribe were removed to the Indian Territory on the borders of Arkansas.

SEMPALATINSK, an extensive Russian territory in Siberia, is bounded on the E. and S. by Tomsk, the Chinese empire, and Turkestan. Area, 138,125 sq. m.; pop. 208,994. It is separated from Turkestan on the south by the Alexandrian Mountains in lat. 42° 30' N., and it is traversed by several other mountain chains. The chief rivers are the Irtysh, Ili, and Chui; and among the lakes are those of Issik-Kul, Ala-Kul, and Balkash. The country abounds in pasturage, and cattle form almost the sole wealth of the inhabitants, although the precious metals, together with lead and copper, are found. Steamers ply on the great rivers and lakes.—Semipalatinsk, the capital, stands on the left bank of the Irtysh, in lat. about 50° 15' N. It is the seat of an important transit-trade, and contains 14,135 inhabitants.

SEMI-PELAGIANISM, a modification, as the name implies, of the doctrine of the Pelagians as to the powers of the human will, and as to the effects to be attributed to the action of the supernatural grace of God, and of the divine decree for the predestination of the elect. The Pelagians (q. v.), discarding altogether the doctrine of the fall of Adam, and the idea that the powers of the human will had been weakened through original sin, taught that man, without any supernatural gift from God, is able, by his own natural powers, to fulfil the entire law, and to do every act which is necessary for the attainment of eternal life. The condemnation of this doctrine by the several councils held in the early part of the 5th c. is capable of various constructions, and has been urged by some to the extreme of denying altogether the liberty of man, and converting the human will into a merely passive instrument, whether of divine grace upon the one hand, or of sinful concupiscence upon the other. The writings of St Augustine on this controversy have been differently construed by the different Christian communions (see PELAGIANS); and the same diversity of opinion existed in his own day. Among those who, dissenting from the extreme view of Pelagius, at the same time did not go to the full length of the Augustinian writings in opposition to Pelagius, were some monks of the southern provinces of Gaul, and especially of Marseille, whence their school was called Massilian, from the Latin name (*Massilia*) of that city. Of these leaders, the chief was a priest named Cassian, who had been a deacon at Constantinople. Of the system which he propounded, without going into the details, although many of them are exceedingly curious and interesting, it will be enough to say that it upheld the sufficiency of man's natural powers only so far as regards the first act of conversion to God and the initial act of man's repentance for sin. Every man naturally possesses the capability of beginning the work of self-conversion; but for all ulterior acts, as well as for the completion of justification, the assistance of God's grace is indispensable. The Semi-Pelagian doctrine is often confounded with that of the Molinistic (see MOLINA) school of Roman Catholic theology; but there is one essential difference, viz., that the latter persistently maintain the necessity of grace for all supernatural acts, even for the beginning of conversion, although they are generally represented as

agreeing with the Semi-Pelagians as to the mode of explaining the freedom of the human will acting under the influence of divine grace. The chief writers in the controversy were Prosper, Hilary, and Fulgentius; and the question was referred to Celestine, Bishop of Rome in 431. It continued, however, to be agitated in the West for a considerable time. Faustus, Bishop of Riez, towards the end of the 5th c., revived the error, and it was condemned in a council held at Arles in 475, and still later in a synod (the second) held at Orange (Arausio) in 525, and again in the third council of Valence in 530.

SEMIPLENA PROBATIO, in Scotch Law, is that kind of half-proof, half-suspicion which was usually given in cases of affiliating a bastard, as well as in a few other cases. It was a species of *prima facie* evidence; and when considered by the court sufficient, it was eked out by the oath of the party, called an Oath in Supplement. The practical effect of the admission of parties as witnesses, under 16 Vict. c. 20, has been to do away with Oaths in Supplement, the parties being usually the principal witnesses, and the court deciding from a consideration of the balance of credibility between them.

SEMIQUAVER, a musical note, represented

thus,  or in groups thus, 

equivalent in value to $\frac{1}{4}$ of a quaver, $\frac{1}{8}$ of a crotchet, $\frac{1}{16}$ of a minim, or $\frac{1}{32}$ of a semibreve.

SEMI-QUIETISM, a form of mystical asceticism which, while it adopts the theoretical principle, that the most perfect state of the soul is that of passive contemplation, and denies, in certain conditions of the soul, the necessity of prayer or other active manifestations of virtue, yet maintains the incompatibility of this passive contemplation with any external sinful or sensual action. The Semi-Quietists thus differed from the grosser sectaries referred to under **QUIETISM**.

SEMI'RAMIS. See **ASSYRIA**.

SEMITIC. See **SHEMITIC**.

SEMITONE, in Music. The name given to the smaller intervals in the diatonic scale, as E F or B C, in which the ratio is as 15 to 16.—In the pianoforte, the interval between any two notes between which no other note is interposed, as C to C \sharp or B \flat to B, is a semitone.

SEMLER, JOHANN SALOMO, one of the most influential German theologians of the 18th c., was born, 18th December 1725, at Saalfeld, where his father was archdeacon, educated at Halle, and in 1749 went to Coburg as professor at the gymnasium. In 1751, he was appointed a Professor of Theology at Halle, where he taught with great success; and six years later, became director of the theological seminary there. He died 14th March 1791. S. was, in the early part of his student-career, somewhat of a Pietist, but the prelections of Sigm. Jak. Baumgarten may be said to have revolutionised his religious convictions, and swung him round to rationalism, of which he was the first systematic exponent. S.'s rationalism, however, was always moderate in degree, though definite enough in kind. As a thinker, he was deficient in philosophical consistency and breadth of view; and as a writer, he possessed no literary skill or grace; but his works are valuable for the spirit of historical criticism by which they are pervaded. The principal are: *Apparatus ad liberalem Veteris Testamenti Interpretationem* (Halle, 1773), *Abhandlung von der Untersuchung des Kanons* (4 vols., Halle, 1771—1775), *De Dæmoniis* (Halle, 1760), *Umständliche*

Untersuchung der Dæmonischen Leute (Halle, 1782), *Versuch einer Biblischen Dæmonologie* (Halle, 1776), *Selecta Capita Historiæ Ecclesiasticæ* (3 vols., Hal. 1767—1769), *Commentationes Historiæ de Antiquo Christianorum Statu* (2 vols., Halle, 1771—1772), *Versuch Christlicher Jahrbücher oder annalen. Tabellen über die Kirchengeschichte bis a. d. J. 1500* (2 vols., Halle, 1783—1786), *Observationes, quibus Historia Christianorum usque ad Constantinum Magnum illustratur* (Halle, 1784), *his Lebensbeschreibung von ihm selbst verfasst* (Halle, 1781—1782), Wolf, *Ueber Semler's letzte Lebensjahre* (Halle, 1791), H. Schmid, *Theologie Semler's* (Stuttgart, 1858), and Tholuck in his *Vermischten Schriften*.

SEMLIN, a frontier town of Austria, in the Military Frontier, stands on a tongue of land at the junction of the Save and Danube, on the right bank of the latter, opposite Belgrade. Within recent years the town has been much improved, though it is yet a suburb consisting of mud huts thatched with reeds stretches along the Danube. The only noteworthy edifices are the churches, the German church, and the Lazaretto (*Contumax*), the chief quarantine station in the whole of the Military Frontier. At this institution, travellers crossing from Turkey are compelled to remain a greater or less time—sometimes 40 days—in proportion to the violence or proximity of the plague. The reason why the principal Lazaretto is here is, that S. is the principal seat of the Turco-Austrian transit-trade, and the principal ferry for passengers from Christendom to the land of the Moslem. Pop. (1869) 8915.—For graphic notices of S., see Kinglake's *Roths*.

SEMMERING, a mountain on the border of Styria and Austria, and 44 English miles south-west from Vienna, is 4416 feet above the level of the sea. The Vienna, Grätz, and Trieste Railway has been carried across this mountain by a series of ingenious engineering contrivances. See **GLOUVER**.

SEMNOPITHECUS, a genus of monkeys, natives of the East, having a very long, skinned, powerfully muscular, although not prehensile tail. The canine teeth are long, but the molar teeth are more tuberculous than in Gibbons (q. v.) and other allied monkeys, indicating a greater aptitude for vegetable food. With this structure of the stomach corresponds, which is very remarkable, and different from that of all other monkeys, consisting of a cardiac pouch, slightly bifid at its extremity; a very wide middle portion, formed of numerous pouches or sacs; and a very long, narrow, furnished with sacs at its commencement, leading simple towards its termination. Professor Owen has been careful, however, to point out that these three portions do not correspond to any of the parts of the stomach of a ruminant animal, not exhibiting any such diversities in their internal surface. The species are numerous. The Entellus (q. v.) is one of them. Another is the Negro Monkey (*Maurus*) of Java, remarkable for its jet-black coat and long silky hair.

SEMOLINA (Semola or Semoule), an article of food much used in France and Italy, and to a small extent in Britain, and other countries. It consists of particles of wheat varying in size from that of sand to small millet. Only the hard, granular wheats of Spain, Odessa, and Southern Italy are adapted for making it; these hard wheats are not easily reduced to flour, and small particles escape being crushed by the mill-stones, and do not pass through the sieves that crush the softer semolina. In France, more attention is paid to this article than in any other country; and as it fetches a higher price than flour, the whole

millers so adjust his mill-stones as to produce a considerable quantity. The granules of semolina are of various sizes, and they are carefully separated by sieves, the openings of which are from fine to coarse. A favourite kind of bread made of the coarser kinds of semolina—the *semonle* of the French—is sold in Paris under the name of *gruau*. In Italy, it is used in making polenta, in common with maize, meal, and millet; and in Britain it is used for puddings.

SEMPACH, a small town of Switzerland, in the canton of Lucerne, and 9 miles by railway north-west of the town of that name, stands on the east shore of the lake of Sempach. It is surrounded with walls, now in a ruinous condition, has a population of a little over 1000, and was one of the outposts of the confederate cantons against their Swabian and Austrian assailants in the 14th century. Under the walls of S. took place the second great conflict of the confederated Swiss cantons with Austria. Leopold's army of 4000 horse and 1400 foot arrived before S. on the 9th July 1386, and found itself unexpectedly opposed by the confederated Swiss to the number of 1300. The nature of the ground being unfitted for the action of cavalry, the knights dismounted, and formed themselves into a solid and compact body, which was at once charged by the Lucerners; but the wall of steel was impenetrable, and not a man of the Austrians was even wounded, while 60 of the bravest of Lucerne with their landamman fell. The mountaineers were beginning to despair of making an impression on their apparently invulnerable opponents, when Arnold von Winkelried, a knight of Unterwalden, seized with a noble inspiration, rushed forward, grasped with outstretched arms as many pikes as he could reach, buried them in his bosom, and bore them by his weight to the earth. His companions rushed over his body into the breach thus made, slaughtered the armour-encumbered knights like sheep, and threw the remainder into the utmost confusion and dismay. The conflict continued in an irregular manner for some time longer, but the result was a decisive victory for the Swiss, who had lost only 200 men; while the loss of the Austrians was ten times as great, including 600 counts, barons, and knights. The body of Duke Leopold, who had throughout displayed the most obstinate valour, was found next day buried among a heap of slain. The anniversary of this great victory is still celebrated by prayer and thanksgiving on the field of battle.

SEMPERVIVUM. See **HOUSE-LEEK**.

SENATE. See **ROME**.

SENATUS ACADEMICUS, one of the governing bodies in the Scottish universities, consisting of the Principal and Professors. It is charged with the superintendence and regulation of discipline, and the administration of the university property and revenues, which last function, since the Universities Scotland Act of 1858, the *Senatus* exercises subject to the control and review of the University Court. Degrees are conferred by the *Senatus* through the Chancellor or Vice-chancellor. The Principal is president, and besides his deliberative vote, has a casting vote. In his absence, the senior professor present acts as chairman, who has also a double vote. One-third of the *Senatus* is required to form a quorum.

SENDOMIR or **SANDOMIR MOUNTAINS.** See **RADOM**.

SENECA, M. ANNÆUS, the rhetorician, was born at Corduba (Cordova) in Spain. The time of his birth is doubtful, probably about 61 B.C. He seems to have been in Rome during the early period

of the power of Augustus. He was rich, belonged to the equestrian order, and enjoyed the friendship of many distinguished Romans. From Rome he returned to Spain, where he married Helvia, and had by her three sons. The time of his death is uncertain; but he probably lived till the close of the reign of Tiberius, and died in Rome or Italy. His extant works are *Controversiarum Libri X.*, and *Suasoriarum Liber*, neither of which is complete. They are elaborately rhetorical in style, but do little to support the fame of their author, who is more remembered for his prodigious memory than for anything else.

SENECA, L. ANNÆUS, son of the preceding, and a celebrated philosopher, was also born at Corduba, a few years B.C. When a child, he was brought by his father to Rome, where he was initiated in the study of eloquence. He cared more, however, for philosophy, in which his first teacher was the Pythagorean Sotion, whom he afterwards left to follow Attalus the Stoic. He travelled in Greece and Egypt; and, in obedience to his father's wishes, he pleaded in courts of law; but notwithstanding his forensic triumphs, he left the bar from fear of Caligula's jealousy. On entering into public life, he filled the office of quaestor, and had already risen high in the favour of the Emperor Claudius, when he was accused of an adulterous connection with Julia, the daughter of Germanicus, and wife of Vinicius. He was exiled to Corsica, where he remained for eight years, deriving from philosophy what consolation he could, while incessantly complaining with a by no means philosophic querulousness, and appealing to the emperor for pardon. When Claudius married his second wife, Agrippina, S. was recalled by her influence, raised to the praetorship, and appointed instructor of her son Nero. On the death of his governor and military tutor, Burrus, Nero gave way to his depraved passions with a force which S. could not control. All his influence over his pupil was lost, but he profited by his extravagant bounty to such a degree that his accumulated wealth amounted to 300,000 sester tia, or to £2,421,870 of our money. Nero soon began to look with envious eyes on this fortune; and S., to avert dangerous consequences, offered, with much tact, to refund to the emperor his gifts, and begged leave to retire on a small allowance. This Nero declined; and S., under pretence of illness, shut himself up, and refused to appear in public. Nero then attempted to have him poisoned, but failed. A short time afterwards, Antonius Natalis, when on his trial for participating in the conspiracy of Piso, implicated S. as one of the conspirators. This was quite enough to fix S.'s guilt. He was sentenced to put himself to death. His wife, Paullina, declared her resolution to die with him, and, in spite of his remonstrances, accompanied him into the bath in which, according to his own choice, he was to be bled to death. The emperor, however, would not allow Paullina to die, but removed her from her husband, who gradually expired, 65 A.D. S.'s extant writings are mainly on moral subjects, and consist of Epistles, and of treatises on Anger, Consolation, Providence, Tranquillity of Mind, Philosophical Constancy, Clemency, The Shortness of Life, A Happy Life, Philosophical Retirement, and Benefits. He also speculated on physical phenomena, and wrote seven books entitled *Quaestiones Naturales*, in which he is thought to have anticipated some notions regarded as principles in modern physics. Ten tragedies, ascribed to him by Quintilian, and generally included in editions of his works, have also come down to us; but whether he is really their author remains still a dubious and debated point. Some allege that they were the

work of his father, Seneca the rhetorician; some that they must be attributed to another Seneca. They were not intended, and are certainly not adapted for the stage. They are overcharged with declamation; and, if rich in moral sentiments, are wanting in dramatic life. Of his genuine prose writings, modern opinion takes a divided view; some critics praising his practical sagacity, others finding him wanting in speculative reach. It is perhaps a significant fact, that he is admired by French scholars, and disparaged by German. One of the best editions of the prose works is the Bipontine, 1809; of the tragedies, that of Bothe, 1819.

SENECA LAKE, one of a range of narrow lakes in the western part of the state of New York, U.S. It is 37 miles from north to south, and from 2 to 4 miles in width, 441 feet above the Atlantic, 630 feet deep, and was never known to be frozen over until March 1856. It is navigated by steamboats from its head to the pretty village of Geneva at its mouth, and empties itself by the Seneca and Oswego rivers into Lake Ontario. It takes its name from the Seneca Indians, one of the Six Nations.

SENECIO, a genus of plants of the natural order *Compositæ*, suborder *Corymbifera*, having a hairy pappus, a naked receptacle, and a cylindrical involucre of linear equal scales, with a few smaller scales at their base. The species are very numerous; annual, perennial, and half-shrubby plants, natives chiefly of the temperate and cold parts of the world, the half-shrubby species being from the warmer latitudes. Eleven species are reckoned as British, and commonly known as Groundsel (q. v.) and Ragwort (q. v.). *S. Saracenicus*, probably not a true native of Britain, but introduced in the middle ages, has undivided lanceolate leaves, and was once in repute as a vulnerary. The FIREWEED of North America is *S. hieracifolius*. It receives its popular name from its appearing abundantly wherever a part of the forest has been consumed by fire. Many species of *S.* have a strong disagreeable smell. A few are rather ornamental as flowers.

SENEFFE, or **SENEF**, a town in the province of Hainault, Belgium, about 11 miles north-west of Charleroi, has a pop. of between 3000 and 4000, and is the centre of a district in which manufactures of pottery and glass are extensively carried on. *S.*, however, is chiefly notable for its proximity to the battlefield on which William of Orange (III. of England), at the head of the forces of the coalition against France, was defeated, after a bloody contest, by the Great Condé, 11th August 1674. In William's army there were four lieutenants—Montecuculi (q. v.), Duke Charles of Lorraine, the Prince of Waldeck, and the Prince of Vaudemont, the first three of whom subsequently attained prominence as military commanders. Of the allied forces of 60,000 men, the Dutch lost from 5000 to 6000 men, the Spaniards 3000, and the Imperialists 600; while the French army, which entered into the conflict 30,000 strong, could scarcely muster 20,000 after their victory.—Under the walls of *S.*, Moreau, in 1794, defeated the Austrians.

SENEGA or **SNAKE ROOT** is the dried root of *Polygala Senega*. The following are its characters: 'A knobby root-stock, with a branched tap-root of about the thickness of a quill, twisted and keeled; bark, yellowish-brown, sweetish, afterwards pungent, causing salivation; interior, woody, tasteless, inert.' *Senega* is a powerful and trustworthy stimulating expectorant, and may be advantageously prescribed in the advanced stages of chronic bronchitis and pneumonia, especially when occurring in aged or very debilitated patients. It is also a valuable

remedy in prolonged hooping-cough, and in the latter stages of croup and of bronchitis in young children. The preparations are the infusion, the Tincture; the average dose of the former being an ounce and a half, of the latter a drachm. For children, the powdered root in doses of ten grains is the best form. See *POLYGALA*.

SENEGA'L (called by the natives *Senegal*), a large river in Western Africa, rises in Mount Coré in lat. 10° 30' N., long. 10° 40' W., flows first north-west and then west, and falls into the Atlantic after a course of 1000 miles, for the last 740 of which it is navigable for flat-bottomed boats. Here and there throughout the whole course, the navigation is interrupted by cataracts, shoals, and rocks. In the lower course, the river forms numerous large cultivated, and very fertile islands, and its banks are green and productive, and in part clothed with wood. The entrance is difficult on account of breakers and a bar which, in the dry season, is covered by only 8 to 9 feet of water.

SENEGAL, the name of the French possession on the river Senegal in Senegambia (q. v.).

SENEGAMBIA, a large maritime tract of country in Western Africa, in lat. about 10°–15° N., long. about 4°–17° 30' E., is bounded on the N. and W. by the Sahara and Sudan, on the E. by the colony of Sierra Leone, and on the W. by the Atlantic. Area about 400,000 sq. m.; population estimated at about 12,000,000. The country takes its name from its two principal rivers, the Senegal and the Gambia. Between these two rivers, which are 250 miles apart, there are no water courses of any importance, and from the Gambia south to the frontier of Sierra Leone, the only considerable stream is the Rio Grande. The coast is deeply indented by arms of the sea, which reach the estuaries of rivers. The country forms the western and northern declivity of the plateau of Kong, and part of it is still unexplored. The whole of two kinds, that of the coast and that of the interior: the former consisting in part of low alluvial plains, and partly of an undulating country which broadens toward the north, until, on the northern frontier, it merges into the Sahara; while the plateau of the interior rises from the coast plains in mountainous terraces, until it loses itself in the Kong Mountains. Its loftiest elevations are only about 3280 feet high. *S.* is divided into three districts—High, Middle, and Low Senegambia. The first comprises the country to the north of the Senegal, and is inhabited by Moors, who, of course, profess Islamism. Middle *S.* comprises the countries bordering the Senegal, having an area of 100,000 sq. m., and is inhabited by Negroes, who divide themselves into numerous tribes. Of this tract the climate is extremely hot, and is unhealthy in the marshy districts. The soil is generally fertile, and yields the crops usually produced in the hot parts of Africa. Low *S.* comprises the countries bordering the Gambia, and extends south to Nunez. On the coast-regions of *S.*, France possesses on the island and around the estuary of the Senegal about 14,000 sq. m. of territory; the Portuguese, a tract of 30,000 sq. m., on and around the estuary of the Rio Grande; and the English some little territory on the Gambia, with a pop. of 14,190.

SENECHAL (Teuton. *senes-calc*, senior servant?), in the origin of the office, probably an attendant of the servile class who had the superintendence of the household of the Frankish king. In the course of time, however, the *seneschal* rose to be a position of dignity, held no longer by persons of servile race, but by military commanders who were also invested with judicial authority. The

lieutenants of the great feudatories often took the title of *seneschal*. A similar office in England and Scotland was designed steward, but is rendered into Latin as *senescallus*.

SENIOR, NASSAU WILLIAM, political economist, born 1790, eldest son of Rev. J. R. Senior, vicar of Durnford, Wilts, was educated at Eton, and Magdalen College, Oxford, where he graduated in 1811, taking a distinguished first-class in classics. In 1819, he was called to the bar at Lincoln's Inn. In 1823, he was elected to the professorship of Political Economy at Oxford, founded by the late Henry Drummond, M.P. He held it for the statutory term of five years, and was succeeded by Mr Whately, afterwards Archbishop of Dublin. In 1832, the enormous evils of the poor-law administration in England led to the appointment of a Commission of Inquiry. S. was one of the commissioners; and the portion of the Report in which the abuses of the existing system were detailed, was drawn up by him. This Report encouraged the Whig government to bring in the Poor-law Amendment Act of 1834. See POOR AND POOR LAWS. In 1836, he received the appointment of Master in Chancery; and in 1847, was re-elected to his former professorship for another term of five years. More recently, he was nominated one of the commissioners of National Education, under the presidency of the late Duke of Newcastle. His publications, which are numerous, comprise various excellent treatises on political economy, some of which were delivered in the form of lectures at Oxford, and several pamphlets on social and political questions. He also contributed numerous articles to the *Edinburgh Review*, and other leading periodicals. He has left some interesting journals of his visits to Turkey and Greece, and observations on the political and social condition of these countries. His *Essays on Fiction*, contributed to the chief reviews between the years 1821 and 1857, and republished in 1864, relate principally to the novels of Scott, Bulwer Lytton, and Thackeray. He analyses the plots, and classifies the characters of the Waverley novels with various felicity, and devotes a masterly essay to Thackeray, whom he regards as the greatest novelist of his day. The intellect of S. was clear and penetrating, and the perspicuity of his style made him an able expositor of the truths of political and social science. His article on 'Political Economy' in the *Encyclopædia Metropolitana*, and his remarks on some definitions in this science, published in the appendix to Dr Whately's treatise on *Logic*, may be consulted with advantage. He died June 4, 1864.

SENLIS, a very ancient town of France, dep. of Oise, 33 miles north-north-east of Paris. Its chief portion is surrounded by walls, flanked with 16 towers, which are all that remain out of the 28 towers of early times. The cathedral, a small edifice, is a beautiful example of early Gothic. Manufactures of cloth, lace, and thread are actively carried on. Pop. (1872) 5329.

SENNA is one of the most important purgatives obtained in our *Materia Medica*. Two sorts of senna are recognised in the *Pharmacopœia*—viz., Alexandrian senna and Tinnevely senna. The Alexandrian senna leaves are chiefly obtained from *Cassia lanceolata*, while the Tinnevely senna leaves are yielded by *Cassia elongata*. *Alexandrian senna* is chiefly grown in Nubia and Upper Egypt, and is exported in large bales from Alexandria. It is apt to be adulterated largely with the flowers, pods, and leaves of *Cynanchum argel* and *Tephrosia polinea*. *Tinnevely* or *East Indian senna* in

odour and taste entirely resembles Alexandrian senna. The leaflets are, however, 'about two inches long, lanceolate, acute, unequally oblique at the base, flexible, entire, green, without any admixture.'

Senna is, as Dr Christison observes in his *Dispensatory*, 'so certain, so manageable, and so convenient a purgative, that few remedies of its class are held in equal estimation. In point of energy, it holds a middle place between the mild laxatives and drastic cathartics. It acts chiefly on the small intestines, increasing their mucous secretion, as well as their peristaltic motion, and producing loose brown evacuations.' The drawbacks to its more universal administration are its disagreeable taste, and its tendency to produce nausea, griping, and flatulence; the means of correcting which are subsequently noticed. The only circumstance positively contra-indicating its employment is an inflammatory state of the intestinal mucous membrane. Although senna has been frequently submitted to chemical analysis, its active principle is not known; but whatever the cathartic principle may be, it is obviously absorbed into the circulation before it begins to operate, since this drug imparts a purgative property to the milk of nurses.

The following are the most important preparations of this medicine:

1. *Infusion of Senna*, which is obtained by infusing for one hour, and then straining, half an ounce of senna and half a drachm of sliced ginger in half a pint of boiling water. The taste of this infusion is much concealed by the addition of some black tea, or what Neligan finds 'still better, coffee, and it may be sweetened with sugar, and milk added; it is in this way readily taken by children.' The addition of neutral laxative salts checks the griping, which is often caused by senna alone, and at the same time increases its activity. The ordinary *Black Draught* is commonly prepared by adding one ounce of sulphate of magnesia to four ounces of infusion of senna. Two or three ounces of this mixture, to which a drachm each of the tinctures of senna and of cardamoms may be added, usually act as a very useful aperient.

2. *Tincture of Senna*, composed of senna, raisins, caraway seeds, and coriander seeds macerated in proof-spirit, and formerly known as *Elixir Salutis*, or *The Elixir of Health*, is seldom given alone. Christison recommends a mixture of an ounce of the tincture of senna with an ounce and a half of sulphate of magnesia, dissolved in four ounces of water, and as much infusion of roses. 'A wine-glassful of this given every hour seldom fails to act with energy, and without sickness or tormina, and is an excellent combination for most febrile disorders.' The tincture is, however, most commonly prescribed in doses of one or two drachms, as an adjunct to other cathartic mixtures, to correct their griping properties.

3. *Confection of Senna*, commonly known as *Lentive Electuary*, is a pulpy mixture of powdered senna with powdered coriander seeds, figs, tamarinds, cassia pulp, prunes, extract of liquorice and sugar; all of which substances are, under certain specified conditions, combined by the action of boiling water. When properly prepared, which is often not the case, it forms a mild aperient, well suited for persons suffering from piles.

In the above preparations, it is immaterial whether Alexandrian or East Indian senna is employed.

The senna leaves of commerce and of medicine are the produce of several species of *Cassia* (q. v.), natives of India, Arabia, Myria, and the north of Africa. *Cassia obovata* is a perennial herbaceous
